*The public at large has a claim over the architecture of a country. It is common property, inasmuch as it involves the national taste and character; and no man has a right to pass himself and his own barbarous inventions as a national taste, and to hand down to posterity his own ignorance and disgrace to be a satire and a libel on the knowledge and taste of his age.*

## AND CONTRACT REPORTER.

A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

### THE WEEK.

THE late Sir NOEL PATON is to be respected as having executed his life's work in a thorough way and with advantage to his countrymen. He was possessed, too, of the accompaniments of a happy old age, honour, love, obedience, troops of friends. His removal can therefore leave no discontent. When the circumstances of his youth are taken into account his success was remarkable. The son of a designer for damasks, in his fifteenth year he possessed enough technical skill to be employed as a draughtsman for embroidered muslin. But he endeavoured to strengthen his latent powers, and in his twenty-second year he had the courage to come to London in order to study at the Academy schools. He did not remain long there, and he might be numbered among the self-taught artists. A year or two afterwards he obtained a premium for a cartoon called the *Spirit of Religion*, sent in for the competition for the decoration of the Houses of Parliament. At the time SAMUEL CARTER HALL was one of the shrewdest judges of a painter's abilities, and by engaging PATON to design fairies and elves for Mrs. HALL'S "Midsummer's Eve," he recognised the class of work in which the artist was then most competent. Several fairy scenes were painted by PATON, and in the posing of the figures it was easy to perceive the influence of MACLISE. The chivalrous incidents showed tendency in the same direction. But the religious spirit was also strong with NOEL PATON, and if one of his sonnets can be taken as a revelation of his own mind, it is evident that he preferred FRA ANGELICO as a painter to RAPHAEL or MICHEL ANGELO. His numerous religious pictures are didactic, and, as they were exhibited in a great many towns, they made the artist's name known throughout the country. Some of them may be condemned as going beyond pictorial limits, but they were painted for "grave livers" like those abounding in Scotland rather than for the multitude. Sir NOEL PATON was an honour to his native land, and his name will long live among her famous sons.

AMERICAN artists have a chance from this week forwards of obtaining public patronage. The Act which was passed for the appropriation of funds to purchase works by American artists was doomed to be inoperative by the Tammany combination. Under the improved administration the intention of the Legislature will, it is hoped, be realised. By the Act first-class cities can expend 10,000% in a year on mural paintings, mosaics and stained glass, and second-class cities 5,000%. The works are to be selected by the Art Commission of each city, but will have to be approved by the Municipal Art Commission. There is a growing love of art in the United States, and many modern buildings have been enriched in consequence, but the paintings and sculpture were allowed as examples of architectural decoration, and in that way became part of the building. Under the new Act it will be possible to have adornment of a supplementary class.

WE published last week the clause relating to the deposit of elevations of buildings proposed to be erected which the Belfast Corporation had introduced in their "Omnibus" Bill. Owing, we presume, to the dread of opposition to a scheme which would constitute the surveyor

of Belfast and the Recorder the sole judges of architectural designs, a slight modification has been made in the Bill as deposited. It is now said, "The Corporation may disapprove of such elevations on the ground that the same are in their opinion objectionable, or that in any respect they are not in conformity with the requirements or provisions of the existing local Acts or by-laws of the Corporation," and any person "aggrieved by a decision of the Corporation as to such elevations may appeal to the Recorder against such decision, whose decision thereon shall be final." A comparison of the clause in its original and modified forms will show that the only alteration is the substitution of "Corporation" for "surveyor." We need not say that in reality the clause remains as it was first announced. The Corporation in such cases as the approval of designs would be guided by the report of the surveyor, and the disapproval, although nominally coming from the corporate body, would be expressive of the surveyor's notions about architectural design. We print in another column the opinion of counsel on the subject. It will be seen that Mr. MURRAY is of opinion that there can be no case made out by the Ulster Society of Architects, and they will be justified in opposing the Bill. But it will be better to remember that their action will be as architects of Belfast who are likely to suffer through the clause, for architects in other cities or towns would not be recognised as having a *locus standi* before a Parliamentary committee.

AMONG modern English etchers DAVID LAW, who died at Worthing on Saturday, held a prominent place. He was one of the few men who employed etching for original composition. DAVID LAW was a landscapist, and although deprived by his mode of representation of the advantages of colours, he produced many plates which were typical of English country districts. By birth he was a Scotsman, and some of his water-colour drawings were taken from northern landscapes. He produced some plates after TURNER, but he would have been the most successful translator of DAVID COX's works if he had made the experiment. He had a partiality for clouds, and was able to render them with more effect than any of his later contemporaries.

MASONRY bridges are now rarely constructed, especially in the form of single arches. Steel has taken their place. The Pont y Pridd, in Wales, which has a span of 140 feet, remained for many years a triumph of construction. BRUNEL endeavoured to equal it by a flat arch in brick, but he could only attain a span of 120 feet. The new bridge which was lately constructed at Luxembourg is 275 feet in span. In the course of the construction a professor of engineering construction in Switzerland deemed it his duty to announce that the working stresses in the arch were beyond the crushing limit of stone. The engineers, however, did not alter their sections, and they are sure that the span might have been increased without any risk to the public. The settlement on removing the centres was only about one-fifth of an inch. In appearance masonry bridges can be made superior to those constructed of iron and steel. But in most positions there is a difficulty about the rise, and greatly inclined roadways are less in favour since motor cars and traction engines came into use than formerly

## RIPON CATHEDRAL.

*See Illustration.*

RIPON is separated geographically from Chichester by several miles, but there is no unfitness in the illustrations of the former following those of the latter cathedral in our series. The reason is that both in a peculiar degree exemplify the marvellous activity of St. WILFRID in the seventh century. In him the spirit of the first Apostles appeared to have been revived. He is sometimes described as a descendant of a noble family, but according to GODWIN, "he was born of mean parentage in the North of England, and untaught till he arrived at the age of fourteen years; that then, not enduring the frowardness of his stepmother, he went to seek his fortune, in which adventure, meeting with certain courtiers who had been obliged to his father for some courtesies, they presented him to the queen, whom from his wit and beauty he was not unfit to serve, who, finding his inclination to learning, sent him to CHAD (formerly chamberlain to the king), then a monk at Lindisfarne, by whose dexterous instructions he became a great proficient in scholarship; where, affecting a monastic life, and being of a quick apprehension, he learned the Psalms and some other books, but was not shorn, though he much exceeded his ecclesiastical superiors in knowledge, being not a little notice taken of and esteemed for his humility and obedience. Having served many years in that monastery he resolved to go to Rome." It is probable that his voyage to Rome was in connection with the difficulty of determining the period of Easter, which was then a subject that seemed to be likely to become a war cry among ecclesiastics.

In Rome he received attention from the Pope, and, as might be expected, left the city with the determination to extend the Roman rule or principle of unity. On his way through France an effort was made to secure his services for the church in Lyons, but WILFRID felt that his mission was among the Saxons in Britain. A man who had visited Rome must have gained repute and be thought qualified to exercise authority in the seventh century, and therefore WILFRID soon obtained a grant of land from the King of NORTHUMBRIA for Ripon, where a monastery existed, in which he became abbot. In 661 WILFRID was ordained a priest within his monastery; he was afterwards in a position to take part in a conference that was held at Whitby in 664 concerning the Easter question. He opposed the clergy of Scotland and Ireland. The king was convinced of the narrowness of the Celtic theory, and resolved to adopt the Roman method. The bishopric of Northumbria, with its principal church in York, was then vacant and the young abbot was selected to be the bishop. He was consecrated by AGILBERT, who had ordained him, and who after serving as Bishop of the West Saxons had become Bishop of Paris. On his return from Paris WILFRID was driven by a storm on the Sussex coast, where he was attacked by wreckers, and until his vessel was able to be refloated he and his party had to sustain the murderous efforts of the barbarians.

WILFRID was not allowed to have peaceable possession of the chair in York. Those who were in favour of the old ways set up a rival, but WILFRID used the opportunity for visiting several parts of England, and it would seem as if Ripon thus became a missionary centre. From what he saw abroad he could not fail to be dissatisfied with the churches where he preached during his journeys. Accordingly, when York was restored to him he was at great pains to improve the cathedral. Nor was he forgetful of the claims of Ripon, and he there erected a church which at the time was regarded as a wonder. We may assume that in the seventh century the English churches were commonly of timber construction, and as it was likely that large pieces were employed, their appearance was very different from what we see in the poverty-stricken structures which in our time serve for temporary use. But like the calculation of Easter, wooden churches were, we have no doubt, regarded as signs of independence of Roman control. In the eyes of such a prelate as WILFRID they would be unorthodox, and he would endeavour to substitute another style of building which would recall Rome rather than Scandinavia, with its mythology that was not foreign to the Saxon mind. It is to be regretted that we

cannot do more than speculate about the character of the building at Ripon which exemplified WILFRID's ideas of a true Christian church. From what is said about the use of dressed stone, columns and arches, as well as from a crypt or confessor forming a part of it, and from its dedication to St. PETER, we can imagine it to be as close an approximation to a Roman church as could be attempted in so remote a district as Ripon.

It must have been a proud day for WILFRID when the dedication was held. On the occasion he presented to the monastery a copy of the Gospels, some books with tablets which were covered with gold and jewels. But WILFRID was not destined to remain in peace at Ripon or at York. A new division was made of ecclesiastical Northumbria without consultation with him, and in consequence he took another journey to Rome to assert his rights. This step displeased the king, and the bishop accepted the exile which followed for again undertaking a missionary tour. It was then he renewed his acquaintance with Sussex. He visited Selsea and there found a refuge. He brought his knowledge of practical life to bear on the inhabitants, and as became a Benedictine instructed the people in agriculture. He built a stone church or cathedral there also which was likewise dedicated to St. PETER. WILFRID was recalled to Ripon. The question of the division of the diocese, however, again arose, and again he had recourse to Rome. Eventually it was decided that he should become Bishop of Hexham, while still retaining authority in Ripon. In 709 he died in the monastery of Oundle, and his body was buried in Ripon Church. The building is now supposed to be dedicated to St. WILFRID as well as to St. PETER.

It was not to be expected that a church in such a district should have an immunity from the exactions of various Norman invaders. WILFRID's church must have suffered occasionally, but in the tenth century it found a protector in King ATHELSTANE, who allowed to it the privilege of sanctuary. The building endured until the middle of the tenth century, and then, as a punishment of the Archbishop of YORK, it was destroyed. It is not certain when the church was rebuilt. But as some if not all of the bones of WILFRID were assumed to be preserved, probably not many years were allowed to elapse before erecting a church to contain the shrine. A period followed in which there is no record of Ripon Church. At the time of the Conquest, THOMAS of Bayeux obtained the see of York, and he appears to have lived occasionally at Ripon.

The churches at that time could hardly have been satisfactory to the Norman prelates. Like WILFRID four centuries earlier, they were anxious to have stone buildings but of a mightier form, which would be in keeping with their own notions of authority. One of them, Archbishop ROGER of York, must always be connected with the history of Ripon. His name has been revived in modern times, for TENNYSON has introduced him as a prominent character in his "Becket." The Archbishops of Canterbury and York are represented as old enemies, for BECKET is made to say:—

Roger of York,  
When I and thou were youths in Theobald's house,  
Twice did thy malice and thy calumnies  
Exile me from the face of Theobald.  
Now I am Canterbury and thou art York.

To this ROGER replies:—

And is not York the peer of Canterbury?  
Did not Great Gregory bid St. Austin here  
Found two archbishoprics, London and York?

At the time it might have been necessary to uphold the rights of York regardless of sacrifices. With all his arrogance, Archbishop ROGER was a generous lover of architecture. The great crypt at York still expresses his aspirations; he also lived to complete a choir above the crypt. At Ripon he rebuilt the church, and the transitional work which will be seen in the illustrations which are to follow must be credited to him. During the episcopate of WALTER DE GRAY at York the west front was erected, with the towers, which were surmounted by timber spires, additions that were indispensable to give elevation to a building that somehow appears to be exceptionally low. In the thirteenth century Gothic underwent

remarkable developments, and when Archbishop JOHN presided in York the east end of the choir was rebuilt in the new mode, now generally known as the Decorated style. The interest taken by so many archbishops in Ripon is extraordinary. Their duties were best served by residing at York. That Ripon was used as a secluded residence is hardly sufficient to explain the expenditure of so much money on the church, and it may be that large sums were also needed for the monastic buildings. There were many parish churches in the archdiocese of York which also called for assistance. The favour shown to Ripon can only be accounted for on the supposition that the clergy or canons living there performed duties of which the records have not survived. By degrees the archbishops' preference seems to have diminished, and in the beginning of the fourteenth century the absence of protectors was exhibited in an unusual way.

In 1318 some Scottish troops were able to enter England. The clergy and people of Ripon, by the payment of 1,000 marks, secured the safety of the place, but on a second visit it was found impossible to collect any more money, and the church and houses in the town were set on fire. It was only after the victory of EDWARD III. at Gladesmore that efforts were made to rebuild the monastery and minster, the latter, according to DUGDALE, "being raised anew almost from its very foundation, and erecting thereon three tall spires of more beauty than those before." In 1375 there was a fire which caused much damage. In the next century it was necessary to rebuild the south and east-walls of the tower and parts of the south transept and choir. In the beginning of the sixteenth century the nave had to be reconstructed, but the aisles were not completed at the time of the Dissolution, and were only roofed with timber.

RICKMAN said that Ripon contained "various parts well worthy of attention, particularly its west front, which is a very fine specimen of bold Early English, and, except the battlements and pinnacles, without alteration." He appears to have judged the building by the exterior as seen from one point of view. Ripon, in fact, exemplifies the evolution of architecture from Norman to Perpendicular, and on that account it is one of the most interesting churches in England. If looked upon simply as a collegiate church, and one which provided for parishioners, it is remarkable. It is cruciform on plan, and has an internal length of 266 feet 5 inches, of which the choir measures about 100 feet. The transepts are 132 feet in length, and the width of nave and aisles is 87 feet.

The area is not too limited to serve for cathedral purposes. In the early history of the church it acquired somewhat of an anomalous character, for it appeared to be intended to serve for more than monastic or parochial purposes. In the controversies which arose around WILFRID a bishop was appointed, and he ruled at least nominally for five years. Eleven and a half centuries had to elapse before it was judged desirable to have a second bishop. By abstracting parts of the diocese of Chester and York a bishopric was arranged in 1836, and Dr. CHARLES THOMAS LONGLEY, head-master of Harrow School, was selected for the office.

### ARCHITECTURE IN 1901.

IN architecture, as in all other spheres of British activity, the most prominent event of the past year has been the passing away of

HER LATE MOST GRACIOUS MAJESTY QUEEN VICTORIA.

Of the part that Her late MAJESTY played and would have played if the feeling of the nation had permitted in the world of art we have already spoken. Architecture indeed has made great progress during the past reign, but would doubtless have advanced still further in common with other forms of art had not the artistic instincts of the late QUEEN and her PRINCE CONSORT been chilled as we have pointed out. Architecture must be grateful to the memory of the departed monarch for good intentions if not for potent encouragement.

THE NATIONAL MEMORIAL TO THE LATE QUEEN has been the subject of much heart-burning and of legitimate animadversion on the procedure of the com-

mittee appointed by the KING to determine the details of the enterprise. In particular the action of the sub-committee—consisting of Viscount ESHER, LORD WINDSOR, Major-General Sir ARTHUR ELLIS, Sir EDWARD POYNTER, Mr. A. B. FREEMAN-MITFORD, Mr. W. EMERSON and Mr. SIDNEY COLVIN—in restricting the opportunity of competing to Mr. T. G. JACKSON, Mr. ASTON WEBB, Mr. ERNEST GEORGE, Sir THOMAS DREW and Dr. ROWAND ANDERSON amongst architects, and in selecting without any competition Mr. THOMAS BROCK as sculptor, has, by its callous tactlessness wounded the loyalty and legitimate ambition of artists throughout the Empire. They would cheerfully have given their time and their brains, had they been permitted, to testify their affection and to offer the finest tribute that the art of all the Britons could produce. It is no derogation to the position of those whom the sub-committee have selected to say that there are many architects whose ability is known to be equal to that of the chosen, and many sculptors who are known to be equal to Mr. BROCK. We have so much faith in the younger men of our time that we venture to say that there are unknown men amongst the artists of both the old country and the colonies who, under the stimulus of such an occasion, are capable of and might have given us something better than the designs which have been produced. Nor is it only the artists of the Empire that have been wounded; the general public have resented the policy adopted, and the defective business ability of the committee is shown by the lack of funds for the completion of their scheme. The hole-and-corner fashion in which the designs submitted were exhibited was but the culmination of the bungling of the sub-committee, whose efforts would seem, from their actions, to be directed towards preventing the memorial from being "national."

Another great and almost national project, the

### NEW CATHEDRAL FOR LIVERPOOL,

has been brought to the front during the past year, and has been the occasion of controversies which even yet have not probably reached their full development. The committee in charge of the project have indicated their preference for English Gothic and for one particular phase of this as the style they desire. Thereat a storm of protest at once arose from those who are most keen in the present-day adoption of Renaissance as the vehicle of architectural expression. Catholicity of taste is a quality in which practitioners of architecture are notoriously deficient. Those who fight so vigorously for their own particular dialect should at least be ready to allow to others an enthusiasm equal to their own for another medium of expression. The committee have our respect for their courage, in indicating the predilection they possess apart from any question as to whether Gothic or Renaissance is the more proper treatment for an English cathedral in the twentieth century. Renaissance, indeed, for the moment happens to be the vogue for most of our architectural designs, but no argument that can be adduced in favour of Renaissance as against Gothic does not apply with equal force in favour of the "new art," or even Greek. If a design in English Renaissance garb by Mr. REGINALD BLOMFIELD is admissible, why not one by Mr. HARRISON TOWNSEND in the latest anti-historical mode, or one by a Glasgow follower of Greek THOMSON? The committee have, however, yielded to the expression of opinion from the anti-Goths and indicated their willingness to consider designs in other fashions.

Then, again, the committee have been adversely criticised for their method of selecting an architect. Certainly one must sympathise with Mr. EMERSON in being set aside after his victory in the bygone competition, but even then opinion was not unanimous as to the superiority of his design at all points, and architecture to-day does not stand where it then stood. The giants of church design in the seventies and eighties of the last century have now almost all passed away; younger men, as Messrs. CARÖE, CORLETTE, NICHOLSON, PRYNNE, SKIPWORTH, WARREN and others have with less opportunity given proof of their ability, and we think the committee are right in welcoming all and sundry to submit drawings to enable them to select good men for the final competition.

The fiercest controversy and the hardest battles which

the committee have to face are, however, connected with the question of the site, and a determined effort is now being made by a self-constituted body of dissentients from the committee's selection, calling themselves the "Liverpool Cathedral Petition Committee," to force the committee to abandon their own choice of St. James's Mount in favour of the Monument Place site. As we understand the case, the chief reason for the selection of the St. James's Mount site is the less cost of this as compared with the other, and we do not doubt that if the petition committee would guarantee to raise independently the extra cost of the Monument Place site, the cathedral committee would be only too pleased to adopt that location, even though it is, as we consider, legitimately open to question whether a central position in the midst of the noise and bustle of a great city is a suitable one for a cathedral, and whether a half-mile vista of the west front sufficiently compensates for the inability to see the cathedral on any other side except at very close quarters. Personally we prefer the site of Westminster Abbey to that of St. Paul's Cathedral. It is easy enough to raise opposition and to get up a "petition," but let the dissentients prove their sincerity by making their scheme financially possible, and thus save themselves from the suspicion that their real sentiment is unintentionally revealed in their own words, "Better no cathedral."

Whilst the members of the National Church are squabbling before they begin cathedral building, the adherents of the Church of Rome are working, and the

#### CATHEDRAL AT WESTMINSTER

has as regards its external fabric taken concrete form, and is rapidly approaching completion, so that we can begin to realise the ability of Mr. BENTLEY and the effect of his original and clever design. Here we have no straining after half-mile vistas, and although we may not all be agreed as to the precise value of some of Mr. BENTLEY's detail, we must recognise that his is work that will live, that it is virile, conscientious and thoughtful, and we doubt not that the interior when completed will once more teach us, what our compatriots who differ from us in form of worship have often before shown us, that a church is a place in which to worship rather than at which to gaze from outside—a lesson, by the way, of which English Churchmen at the present day, judging from the empty benches everywhere to be seen, need very forcible impressment.

Once again during the past year have architects been able to realise the

#### GOVERNMENTAL CONCEPTION OF ARCHITECTURE

in the steps that have been taken in consequence of the decease of the selected architects of the new offices in Whitehall and Parliament Street. Mr. WILLIAM YOUNG's son has been entrusted with the carrying out of his father's design, and though in this case there is no great objection to be raised, it is nevertheless thoroughly characteristic of English thought to assume the inevitable transference by heredity of the father's mantle to the son. In the case of Mr. BRYDON, on the other hand, there was no son in his office to step into the father's shoes, and in the condition in which Mr. BRYDON's design was left, it was of vital importance that the further execution of the work should be carried on by a man of equal ability and of like sympathy. In spite of all remonstrance by professional and amateur lovers of architecture, capable of realising what architecture is, and wherein lay the excellence of Mr. BRYDON's work, officialdom can see no further than the limited purview of its own ring-fence.

The scant respect which the official world shows for the opinion of architects is but a reflex of the lack of

#### PUBLIC APPRECIATION OF ARCHITECTURE

and of architects which is characteristic of the ordinary British citizen. Hence we were glad to see Mr. LEWIS SOLOMON's attempt to wake up the Royal Institute to its duty in the matter, even although the resolution he proposed was toned down to the appointment of a committee "to inquire into the status of the architectural profession, and to suggest remedies if needed." We trust this committee will make an earnest effort to grapple with the question—not to stifle and shelve it. One great evil is the

lack of appreciation of each other's work, and of tolerance for divergent opinion; another, the absence of self-assertion in architects as a body rather than as individuals. A greater regard for architects and their opinions on the part of the public would make for a better appreciation of architecture as an art, but can only follow an increased respect by architects for each other's opinions, and an adamant solidarity in adhesion and fidelity to *esprit de corps*. Particularly is this necessary in regard to competitions. Nothing is more discreditably to the profession than the jaundiced efforts of defeated competitors to throw discredit on a successful rival, which we unfortunately so frequently see.

The action of the architects of the Midland city in connection with the

#### BIRMINGHAM UNIVERSITY BUILDINGS

was in our opinion one of those regrettable exhibitions of deficient *esprit de corps* which do so much to belittle architects and architecture in public opinion. Messrs. ASTON WEBB & INGRESS BELL in open competition won the commission for the Law Courts, and in carrying out the work have given Birmingham one of its most beautiful buildings. In limited competition against able men they won the commission for the great educational establishment at Horsham for Christ's Hospital. They are carrying out another great scholastic institution in the Britannia Naval College. What wonder, then, that the authorities of the University of Birmingham should select these well-proved architects for their new buildings, and give them the commission without competition?

Yet this was made the occasion by the Birmingham Architectural Association for an attempt to oust Messrs. WEBB & BELL entirely, by the specious suggestion that the work should be thrown open to competition with Messrs. WEBB & BELL as assessors, chiefly on the ground that these gentlemen are not Birmingham architects. The clannishness of Birmingham people is well known, and to this the agitators appealed. There are able architects in Birmingham, but do they confine themselves to their own city? If they wish no outsiders in Birmingham, they should take no work outside Birmingham. Do they not do so? Who are the architects of the Royal Victoria Hospital at Belfast, for example? Let us hope this is the last exhibition of such petty parochialism that will be given by the Birmingham Architectural Association.

#### ACTIVITY IN THE BUILDING TRADE

has unquestionably during the past year been still further on the decline, in sympathy with the general contraction of the nation's trade and the increased price of money, which is one of the results of the uncompleted war in South Africa. This decrease of activity has not been an altogether unmixed evil; indeed, those contractors who were fortunate enough to secure large works at the beginning of the year must be inclined to regard it as a blessing, inasmuch as the unworthily low scale of production which, as most of us know, was becoming the rule with builders' workmen has been checked, and the bricklayer who would only lay his 200 bricks a day knows that there are plenty of men out of work who are ready to give something more like a fair day's work for a fair day's pay. The prices of material have also been on the down grade, so that builders who are now working on contracts secured twelve months or more ago must be making comfortable profits.

We are inclined to think from what we hear amongst architects in town and country that the bottom of the "slump" in building has fallen out, and although we are not anywhere approaching the boom of a few years back, still things are slightly better than they were. That they may continue to improve to the benefit of all our readers is our hearty wish for the New Year.

Throughout the country many large public buildings are in various stages of progress. The competition for

THE NEW BOROUGH ASYLUM, CARDIFF, has resulted in the selection of the plans of Messrs. OATLEY & SKINNER, whilst premiums of 100*l.* each were awarded to Messrs. GREENAWAY & NEWBURY, HOOLEY & SAUNDERS, LAW & ALLEN, WILLS & ANDERSON.

THE NEW MUNICIPAL BUILDINGS, CARDIFF, are now fairly on the road to realisation, the foundations put in and the walls proceeding.

THE VICTORIA AND ALBERT MUSEUM at South Kensington is completed as far as the foundations, and a second contract for building to the ground-floor level is now in course of fruition.

THE NEW MARKET HALL, LEEDS, is in course of construction from plans prepared by Messrs. LEEMING & LEEMING, and will cost about 100,000/.

The designs of Messrs. BRIGGS & WOLSTENHOLME and Messrs. F. B. HOBBS & ARNOLD THORNEY have been selected in the competition for

THE BLUECOAT HOSPITAL, LIVERPOOL, and will cost in carrying out something like 90,000/.

The competition for new

MUNICIPAL BUILDINGS, HEREFORD, was not quite satisfactory in its result, as although the assessor placed the designs of Messrs. MACINTOSH & NEWMAN first, those of Mr. H. F. FOWLER second, and those of Messrs. STANGER & STANGER third, the building committee of the Corporation selected the designs of Mr. H. A. CHEERS.

For the

POLICE COURTS, BRISTOL, the designs premiated were those of Mr. HENRY WILLIAMS, of Bristol, and Messrs. BUCKLAND & FARMER, of Birmingham (another case of Birmingham architects going outside their own limits).

The competition for the new

FIRE STATION AND POLICE COURTS, MANCHESTER, a building to cost 75,000/; resulted in the victory of Messrs. WOODHOUSE & WILLOUGHBY with Mr. JOHN LANGHAM, whose design was placed first, the second place being taken by Mr. GEORGE WATSON and the third by Messrs. MANGNALL & LITTLEWOODS.

Local jealousies and dissensions have prevented the

WORKHOUSE INFIRMARY FOR STOCKPORT at Stepping Hill proceeding smoothly, although the premiums in the competition were awarded to Messrs. GILES, GOUGH & TROLLOPE first, Mr. H. PERCY ADAMS second, and Mr. CHARLES W. HARDY third.

The past year has seen some successful exhibitions, amongst which must be placed first the

INTERNATIONAL EXHIBITION AT GLASGOW, which, with the true business instinct that might be expected from the Clydesmen, has been financially prosperous as well as enjoyable and instructive.

THE BUILDING TRADES EXHIBITION in London at the Agricultural Hall has also been held this year with conspicuous success. A new feature was an exhibition in a side hall arranged by the British Fire Prevention Committee, of fire-resisting construction and appliances.

THE PAN-AMERICAN EXPOSITION, BUFFALO, was not a financial success, and its failure was intensified by the dastardly murder of the late President MCKINLEY.

A subject of absorbing interest, not only to Londoners but to all Englishmen, has been the threatened

DANGER TO ST. PAUL'S CATHEDRAL, by the consummated burrowings for underground tube railways and the extreme probability of impending catastrophe from contemplated schemes. These projects for

UNDERGROUND TRACTION are not without their dangers. The "twopenny tube" has been proved to have caused damage, and the extension of this solution to the crucial problem of London traffic has rightly received the attention of a special joint committee of the House of Lords and House of Commons, which has, with no unnecessary promptitude, considered the various aspects of the whole question.

THE WIDENING OF PICCADILLY has for the present been determined by a compromise which can hardly be more than temporary, and the suggestion by Mr. H. L. FLORENCE, recently illustrated in our pages, for a parallel relief road through the Green Park has obvious advantages and is readily applicable.

The scheme for

UNDERGROUND TRAMWAYS at a slight depth only is one which in its adoption has great promises, and will, we have no doubt, be hereafter largely followed as a valuable assistance to the overcrowded thoroughfares of the Metropolis.

THE LIABILITY OF ARCHITECTS for inefficiency or negligence has repeatedly during the past year been heavily enforced by the courts, and may be regarded as a useful aid to the weeding out from the profession of the ignorant and incompetent charlatans who, in default of registration or some such safeguard, now need only a brass plate and impudence to foist themselves upon a gullible public, to the detriment of honest and well-trained practitioners.

On many other topics of interest to architects and architecture we might touch, but space forbids us to do more than record some of the losses, many of them heavy, that have been caused by the hand of death in a year that has seen the passing from amongst us of ARTHUR CATES, JAMES BROOKS, JOHN MCKEAN BRYDON, JOHN BURNET, HENRY YEOVILLE THOMASON, CHARLES JOHN INNOCENT, WILLIAM BASSETT SMITH, FREDERICK BOREHAM and CHARLES DORMAN.

### STEREOTOMY FOR STUDENTS.

THE annexed illustration shows some of the examples of stone-cutting lately produced by students of the classes in Geneva directed by Mr. Lawrence Harvey. The exercises are a continuation under more favourable auspices of those which were undertaken a few years ago in the classes of masonry in the City and Guilds of London Institute. For such subjects severity of style is not always desirable. The end in view should be the attainment of skill in the manipulation of form among elements which, when combined, will form a whole that is effective. The different parts, it will be observed, allow of the co-operation of students varying in competency, and who can derive satisfaction from their united endeavours. The subjects deserve consideration by the heads of technical schools in this country.

DEMOSTHENES.

EURIPIDES.

#### BUSTS AND THEIR IDENTIFICATION.

**P**ORTRAIT busts are so common, it is not generally admitted that the early history of the class of sculpture to which they belong is obscure and has formed the subject of much controversy. The origin of the word itself is not clear. "Bustum" with the Romans was a crematorium or a grave, and by a very usual process in language was afterwards applied to a dead body. "Sanctorum busta" was an ordinary expression to designate martyrs. Afterwards the word signified the trunk of the body without the head. As the Latin sources seem to fail, modern etymologists have turned towards others, and many now believe the word "bust" to be a derivative from some Northern language. It is allied to the German "Brust," which is the modern form of "borst," and was related to "bären," to heave. Bust, simple as it may sound, remains an etymological puzzle.

If considered in a practical way the bust seems to have marked a development of the primitive *hermæ*, which were originally only blocks of stone dedicated to deities. Although the Greeks had advanced in sculpture beyond all other nations, yet until a very late period they preserved with reverence those strange memorials. Afterwards the stone became a pedestal for a head that was rudely carved. In course of time the pedestals were lengthened and a channel was chiselled in them to suggest limbs. It would also appear that not only the Greeks but other nations placed heads on wooden frames which were covered with drapery, and in that way served as figures.

It is not, however, to be determined at what period among the Greeks the heads became representative rather than typical. The pretty story about a girl outlining the shadow cast on the wall by her lover's head would indicate that in an early period portraiture in the modern sense was understood. But it is now impossible to settle how far idealism competed with accurate representations of living beings. The beautiful profiles which are found on Greek coins may sometimes have been exact portraits either of a famous beauty, or of some man or woman of importance in the town. We shall afterwards refer to a case of the kind, viz. the sage *PITTACUS*. Sculptors who have had experience in portrait-work have not been able to determine the limits between realistic and ideal heads in Greek work. The difficulty is not confined to Greece. It was at one time believed that no true portraits were to be found in Egyptian painting or sculpture, but it was demonstrated plainly by *CHAMPOLLION* and later explorers that with them realism was respected, and that even defects were not ignored. Among the Greeks there are sufficient traditions to suggest that fidelity in portraiture was practised, and it is not irrational to presume that several of the heads which

seem to be expressions of the artists' ideas have been taken from nature. There can, however, be no general rule on the subject, for even now when the sun becomes the portraitist the results are often declared to be irreconizable.

Common sense must always make people sceptical about the authenticity of the likenesses of men like *HOMER* or *LYCURGUS*, who lived in a remote age, when the arts were not in a flourishing state. We cannot help imagining busts of that kind to be either derivations from busts of a ruder form, but which were exalted by tradition, or creations which the artists based upon the attributes assigned to the men by history. Types were respected by Greek sculptors, and it is possible the busts of their ancient poets, legislators and warriors were akin to examples of older date of which we have now no trace.

It was stated by *PLINY* that there was no true portrait of *HOMER* known to the generations which preceded his own. What passed for a portrait was considered by him to be no more than an expression of the imagination of sculptors. It has been said, "Ten famous towns contend for *HOMER* dead, through which the living *HOMER* begged his bread," and from the number of busts differing in character of which there are records, we may conclude that each of the towns justified its claim of being the birth-place of the poet by the possession of a portrait. It would be difficult to ascertain why the bust which appears on this page should have been accepted as coming nearer to one's own idea of the appearance of "blind *MELESIGENES*, thence *HOMER* called." The historic evidence is not irrefutable, but the qualities of the bust are favourable to a conviction of its genuineness. The eyes have not merely the vacancy seen in ancient busts and statues, but are suggestive of blindness. The head is surrounded by the band that belonged to gods and heroes. It is evidently a likeness of old age, and the furrows indicate sorrow as well as thought. But, at the same time, the noble expression is almost suggestive of a soul that, unlike *TITHONUS*'s, was endowed with perennial youth, and there is more than philosophic composure stamped on the face. *HOMER* was destined to be the great apostle of literature, and therefore of civilisation, for it is surprising that the old poems which "*PHŒBUS* challenged for his own," and pirates respected so much that they gave liberty to the captives who would recite them, are still supreme in all schools where literature is taught. No Italian, English, French or German poet holds the supremacy in his native country which *HOMER* still retains throughout Christendom, and from which there is no likelihood he will ever be deposed.

In the cases of the orator's and dramatist's busts seen alongside *HOMER*'s, there are grounds for believing that they were taken from nature. *EURIPIDES* is said to have

LYCURGUS.

ALEXANDER.

PITTACUS.

been born in Salamis in B.C. 480, and at that time Greek sculpture was opening its third and most glorious period, in which such artists as MYRON, CALLIMACHUS, POLYCLETUS, SCOPAS, PRAXITELES and PHIDIAS exercised creative powers. In the days of PAUSANIAS statues of EURIPIDES were to be seen in Athens, and as late as the fifth century they were found ornamenting Byzantium. All the busts and statues of the dramatist are so suggestive of physical vigour as to confirm the story that EURIPIDES was brought up by his father to be an athlete. He was the most muscular of poets, and refuted the theory that inspiration was only a characteristic of weaklings. It is terrible to think that when he retired from Athens, owing to the decline of his popularity among playgoers, he should be torn to pieces by the hounds of ARCHELAUS of Macedon. Assuming the bust to resemble him, EURIPIDES was a noble-looking man, but unluckily his mother sold vegetables, and that was enough to enable ARISTOPHANES to bring the most tragic of poets into ridicule.

There is also so much similarity between the bust reproduced and a statue of DEMOSTHENES, we have the satisfaction of believing we see something more than an imaginary work before us. When RICHARD COBDEN saw the Vatican *Demosthenes*, which is an upright figure, holding in the two hands a scroll, he, although no amateur in art, was convinced that the attitude must have been taken from life, and that the tension of the arms and hands was suggestive of the character of the speech the orator was delivering. The peculiar form of the mouth, and especially of the lower lip, seen in the bust and statue, has been judged by critics who profess to have a knowledge of anatomy as a sign of a man who laboured under an impediment in speaking, and who was only able to cure himself by incessant labour. It is in characteristics of that kind that nature is recalled to us, and the gloomy expression of the noble brow suggests the fate of the orator who, in his own person, became an epitome of Greek liberty, but was destined to fall through the ingratitude of those for whom he lived and laboured. In the Townley collection of the British Museum there is another bust of the orator, but it is wanting in the expression of that resolution which "shook the arsenal and fulmin'd over Greece," and would better serve for a CLEON or other spouting tanner.

ALEXANDER THE GREAT must have had many portraits taken of himself, for he was the patron of artists. It is, however, remarkable that not one of them which can be regarded as authentic is known to have come down to us. The head which is found on a coin is generally accepted as having claims to be as true a likeness as coins usually present. But some archæologists maintain that the same head is to be found on contemporary coins bearing a different

name. The bust which was discovered in 1779 near a country house of the PISO family, and which we engrave, was judged to be a valuable acquisition. But as the surface of the marble was greatly corroded and some parts were mutilated, it does not entirely agree with the descriptions of the son of PHILIP which the old historians have drawn. The nose especially is not of the aquiline form which was a characteristic of ALEXANDER, and as other parts have had to be restored the bust cannot be accepted as a faithful likeness. On the other hand, an inscription leaves no doubt that the bust had ALEXANDER for subject. The head is fine, but it has not the dramatic effect of the Vatican bust of the conqueror, which was prepared as if to suggest that there was a second sun god, and on that account holes were bored in the marble in order that gilt rays might be fitted into them. The head of the PISO bust is that of a mortal, but a great one, and it may well serve for a warrior who was able to conquer the world, who was a statesman as well as a soldier.

As a law-giver LYCURGUS was the superior of ALEXANDER, but as he lived about nine hundred years before the Christian era and in the least advanced of the Greek states, it was not to be expected that portraits which are more than an approximation to his appearance are to be found. The Spartans had no great love for sculpture, and the last man among them to care for such luxury was likely to be the author of the institutions which gave consistency to his country during several centuries. The individual counted for little in Sparta, and all that is recorded about LYCURGUS or any of the warrior chiefs was derived by later writers from tradition. On that account the bust of the legislator can only be looked upon as an exercise in sculpture by a Greek artist.

PITTACUS was another law-giver who lived somewhat nearer to our time, for he died B.C. 570. He was numbered among the seven wise men of Greece, but is not to be taken as entirely mythical. He was a native of Mitylene, in Lesbos, and appears to have been the bravest as well as the wisest among the islanders. His life was written by DIOGENES LAERTIUS, and several other Greek and Roman historians were fond of referring to him as an authority. The only grounds for maintaining that the bust is not entirely imaginative is its correspondence with the head on a coin of Mitylene.

The six busts of which engravings are given can be taken as exemplifying the degrees of certainty or uncertainty which are the measure of our knowledge of ancient art. Unless care is taken it is astonishing how short a period is needed in order to make the identification of the human being represented by a painter or sculptor an impossibility. At the present moment the so-called *Duchess*

of Devonshire gives rise to as many doubts as surround statues and busts which are ancient. It cannot be laid down with confidence whether it was painted entirely or partially by GAINSBOROUGH, and all means adopted for tracing the subject are without avail. Yet the picture was produced in the eighteenth century by an artist whose work was described by his contemporaries, and the lady represented must have been of some importance in order to have been dignified by so admirable a work. It is not therefore surprising that the portrait in the National Gallery by VANDYKE, long known as *Gevartius*, should now be catalogued as *Cornelius van der Geest*, that *Borgia and Macchiavelli* should be transformed into *Sebastiano del Piombo* and *Ippolito de' Medici*, and that some portraits in the same collection are officially marked as "supposed." The uncertainty becomes, of course, magnified when we have to deal with representations of Greek and Roman notabilities. In those cases we must be satisfied with evidence that is not deeply founded. Human nature, however, is not always displeased at deception, and there is more satisfaction in finding a bust labelled "Lycurgus" or "Pittacus" than "Bust of an Old Man." But what is the use of complaining about the difficulty of identifying portraits when so many large and important buildings exist without the least clue to the name of their designers?

### THE SUPPLY OF ELECTRICAL POWER OVER LARGE AREAS.

By F. J. WARDEN STEVENS, A.M.I.M.E., A.M.I.E.E.

THE question of the generation of electricity on a large scale, and its distribution over extensive areas, covering districts under the control of several local authorities, is one which is of the greatest importance. In the early part of the year 1898, a committee of Parliament was appointed to consider, amongst other matters, the following:—

"Whether powers should be given in any case for the supply of electrical energy over an area including districts of numerous local authorities, involving plant of exceptional dimensions and high voltage."

As a result of this consideration it was decided that powers may be granted where sufficient public advantage is shown, and further, that the conditions under which such undertakings are authorised may differ to some extent from those existing under the Electric Lighting Acts.

A scheme which brought forward the importance of the question was that proposed in 1899 by a company called the General Power Distribution Company. The scheme of this company was to erect enormous generating works at Worksop in Nottinghamshire, where coal slack could be obtained for the generation of motive power at a very low rate. Mains were intended to be laid to a distance of about 26 miles from the power works, but the company did not intend to supply in competition with local authorities, although they required to lay their trunk mains through the districts of such authorities. The company's proposal was to supply only large consumers, such as manufacturers guaranteeing a minimum demand, and if desired to supply local authorities also for them to distribute to private consumers.

A glance at a map will show that such an area as set out by this company covered the important towns of Nottingham, Sheffield and Derby amongst others. The company's efforts to obtain Parliamentary powers were unsuccessful owing to the considerable opposition of the local authorities, but this scheme may be said to have been the pioneer of others of a similar nature which have since been brought before Parliament, and which I will refer to later.

I now propose to briefly consider independently the question from the point of view of the different interests concerned, namely, the public, the local authorities, and the companies.

In the first place it should be mentioned that the areas decided upon for such projects are manufacturing districts, areas near coal-fields or thickly populated places. The general claims for these schemes amount to the following:—

Owing to the high and increasing price of land in large

towns, and to the high cost of labour due to the question of housing the working classes; and, further, owing to the difficulty of obtaining cheap coal, there is a strong tendency for manufacturers to transfer their works to districts where they can reduce such costs.

Cheap power is an absolute necessity for our manufacturing works in order to be successful in competition with other nations, and it is electrical power that is required. It has been proved that electricity is obtainable at a lower cost when generated in large works than when produced from small works. As these principles are now acknowledged, and as in certain districts a real demand has arisen, the question has been, not so much as to the necessity for a supply of electricity specially suited for power in manufacturing centres, but the question of how it is to be supplied. The areas decided upon are usually of such large extent that it becomes more economical to supply from one or two large generating works situated conveniently to a coal supply, rather than from a number of local works. The great disadvantage of small works under separate control undertaking the supply of power in considerable quantities to individual consumers, is that it entails a large capital outlay, and the loss of one or two consumers after the necessary plant has been provided would be damaging to the financial working.

The further, and perhaps rather more disputable, contentions may be here summarised:—

In order to efficiently supply, various districts cannot be omitted in a defined area to meet the views of individual local authorities. The public as a whole is benefited and the claims of vested interests must be to a great extent neglected, so powers are sought for the whole area, irrespective of civil divisions. It is difficult to distinguish between the use of electricity for different purposes, and it is required to supply manufacturers for any purpose, lighting or power, and on stated terms; but the power companies are, as a rule, willing to a condition being imposed that where a local authority is already supplying, or about to supply, the company will not supply a consumer requiring less than a certain number of units per annum. A supply in bulk is generally offered to the local authorities at low rates, which are claimed to be lower than the cost of generation at independent small works.

The local authorities have, therefore, the opportunity of avoiding the outlay for generating plant, and require to incur only an outlay on the distributing mains for the local supply to private consumers.

In this connection it must be remembered that, as regards small or outlying districts in general, the cost of independent generating plant is a heavy tax on the scheme, and often entirely prevents the adoption of electricity supply. Further, a local authority with limited borrowing powers, by obtaining electricity from a power company, is in a position to lay mains practically over the whole area and give a supply for the same capital outlay as that involved in erecting works and laying mains in restricted areas. There is thus no doubt that the power companies will enable electricity to be supplied in many suburban and other districts where a complete scheme could not be carried out because of limited borrowing powers, or where otherwise only a small portion of a district could be supplied.

When the supply is given also, the risk to the distributing undertakers is very much less. By having a certain margin between the purchase and selling prices there can be no loss on working, while the utmost risk is that of capital charges. With separate works the standing charges are so high that, if electricity is not taken up quite as rapidly as expected, there is often a considerable loss on working in the early years in addition to the capital charges.

Local authorities, in opposing such schemes, have brought forward the following claims:—(a) They have pre-emptive rights to supply electricity under the Electric Lighting Acts; (b) their approval is generally required before a provisional order is granted to a company; (c) they are responsible for the condition of the roads, and have a right to a voice whether they shall be broken up or not; and (d) they require a supply from separate works in their district on account of the employment of local labour and industries.

Having summed up in a preliminary manner the posi-

tion of the different interests concerned, it is necessary to consider in what way the interests of the local authorities are being protected without injury to the public.

It must be remembered that, under the Electric Lighting Acts, the opposition of a local authority must be reasonable, and if they will not themselves supply the requirements of the district their opposition is liable to be ignored. The question resolves itself, then, to the local authority carrying out the supply of electricity themselves or consenting to a company supplying.

Local authorities cannot reasonably raise objection to allowing trunk mains to pass through their districts to supply other unserved districts if an arrangement is arrived at as to the route of the mains, and especially if there is payment for wayleaves, also in view of the power granted to local authorities of undertaking the reinstatement of the road surface at the expense of the company. Conditions on such lines cannot be said to be unfair to or detrimental either to the local authority, the power company, or the public.

From the conditions under which a supply of electricity in bulk has been authorised the following may be stated:—

(a) It is understood that a supply in bulk can be given to any local authority or company authorised by Act of Parliament or provisional order to supply and distribute electricity, but not apparently in bulk to unauthorised undertakings established in the area.

(b) Electricity may be supplied for the purpose of providing power to any one, and also for lighting in such works where power is utilised. An objection might arise in this connection that a supply may be given for ordinary private purposes to the detriment of the "authorised distributors" providing a motor however small is in use. It is, however, provided that the "reasonable" consent of "authorised distributors" is necessary before a supply is commenced in their districts.

Having thus defined the position relating to this question, I will briefly describe some of the principal schemes authorised. These include, (1) Lancashire, (2) South Wales, (3) Durham, (4) North Metropolitan, (5) Midlands.

(1) This scheme is for supplying an area of 1,000 square miles in Lancashire, but does not include in the area Liverpool, Bootle, Manchester, Salford and Stockport. Generating works are intended to be erected at St. Helens, Wigan, Little Lever, and Trafford Park, adjoining the Manchester Ship Canal. Wayleaves only are given in the case of Bolton and for districts adjoining and receiving a supply from Manchester.

(2) The entire county of Glamorgan and a portion of Monmouth is the area covered by the South Wales scheme, which, again, is about 1,000 square miles in extent. The power works will be situated at Neath, Pontypool, and near Pontypridd.

(3) The area over which the county of Durham undertaking extends is 250 square miles, the generating works being situated at Gateshead and Durham, and additional works will be established at Harraton. Wayleaves only have been granted for the districts of Hebburn and Felling. The company controlling this scheme have, in addition to their Power Act, obtained provisional orders for the towns of Gateshead, Jarrow and Durham, in their area, to enable them to supply private lighting consumers and all classes of demand for electricity and, in addition, to work tramways.

(4) This scheme covers an area of about 325 square miles, including districts in the north of London, and extends from Hornsey, Walthamstow and Hendon, to St. Albans, Hertford and Ware. The power works are at Barnet and Hertford, additional works being proposed at Edmonton. Provisional orders have also been obtained in connection with this scheme for Barnet and Hertford.

(5) The scheme in the Midlands is authorised entirely by separate provisional orders for the greater part of the area, having as its centre Tipton, where the power works have been erected. Sub-stations are to be situated at Wednesbury, Rowley Regis, Brierley Hill and Bilston.

Other schemes of a similar nature already authorised or about to be brought before Parliament include the counties of Yorkshire, Nottinghamshire, and Derbyshire.

Such schemes it can readily be understood involve an

expenditure of several millions of money, and certainly open out a great field for the development of manufacturing industries. They must be looked upon as one of the greatest advances in the utilisation of electricity.

#### FACTORIES AND WORKSHOPS ACT.\*

ON Wednesday morning the Factory and Workshop Act, which was passed in the last session of Parliament, came into operation. We hope it will not be allowed to become a dead letter. The provisions of it have been inspired by the customary respect for property, which has hitherto caused legislation for factories to be of trivial advantage to workers. A little cleanliness and an attempt at ventilation will be almost all that is necessary to satisfy the law, whilst the demolition of some thousands of factories is needed throughout England in order to remove a peril to the State. It is not to be expected that men and women can be contented who for about one-half of their hours are confined in places which are more dangerous to their existence than any of the prisons of the country. Countless factories are of that class. Philanthropists have, however, supposed that the discontent of the working classes is caused by the defects of their dwellings. There is no doubt that unsanitary houses are factors in making people miserable. But many among them have to live as many hours in unhealthy factories as in unhealthy homes, yet while so many are ready to condemn the latter the condition of the factories never receives the attention from the public which is demanded. There would seem to be a belief that production to be profitable must be accomplished amidst dingy surroundings, and proprietors who have acted on an opposite theory have been considered to be amateurs rather than men of business.

Looking at the industrial history of the country, it might be thought that legislators believed human bodies were self-regulating machines, which could always accommodate themselves to external hazards. Adulteration was declared to be no more than an incident in competition, and the evils of factories were declared to be only a consequence of the employment of machines. When inquiries into the conditions of factory life began they were confined to efforts to discover to what extent the bodies of the workers, especially those of women and children, were not adapted to the long hours which the owners of factories insisted on. Regulations were made which could often be evaded. But in those days the shortcomings of the buildings where the operations were carried out were neglected, and it must be allowed that after sixty or seventy years the subject has not secured the attention which is necessary.

Let us take for example the Act which began its course on Wednesday. It deals with factories and workshops. What is a factory? There is, we believe, no general definition. We learn that a textile factory "means any premises wherein or within the close or curtilage of which steam, water or other mechanical power is used for preparing, manufacturing or finishing of cotton, wool, hair, &c." A non-textile factory means works, warehouses, furnaces, mills, foundries, &c., required for the making, altering, repairing, ornamenting, finishing, or adapting any article for sale. Shortly stated, "the expression 'factory' means textile factory and non-textile factory or either of those descriptions of factories." A workshop means any premises, room or place not being a factory used for the making of any article or part of any article, or the altering, repairing, ornamenting, finishing or adapting for sale of any article. There is nothing to indicate that any standard of construction is adopted, and it would be possible to have walls, roof, floors, doors and windows of an imperfect kind without incurring any penalty under the new Act. For what are the provisions?

According to the first section, a factory must be kept in a cleanly state; must be free from effluvia from any drain, water-closet, &c.; must not be so overcrowded while work is carried on as to be dangerous or injurious to the health of the persons employed therein; must be ventilated in such a manner as to render harmless, so far as is prac-

\* *The Law Relating to Factories and Workshops.* By William Bowstead, barrister-at-law. London: Sweet & Maxwell.

ticable, all the gases, vapours, dust or other impurities generated in the course of the manufacturing process or handicraft carried on therein that may be injurious to health. To secure those ends, all the inside walls and all the ceilings or tops of the rooms, all the passages and staircases (if they have not been painted with oil or varnished once at least in seven years) shall be limewashed once at least within every fourteen months. If they have been painted or varnished they are to be washed with hot water and soap once at least within every fourteen months. The medical officer of health or inspector of nuisances can order the limewashing whenever necessary. A factory or workshop will be considered overcrowded if there is less than 250 cubic feet of space and 400 during overtime for every person employed. The quantity of space may be reduced or diminished by order of the Secretary of State. Every room is to be kept at a reasonable temperature. Sufficient means of ventilation will have to be provided and maintained, and the standard is to be fixed by the Secretary of State. If a floor is likely to be damp to such an extent that the wet is capable of being removed by drainage, adequate means of draining must be provided. Sanitary conveniences must be also provided. Machinery is to be fenced. Steam-boilers are to be regularly examined. All factories erected after January 1, 1892, and all workshops erected after January 1, 1896, in which more than forty people are employed, must be provided with reasonable means of escape in case of fire. The doors of a factory or a workshop must not be locked or bolted, or fastened in such a manner that they cannot easily be opened from the inside. A court of summary jurisdiction will have the power to prohibit the use of an unhealthy factory or workshop.

In a general sense the foregoing lines express the spirit of the voluminous Act. There are special provisions for various trades and industries. It will be seen that the Act does not insist on any high standard of construction. So long as the provisions above mentioned are forthcoming the building will pass official scrutiny. Factory owners, if they are wise, will, for their own interests, do much more than the Act demands, but the Act can be obeyed on very economical terms.

The duty of enforcing the provisions of the Act will be entrusted to factory inspectors. The officials have under the Act manifold obligations, for they have to observe the Education Acts, the Truck Acts and other enactments. By what means they will be enabled to judge of the provisions for ventilation and other requirements is not stated. As a rule they have not had any training in construction, and we doubt if one of the inspectors now in office was ever examined about his knowledge of the scientific questions which are involved in the sections relating to buildings. As well as we can understand, they will be in a position analogous to MATTHEW ARNOLD'S, when the duty of examining needlework in girls' schools was thrust upon him. But the consequences of irregular or uneven stitches are trivial if compared with those which may arise from a want of skill in judging of the manner in which the provisions of the new Factory and Workshop Act are carried out. In proper hands the Act might be made a useful measure, but if it is not as stringently enforced as possible, it will be little more than a means for playing with sanitation, and will be one of those legislative shams of which we have too many already. It is to be hoped that architects and builders will not lend themselves to a superficial observance of the enactments, for where so little is asked for there should be no evasion.

The edition of the Act which has been brought out by Mr. BOWSTEAD contains much else besides the measure passed last year. The notes are valuable, and, what will be found useful, the enactments which have been repealed are given in full. There are also included the parts of other Acts which relate to factory works.

**M. Roger Ballu**, the son of the great architect, has been suspended from his duties of inspector of fine arts and professor at the National School of Decorative Arts, in consequence of a speech at a political meeting in which he attacked the French Government. French officials are now expected to sacrifice their rights as citizens to their offices.

## FLORENTINE INDUSTRIES.

IN the last report of the British Consul-General there is a description of the Ginori factory for the production of china, majolica and porcelain. It is situated at Doccia, about 8 kiloms. from Florence, on the right-hand side of the railway line to Prato. It was founded by the Marchese Carlo Ginori in 1735, that is, at about the same date as the works at Sèvres, and twenty-five years after the celebrated Meissen factory established by the Elector of Saxony. The progress made by the Ginori business may be traced in the increase in the number of hands employed. In 1848 there were 100, and in 1890 the number rose to 1,344. A diminution took place in 1899, their number being 1,141, which has remained up to the present unvaried. The factory occupies at Doccia a total area of 70,500 square metres, and is surrounded by the workmen's houses built by the Marchese Ginori for his men, numerous enough to constitute a village. It is fitted with various steam-engines with a total of 250 horse-power, thirteen circular kilns, eight small furnaces for artistic and ornamental majolica, two rectangular kilns for porcelain, four kilns for stoves, twenty-nine muffle furnaces for painted and gilt majolica, several kilns of various kinds and three gasholders for the lighting of the premises. The supply of the best class of machine tools of all descriptions is also abundant. The kilns are heated by British coal and by charcoal of pine, oak and elder wood.

The first material employed is chiefly china clay imported from the United Kingdom, and in a lesser degree Italian kaolin, pegmatites, felspars, quartzes and other silicious minerals and earths. The Italian clays have hitherto proved inferior to the French (Bollène and St. Yrieix), and especially to the British kaolins (Cornwall). In Sardinia numerous lodes of china clay are said to exist, but it appears that the clay obtained near the surface is lacking in purity. Should, however, the lodes be dug to some depth better results might be obtained.

The Doccia factory, in addition to table services of all kinds, from the plain and inexpensive to the most expensive ware of the highest artistic value, from common flower-pots to exquisitely modelled vases and bowls, manufactures porcelain plaques for the names of streets and numbers of houses, as well as enormous cylinders ("en biscuit") employed for corn grinding, stoves, filters, kitchen ranges, fireproof bricks, &c. With regard to the production of artistic work the Ginori factory has no need to fear any serious competition, but following its traditions, limits itself to the production of objects of real artistic value, disdaining bad imitations and the article known in the trade under the name of "camelote."

The Ginori factory amalgamated in October 1896 with the firm of Sigg. Richard, of Milan, under the name of the "Società Ceramica Richard-Ginori"; capital, 280,000*l.*; and works also the following factories:—Milan, stone porcelain, 800 operatives; Pisa, 300 operatives; Mondovì, 300 operatives; Vado, 50 operatives.

Sigg. Cantagalli & Sons' factory is greatly renowned for artistic majolica, especially for imitations from the antique, plaques for inscriptions, coloured and varnished tiles, Della Robbia work, &c. It employs seventy workmen, nine children and a woman.

Sigg. Salvini & Co. also manufacture artistic majolica, chiefly imitations from the antique. Their works are fitted with three kilns, and have a grinding mill for the preparation of the raw material.

Of late a co-operative company, called the Società dell'Arte della Ceramica, was formed in Florence by seven artists for the manufacture of imitations of the antique, especially of the pre-Raphaelite period.

Artistic furniture, which had unfortunately been a decaying art in Florence since the thirteenth century, was revived after the year 1840 by the works of some excellent artists, Ranieri Bardi and Barbetti at their head, who, abandoning the Empire style, brought wood carving to an admirable perfection. It is now, however, some years since the cheap commercial article has invaded the market to the detriment of real art. At present there are about 200 wood-carving studios in Florence, employing about 1,100 hands.

The Florentine mosaic (hard stones) industry, quite a specialty of Florence, once enjoying a world-wide renown, is now greatly affected by the competition of inferior mosaics of softer stones, as well as by fashion. The important Government works for hard stones, giving employment to twenty-one men, are, however, still in existence. It is calculated that this industry gives employment to 150 hands, including some children under fifteen years.

The working of ornamental stones, and especially of Carrara marble and serpentine (verde di Prato), holds a considerable place amongst the industries of the province. The working of marble and alabaster into statues and statuettes of an industrial type likewise occupies a considerable number of workmen, partly working at their masters' studios and partly at their own houses. The approximate number of workmen is 535. This industry, like mosaics, is almost exclusively supported by British and American demand.

## NOTES AND COMMENTS.

It would be interesting to know the private opinion of Mr. Justice RIDLEY about the evidence that was given in *BAILEY v. LONGTON*, which was tried before his lordship recently at Leeds. The plaintiff, Mr. WILSON BAILEY, sought to recover 171*l.* 3*s.* from Mr. LONGTON for services rendered in preparing plans and quantities and obtaining tenders for houses to be erected in Keighley. In 1887 Mr. BAILEY had acted as architect for the defendant, and when the latter intended to erect other houses in 1898 he gave the commission to the plaintiff, the fees being at the rate of 5 per cent. on the cost. The defendant altered his mind more than once about the planning, and at last decided that he would not go on with the buildings. The lowest tender amounted to 3,206*l.*, and he alleged that the plaintiff had estimated the cost at 2,256*l.* 10*s.* Plaintiff had received 87*l.* 1*s.* 11*d.*, and the defendant lodged in Court 5*l.* 4*s.* 6*d.* The two amounts make 92*l.* 6*s.* 5*d.*, and it will be asked how a gentleman who declared that it was his wish that the plaintiff should be paid fairly could arrive at that amount. That sum, however, was named by an architect, one of the defendant's witnesses, as reasonable remuneration. How such fees could be computed is by no means evident, for who knows whether there might not be a halfpenny more or less discovered in working out particulars? Another architect who appeared on behalf of the defendant was more generous, for he allowed an additional 13*s.* 7*d.*, which brought up the total to 93*l.* One of the plaintiff's witnesses said that by the Institute's schedule the fees would have amounted to over 300*l.*, and another architect declared he would have charged more than 200*l.* The Judge said that there was not any agreement by defendant as to the cost of the houses, and he gave judgment for the plaintiff for the full amount claimed. Cases of this kind have an effect which is not limited to the parties or witnesses in the action. They denote how easy it is when an architect is once on the spit to find willing hands to turn him. When an architect values another architect's services at about one half the amount the latter claims, what it may mean is that architects are to be found who are ready to work at very reduced rates, and are not afraid to announce the fact in public. Differences about the value of services naturally make people who intend to build rather dubious, and it is no wonder if they often ask borough surveyors to accept commissions for a lump sum, or run the risk of dispensing with architects and trusting themselves entirely to builders.

WE have reproduced from time to time several of the remarkable decorative designs by M. FRANÇOIS EHRMANN. From the circumstance that he studied architecture, and is competent to practise in that art, his paintings are peculiarly adapted for grandiose decoration in public buildings. For that reason he is often commissioned to design the most important tapestries which the Gobelins can produce, the *Sciences and Arts in Antiquity* being one, and which are intended to uphold the reputation of France in a class of work that is still unrivalled in other countries. We are therefore glad to learn that M. EHRMANN has been selected to produce an allegorical painting for the new Musée des Arts Décoratifs in the Pavillon de Marsan of the Louvre. It will be difficult to obtain compositions from other artists that will be of equal merit, and on that account we suppose M. REDON, the architect, has made arrangements to entrust the entire decoration of the grand hall to M. EHRMANN.

THE proposal of M. EDOUARD DETAILLE to have Paris adorned with signs has been received with general approval. As yet officialdom, which is omnipotent in the city, has only given a tacit concurrence. M. DETAILLE is of opinion that the competition among artists should be immediately opened, and that in October next all the examples produced should be exhibited in the Petit Palais. The jury, according to him, should consist of thirty members, together with the presidents of syndicates representing the various branches of industry and commerce. The members of the Institut of Fine Arts as well as all other artists desirous to assist, although not trying for the prizes, would be declared *hors concours*. All the signs that are awarded prizes would be at the disposition of the jury. M. DETAILLE is of opinion that they should be presented to shopkeepers who

are desirous to possess them, on condition that all recipients should guarantee an expenditure equal to the value of the sign on the artistic decoration of their shops or houses. He would, however, stipulate that in the rage for the imposition of new taxes which now prevails in Paris artistic signs should be always exempted. M. DETAILLE also insists that there is to be no imitation or adaptation of ancient signs. What is desired is that in the designs new ideas should prevail, and that they should be typical of Paris in the twentieth century, rather than reminiscent of Paris of the Musketeers. It may be mentioned that a new work entitled "*L'Enseigne*," by M. JOHN GRAND-CARTERET, with illustrations by M. GUSTAVE GERANNE, has been prepared, which no doubt will be used to suggest the ancient style which prevailed in the South of France.

It is not often a unique case comes before a Metropolitan Police Court relating to a railway company or a public authority. But the case heard by Mr. FRANCIS at Lambeth recently was certainly in that category. The London and North-Western Railway Company have a coal depôt at West Dulwich. Along Rosendale Road a sewer was constructed, and 459*l.* 5*s.* 9*d.* was claimed as the company's contribution. About 100*l.* of the amount was expended in enlarging an existing sewer, and the company objected to the payment of that sum. The argument was that the enlargement related to a sewer already vested in the Borough Council at Lambeth, and all expenses connected with it should be paid out of the borough rate, but to the rest of the claim there was no objection. On behalf of the Borough Council it was contended that the enlargement was demanded on account of the construction of the new sewer, and that the railway company, like other frontagers, should pay part of the cost. The magistrate considered that if the Borough Council's argument was acted on fully it would be unreasonable, unfair and oppressive, and he did not believe the Acts of Parliament were intended to bear such an interpretation. The summons was accordingly dismissed, and the Borough Council ordered to pay 10 guineas cost. It will be observed that nothing was said about any privilege which the railway company had acquired under public or private Acts, and which often affect cases under the London Building Act. Apparently frontagers on whom a similar claim was made would also be able to claim exemption on like grounds. The magistrate therefore declared his willingness to state a case should one be asked for, and as in suburban districts, not only in London but elsewhere, alterations of sewers may arise under similar circumstances, it would be well to have the judgment of a higher court. For at present it would appear as if sewers must be constructed of a size that would meet all possible circumstances, or be left when extensions take place of an area which will be equal to the new demands.

THE Germans are not negligent of the industrial resources which nature provides for them in their South-west African possessions. Near Karibib they have found a variety of marbles, and the KAISER has expressed admiration of the specimens sent to Berlin. As the colours range from snow-white to black, with others which are warmer in tone, it is expected the marbles will become valuable exports. Karibib is laid out with regular lines of streets, it has an excellent water supply, and the electric light is employed. There are extensive engine works near the terminus. For the railway lines sleepers are used of hollow pressed steel of about a quarter or three-eighths of an inch in thickness, forming a sufficiently strong support, especially in a sandy country. The rails are fixed, bolted and nutted on to these sleepers—eight sleepers to a pair of rails. In this manner they are conveyed, or rather pulled, by engines to the terminus of the line so far as it is laid, and as the earthworks are already done, the laying of the line is effected with rapidity. Bricks are not easily made, and various substitutes are introduced. One is granulated cork. The framing of the house is formed of grooved iron, which is filled with cakes of cork measuring 4 feet in length, 9 inches in width, and a thickness of 3 inches. The blocks are compressed with some adhesive matter, and although of cork and very light, look substantial. The houses constructed of the granulated cork are said to be cool in summer.

THE narrative of the various stages of the project for the erection of a statue to HONORE DE BALZAC would afford a subject for a pen that would resemble the great novelist's. It will be remembered that several years ago there were competitions for the model, which were without effect. Then the commission was given to M. RODIN, who as the most original sculptor of his time was believed to be alone capable of dealing satisfactorily with the subject. After a long delay he modelled a very remarkable head of BALZAC, but for the body he substituted a heap of wrappers, as if he wished to suggest that the author of the "Comédie Humaine" was accustomed to go about carrying all his blankets. The committee were amazed at the result and suggested modifications. But the sculptor was deaf to all appeals and remonstrances. Finally he threw up the commission. It was then offered to M. FALGUIERE, who, after various trials, contrived to satisfy the committee. Before the statue was completed he died. M. PAUL DUBOIS generously undertook the task. The statue is now ready, but a difficulty has arisen about the site. After many propositions it was arranged that the statue should be placed in the Place du Palais Royal. There was no peculiar fitness in the adoption of that spot, but it was at least an important open space. During the long negotiations over the statue and the site projects of another kind have been in progress. Under the site which was assigned to the statue there is now a railway. The statue consequently cannot be placed there. The Prefect of the Seine proposes no less than seven various sites. The committee have decided that under the circumstances, it will be best to accept a position in the Avenue Friedland, which is a continuation of the Boulevard Haussmann. The reason they assign is that it is not far from the house occupied by BALZAC after his marriage with the Polish lady, and the street which bears his name. But the place is distant from the centre of Paris, for it is near the Hôpital Beaujon; but it is better to have the statue set up anywhere than run the risk of accidents to it.

A FRENCH audience in a theatre is too well instructed to tolerate incorrect architecture, and as a consequence several architects obtain commissions for studies which can be used by the scene-painters. The latest instance of the kind is M. HECTOR D'ESPOUY. He won the Prix de Rome in 1884. Since his return from Rome he has often aided in designing architectural compositions which have gained applause for himself and those who executed them. His latest commission is for the decoration of the iron curtain in the new Théâtre-Français. The subject is to be *The Coronation of Molière*, and the background will form an architectural composition of exceptional importance. We hope one effect of it will be to restore harmony among the sociétaires, who, although like HAMLET's visitors, "the best actors in the world either for tragedy, comedy, history, pastoral, pastoral-comical, historical-pastoral, tragical-historical, tragical-comical, historical-pastoral, scene-indivisible or poem unlimited," are apt, like those in *Gil Blas*, to consider that they are infinitely superior to mere dramatists.

THERE is much evidence awaiting every visitor who was acquainted with Paris in the latter days of the Empire that the Haussmannising process is still producing its effects, and that the Quartier Latin is every year becoming more and more respectable in outward appearance. The students whose characteristics were described by HENRI MURGER would declare it to be an impossibility that close to the big fountain which stands at the entrance to the "Bou-mich" two houses should be erected in the Rue Danton which gained the first and second prizes in the competition for façades erected during 1900. The architects are MM. ARMAND and PERRONNE. But with the introduction of co-operative restaurants and co-operative lodging-houses, modernisation of buildings in the Quartier was inevitable. Four other houses have been premiated, viz., 21 rue Monsieur (M. GOY), 85 and 87 faubourg Saint-Martin (M. HERMANT), 170 rue de la Convention (M. LEGRUIL) and 81 avenue Malakoff (M. LE VOISVENEL).

It was once supposed that cities and towns grew through accidental circumstances. EMERSON says it is believed in America that cows are the best surveyors, for

they follow the routes which are easiest for locomotion. The Russians, from their peculiar manners and customs, might be expected to set out towns in a haphazard style. PETER THE GREAT, however, adopted system in laying out the present capital of Russia in a marsh, but it was necessary for at least 100,000 men to be sacrificed in the endeavour to cope with nature. Dalny, which is the present terminus of the Siberian Railway, in its planning suggests the spirit of PETER I. The place has been arranged in sections. There is one for Government buildings, which will comprise churches, schools, theatres and clubs. The steamship and railway offices are situated in the section. Another section will be mainly occupied with wholesale warehouses. Standing apart is a section where foreigners will reside. There is to be a Chinese city, but it will be separated by some distance from the European divisions. Streets are being formed on modern methods, there will also be parks and botanic gardens, and, if money and energy are sufficient, Dalny will present some of the appearances of the most modern European cities. The solution of a difficult problem in street construction deserves applause. Having a definite purpose, the city may not for a century, at least, be subjected to any change of character. If it should hereafter be found that alterations are necessary the Russian governor is not likely to hesitate to adapt the city to the requirements of unforeseen circumstances.

THE length of the cubit has given rise to a variety of measurements. From its importance as a standard there cannot be too much investigation on the subject. The origin of the name is not very clear, but it is believed to relate to bending, and it was therefore assumed that the cubit was the distance from the joint of the elbow to the end of the middle finger. That a human standard was adopted may be concluded from the expression in Deuteronomy, where the length of the bed of OG is said to be 9 cubits after the cubit of a man. There was apparently a second cubit, for the cubit mentioned in measuring the Temple is described as a cubit and a hand-breadth. Some commentators, however, consider that the Temple cubit was the old Hebrew one and not the Babylonian cubit with which the captives were familiar. The Greek and Roman cubit was thought to express the length from the elbow to the wrist or to the knuckle of the middle finger, and it has been calculated that it was equal to a foot and a half, or, more exactly, 1 foot 5'4744 inches, English measure, for the Roman, and 1 foot 6'2016 inches for the Greek cubit. The ancient Egyptians probably had two cubic measurements—the natural cubit was 17'71 inches, and the royal cubit 20'66 inches. The modern Greek cubit is 18 inches, and in Bengal the cubit is of the same length, or one half a guz or yard. In Morocco the cubit measures 21 inches. Mr. W. SHAW CALDECOTT now maintains "that the length of the cubit in common use amongst the Hebrews, and the one used in all their building operations, was one of an English foot and a fifth. The evidence on this behalf is derived from Babylonia, and was in July of this year laid before Professor FLINDERS PETRIE, as the most widely known of British metrologists. Professor PETRIE did not reject the evidence, but neither did he commit himself to an *ex cathedra* opinion upon it. On November 5 the documents relating to it were submitted to the members of the council of the Palestine Exploration Fund. By them the papers were submitted to Professor SAYCE for an opinion. A summary of the paper given to the committee was ordered to be printed. On receiving Professor SAYCE's report the Palestine committee relegated the question of the further examination of the evidence to the Society of Biblical Archaeologists, who, it is said, will summon a conference early in the new year to consider the whole question." If Mr. CALDECOTT is correct, it will be seen that all the calculations previously made are erroneous. The general opinion from the examples we have given is in favour of 18 inches being the length, although Bishop CUMBERLAND asserted the Hebrew cubit was 1 foot 9 inches. The size of many ancient buildings depends upon the length assumed for the cubit, and we hope the forthcoming conference will be successful in settling the problem.

WALL-PAINTING, OPERA HOUSE, PARIS.—THALIE—ERATO.

THE WESTERN BLOCK OF THE STRAND IMPROVEMENT.

WE publish a perspective drawing of this important block of buildings now in course of construction—important not only on account of its forming the new homes of the Gaiety Theatre, restaurant and hotel, and SHORT'S, LTD., but interesting because it marks the commencement of building operations on a large scale of what perhaps is one of the most comprehensive schemes of improvement promulgated in late years, and one worthy and fitting as a notable event at the commencement of the twentieth century.

Much thought, time, and no little anxiety has been caused in connection with the building forming the subject of our illustration, the Council, on the one hand, being most desirous of securing for this important western block a design worthy and fitting the unique situation, and which should to an extent govern the type to be followed in connection with the Strand frontage generally if not the curved street. After many conferences with the authorities and Mr. NORMAN SHAW, R.A. (who is largely responsible for the elevations as approved by the committee of the L.C.C.), a type was agreed upon which it was thought would satisfy all requirements, and at last this vexed question has been effectually disposed of to the satisfaction of all parties. The architects are warm in their appreciation of the great assistance afforded by Mr. NORMAN SHAW, R.A., in arriving at this happy termination to a difficult problem.

It will be remembered that in a former issue we published the drawing of the Gaiety Theatre, *Morning Post* offices and a part of the hotel as designed by Messrs. ERNEST RUNTZ & Co. and exhibited in the Royal Academy. The design has, of course, now been abandoned. It will be found in comparing that illustration with the one now published that the theatre block has been considerably heightened by the formation of a massive loggia and dome, thus making less perceptible the difference in height of the theatre and hotel.

Without doubt the present design will result in a building impressive by its massing, dignified in conception, and pure as to detail, at the same time suitable for the various commercial undertakings to be carried on, a really remarkable achievement when one realises the extremely varied purposes of the respective buildings.

We append a general description of the three interests involved in this western block as supplied us by the architects, and in doing so desire to call special attention to the 50 feet connecting or garden thoroughfare, which should prove a most pleasing and useful innovation to London street architecture.

The new Gaiety Theatre, as regards accommodation, will be about the same size as the present, but the approaches and exits being up to date and in accordance with the latest requirements of the London County Council, the building will necessarily cover a considerably larger area.

The principal parts of the house are approached through a circular colonnaded crush-room situated under the dome. From this crush-room, by a short flight of steps, the stalls corridor is reached, which extends the full width of the building, giving access to the stalls on either side. The dress circle is also approached through the crush-room, and over the latter is a foyer to be used in conjunction with the circle. On either side of this foyer are alcoves in which are refreshment bars. The upper circle entrance is in the Strand, with an exit into the curved street, and under the dome a large saloon is arranged. The gallery is treated in a similar manner, excepting that the entrance is in the curved street and the exit into the Strand. All details behind the proscenium wall have received every attention, and a lift is provided for the use of the artists.

It is needless to say that the ventilating, heating, lighting and fire appliances are all of the latest description, and when complete the New Gaiety should be one of the most comfortable houses in the country.

The restaurant and hotel premises, as shown in the illustration, form an imposing block of buildings, having frontages to the Strand curved street and the garden thoroughfare. The restaurant portion is situated in the

basement, ground and part of the first floor, and the upper part of the building is used for the purposes of a luxuriously arranged and equipped hotel.

The approach to the restaurant and hotel is from the central entrance in the Strand, which takes the form of a spacious vestibule, from which two broad corridors give access to the restaurant and hotel respectively.

The chief feature of the restaurant is the grand dining-room on the ground floor, 60 feet long by 39 feet broad and 30 feet high, with windows facing the garden thoroughfare on one side while on the opposite side are windows looking into a fernery. A gallery is arranged round this room at the first floor level, and a separate service room is provided to both the ground-floor and the gallery.

In the basement are placed two smaller dining-rooms, a smoking-lounge and the large billiard-room and the kitchens, while on the ground-floor the frontages to the Strand and the curved street are occupied by buffets, and in connection with the latter a large smoking-room is arranged on the first-floor.

In connection with the hotel is a spacious lounge on the first floor, from which the dining and smoking-rooms are approached, and a ladies' writing-room is placed on the second floor. Several of the rooms are arranged in suites of various sizes, comprising a sitting-room, bathroom and from one to three bedrooms.

It is proposed in carrying out the decorations of this hotel and restaurant to adopt a scheme of varied methods. Some of the rooms will follow the more general styles of ADAMS and LOUIS XV., but it is intended in the majority of cases to carry out a treatment of modern decoration, enabling the architects to infuse that amount of individuality into their work which is so promising a sign of the present day.

The premises occupied by SHORT'S, LTD., are absorbed in the general architectural treatment and do not show as a distinct section. They are situated at the corner of the Strand and garden thoroughfare, and comprise the ground and basement floors for the purpose of their business, the upper floors being designed to let out as offices.

MESSRS. ERNEST RUNTZ & Co. are the architects.

## HENRI IV. ORNAMENT FROM THE LOUVRE.

DURING many years Italian influence was exercised on the construction of the Louvre. It was believed that Fra Giocondo, the architect, was engaged on the buildings in the reign of Louis XII. Serlio also prepared plans for enlarging the buildings in the time of Francis I. It is possible that among the numerous Italians who were brought from Italy for the decoration of the palace at Fontainebleau some were engaged on the Louvre. Catherine de Medicis, the wife of Henri II., is believed to have largely patronised her countrymen. For a time she preferred the palace of Tourneelles, but after the death of Henri II. from a wound by Montgomery in a tournament she returned to the Louvre. Henri II., however, wished a part of the building to be a memorial of his affection for Diana of Poitiers rather than for his wife. The letters H. and D. combined may be discerned among the ornamentation which was executed during his reign. The ornament was of a very elaborate kind, and differed in character from what was seen in the older parts of the palace. But it evidently was adapted to the new ideas of art which were accepted in the Court.

When Henri IV. came to the throne he had to deal with an agitated Paris. After a few years he was able to restore calm to France, for the strife between Catholics and Huguenots was suspended. Then were recommenced the works at the Louvre, and he allowed his sculptors to continue a similar class of ornament. He had married another princess of the house of Medicis, and it is supposed that her approval was given to the carving. A great many sculptors were then employed, but those who were more immediately concerned in the architectural work shown in the illustrations were Pierre Biard, Boileau and Morel.

Critics who take a general view of the work executed under Henri II. and Henri IV. are not always able to distinguish between them. There is, however, an absence of the letter D. in the work of the later reign. It is also thought that the four upright lines which were introduced here and there were

supposed to serve instead of IV. In the bands which were intended to mask the joints of columns it will be seen a sword is introduced entwined with laurels, which is also believed to recall the bravery of Henri of Navarre. The balance symbolised the equity of the king, who treated old and new subjects alike. The cable might suggest at first sight the pleasing bonds in which the second Henri was held by Diana of Poitiers, but its applicability to Henri IV. must be derived from different reasons. The use of the fleur-de-lis in the capitals is also significant of Henri IV., who was descended from Louis IX through the heiress of the house of Bourbon, although he was king of Navarre. Whether he had a right to the fleur-de-lis which belonged to the Valois branch of the family is a question which is not worth discussing now. Any sign or token which would help to make Henri's seat firmer on

the throne would be adopted by him regardless of any objection of the heralds. The shells and the profusion of flowers have been taken to express a compliment to Marie de Medicis, and some other ornaments have been imagined to form the letter M.

If tested by severe rules the ornamentation is excessive in quantity and in variety. There was even a time when it was proposed to remove it because it recalled the Bourbon family. Percier and Fontaine, the architects, were, however, able to have the destruction delayed, and they coated the whole of the ornament with plaster in order that it might not offend the eyes of purists. Their prudence must now be applauded, for, with all its exuberance, the treatment is valuable as revealing an endeavour to escape from the coldness of faithful reproductions of Classic Orders. For use in terra-cotta a similar mode of dealing with columns would be applicable.

SCULPTURED COLUMN, &C., FROM THE LOUVRE

CARVED ORNAMENT FROM LOUVRE

## THE LATE SIR NOEL PATON.

THE *Dunfermline Press* has the following graphic article on the late painter:—

Dunfermline has lost one of its most distinguished natives in the death of Sir Noel Paton, which occurred with startling suddenness at his residence in George Square, Edinburgh, on the 26th ult.—the venerable artist being found dead in bed. Since Lady Paton's death in May of last year, Sir Noel did not possess so much vigour, and it was observed that after coming to town from the country in the autumn this year he did not appear to have been so much benefited by the change as his relations had hoped. Some time ago the doctor declared his heart to be in a very weak state, and he has been ill for about two months although not confined to his room. When the maid went into his room about five o'clock on Thursday morning he was found lying quite dead with a peaceful expression on his countenance. It had been his custom to read in the early morning in bed, and it looked as if he had been making preparations for this when he passed away. His death has created national regret. Into the humblest homes he had carried his refining influence, and the creations of his fancy in some form of reproduction are as familiar in the cottage as in the castle.

Sir Noel Paton was born at Wooser's Alley, Dunfermline, on December 13, 1821. There is little doubt that through his father, Joseph Neil Paton, Sir Noel acquired and inherited his artistic faculty. Through his mother his talent and character were enriched with the poetic fancy and spirituality of the Celt. Without the direct and clearly defined influence exercised upon him by his mother, his family story had been a pointless tale. Like Burns and Aytoun, he was his mother's child, drew from her his patriotism, the imagination which made the heroes of Scottish history and border minstrelsy live again, and the fancy which filled the dells and glens with elves and fairies. When in 1864-65 Sir Noel painted "Fact and Fancy"—his boy Diarmid and a group of fairies—he was only giving pictorial form to an incident of his own boyhood. He so believed in the supernatural that he used to go out on moonlight nights and peer through the trees in perfect faith—"I am sure the fairies will come to-night." Young Noel was the sublimated product of nearly a thousand years of Highland superstition. His mother was Catherine M'Diarmid, a daughter of Archibald M'Diarmid, the seventh in descent from a sixteenth-century namesake, chief of the ancient and once-powerful Siol Dhiarmid. Her mother was Amelia Robertson, who came through the Robertsons of Invervack and Drumachune from the house of Strowan. The Robertsons of Strowan trace their descent through the De Atholias to Malcolm Canmore.

Descent explains much in the painter's art. Superstition gives place in him to a prolific and always beautiful fancy, and the creative faculty finds exercise amongst themes suggested by Jacobite loyalty, and by the history, fiction and poetry of Scotland. The earliest of Sir Noel's recorded works was a water-colour drawing of the "Combat between Bothwell and Balfour," in "Old Mortality"; the second was an oil—"Annot Lyle Singing," from the "Legend of Montrose." To that quality of Sir Noel's genius were due the "Quarrel of Oberon and Titania," "Puck and Fairy," "Reconciliation of Oberon and Titania," "Meeting of Zephyr and Aurora," "Thomas the Rhymer and the Queen of Faerie," all painted between 1846 and 1851. All the Shakespearian pictures of Puck, Ariel and Caliban were due to the hereditary tendency to people the supernatural with the beautiful and the weird. "The Bluidie Tryste," "The Dowie Dens of Yarrow" and "Watching the Pass" were the fruits of youthful excursions into Border ballads in the company of both parents. From these it is a short stride to the Arthurian cycle, whence some of Sir Noel's finest works were inspired. These began in 1860 with "Lancelot of the Lake" and "Sir Galahad and the Angel," which were followed in 1865 by the "Death Barge of King Arthur"—a drawing in black and white, done for the Art Union of Glasgow. Other Arthurian subjects were dealt with in the interval, but in 1879 came two versions of "Sir Galahad and the Vision of the Holy Grail," and in 1889 the subject was reverted to.

For the religious side of Sir Noel's art it is necessary to turn more particularly to his father and early home. Sir Noel drew his first breath in an atmosphere saturated with art. His earliest recollections were of casts, engravings and his father's works of design. He drew, as a boy, upon any scrap of paper he could find; with a burnt stick he drew Biblical and Jacobite pictures upon the whitened hearthstone, at thirteen he began to model, at fourteen he had illustrated the Bible. Reduced to its elements the parental influence was evenly divided. If the mother was Highland, full of traditions and Jacobite enthusiasm, the father was a Lowland artist, educated in fine art and design, learned in ballad literature and an antiquarian. He was, moreover, a collector, and surrounded his children with all manner of weapons, armour, curios and relics. They grew up in a kind of artistic Mediævalism, and reality strengthened the

hold of the antique upon taste and imagination. Paton *père*, yet further, was a religious man, the son of a Unitarian, and himself successively a Methodist, a Quaker and a Swedenborgian. He was an earnest searcher for truth, a wanderer in quest of a creed, who abandoned churches without compunction when he found their beliefs unsound.

Locality vitalised every one of these varied elements. The house at Wooser's Alley stands near the edge of a ravine which Sir Noel painted as the scene of his "Queen Margaret and Malcolm Canmore." He pictured the royal lovers, after wandering up the glen from the palace, sitting in religious converse on mossy stones immediately below the site of his own early home. In Sir Noel's early life the ravine was in all likelihood less bare and prosaic than it now appears. Be that as it may, as a boy he could look from its verge down to the grey walls of the palace and the abbey, and the thoughts they stirred are easy to surmise. The abbey ruins are a memorial of English invaders and of Reformation iconoclasts. The palace was a seat of Government, and for five hundred years a more or less regular royal residence. Within the abbey Malcolm and his queen were buried, and there also King Robert Bruce rests in his shroud of lead. Thus the charm worked upon the boy-artist. Were these kings not his forefathers? Was the palace not his ancestral home? Was Scottish history not interwoven with that of his family? Are these, we ask, merely a boy's fancies, and as such not worthy of serious consideration? In similar fashion all the mother's stories and the father's art and religion might be swept aside, were it not that they reappeared as influences in life, character and art. His mother made him a poet, and we can read the fact in "Poems by a Painter" and "Spindrift." His father made him an artist, and taught him the beauty of graceful form; and we can read the results of the lesson not only in the work of one of the most accomplished draughtsmen of his day, but in his sculptured models.

His father also filled him with his own religious feeling, and, above all things else, set before him an ideal of Christ higher than that of the average Christian. Sir Noel was known mainly as a religious painter. It is both curious and suggestive of the unbroken continuity of his personal development that it is between fifty-three and fifty-four years since he painted "Ruth Gleaning," his first exhibited picture. It was followed within a year by "Rachel Weeping for her Children," "A Holy Family" and "The Spirit of Religion" (large cartoon). Then came at intervals "Christ bearing the Cross," "The Entombment," "Gethsemane," "Mors Janua Vitæ" (1865-66), "Faith and Reason" (1871), "The Man of Sorrows" (1875), "Christ, the Good Shepherd" (1876), "Thy Will be Done" (1878), "Lux in Tenebris" (1879), "In die Malo," and others of a remarkable gallery containing by far the most powerful and eloquent contributions to Christian art made in modern times. Their moral and religious influence, evinced in poetry, general literature and pulpit, has been so great as almost by comparison to belittle considerations of technique and purely artistic quality. Inspired with a message of the most profound gravity and deepest interest to humanity, Sir Noel delivered it in language at once lucid, attractive and poetic. He painted homilies and sermons, and what he had to say to his fellow-men he couched in terms most thrilling and melodious.

Sir Noel's early reading quickened his imagination, for the favourite literature of the family consisted of the Bible, Bunyan's "Pilgrim's Progress," Pope's "Homer," Blind Harry's "Wallace," Barbour's "Bruce," Macpherson's "Ossian," and Scott's "Border Minstrelsy." When about thirteen years of age he tried his hand at modelling, but he did not persevere with that branch of art, and devoted himself to sketching and to illustrating the books he read. When he had attained his eighteenth year a well-known manufacturer of hand-sewed embroidered muslin, from Paisley, who was struck with young Paton's original ability as a draughtsman, offered him a position at the head of the designing department of his factory. Young Paton accepted this post, in spite of the opposition raised by his father, who thought that the work would interfere with his son's artistic career. While giving much satisfaction to his employers, he devoted his leisure hours to the study of literature and art. In 1843 he went to London, but did not stay there long, taking very little advantage of the Royal Academy, to which he had been admitted a student. Indeed, he never formally studied anywhere, a remarkable fact considering the comprehensive knowledge his works show of form and drawing. One of the incidents of his residence in London was the formation of a lifelong friendship with Millais—then a full-blown student, though still quite a boy.

In 1845 Sir Noel made his first great success, when he sent a large and ambitious cartoon, "The Spirit of Religion, or the Battle of the Soul," to the Westminster Hall competition. For this he obtained one of the three premiums of 200*l.* awarded by the Commissioners, the other two going to Armistage and Tenniel. From this time forward his position in the

world of art was well assured. The cartoon, "The Spirit of Religion," was afterwards presented by Sir Noel to his native town, and it adorns the walls of our Council Chamber.

In 1847 Sir Noel sent to Westminster Hall "The Reconciliation of Oberon and Titania" and a colossal religious painting, "Christ Bearing the Cross," and for these two he was again awarded the prize of 300*l.* by the Fine Art Commissioners. In the same year the Royal Scottish Academy elected him an associate, and offered to purchase "The Reconciliation" for the permanent collection. There were two other competitors for it, the Society for the Promotion of the Fine Arts and the King of the Belgians, but though he could have got more money for it he generously allowed the Academy to have it, and, as is well known, it and "The Quarrel," purchased by the Fine Art Society for 700*l.*, are now two of the most popular pictures in the National Gallery of Scotland. In 1856 the distinguished artist exhibited at the Royal Academy a picture entitled "Home," representing a guardsman being welcomed back by his wife and mother after the Crimean war. A replica of this picture was executed for Her late Majesty Queen Victoria, who also had a special photograph taken for her of Sir Noel's "In Memoriam"—a picture designed to commemorate the heroism of the British ladies in India during the Mutiny of 1857. Sir Noel many years afterwards painted for Her late Majesty "Vigilate et Orate" (watch and pray), which is hung in the prayer-room at Osborne. The subject, painted with power and sympathy, and generally acknowledged to be one of the finest of a series, is the return of Christ from His agony in the garden of Gethsemane to find His three disciples asleep. Together his pictures form a gallery of Christian art, the like of which probably no artist in modern times has produced. The most of them have been engraved and have had a wide circulation, carrying the spiritual message they were designed to teach into the homes of English-speaking people in many lands.

Sir Noel was made an A.R.S.A. in the year 1847, and in 1850 he was elected a full member of the R.S.A. In 1866 he was appointed Her Majesty's limner for Scotland, and in the following year he was summoned by royal command to Windsor to receive the honour of knighthood. In 1876 the University of Edinburgh conferred on him the degree of LL.D.

Sir Noel Paton was a man of great variety of gifts. In 1859, in connection with the patriotic movement to erect a national monument to Sir William Wallace, he modelled a spirited and symbolical group of a lion with a broken chain overthrowing a crowned Typhon, which it was proposed to carry out in galvanised iron on a huge scale. It had been selected by the acting committee, but was put aside subsequently on some sentimental consideration for the architectural design which now stands on the Abbey Craig. In the art of sculpture also he produced in 1865 two charming works—one a group of sea nymphs, to which he gave the name of "Spindrift"—an attempt to personify the breaking wave, and the other a group in wax—"Un Premier Pas"; and it may be recalled that he had a graceful design for the Scottish national monument to Prince Albert, which was warmly approved by Her Majesty, but was set aside by the committee for the equestrian statue by the late Sir John Steell, now in Charlotte Square, Edinburgh.

Sir Noel's grandfather, David Paton, was originally a weaver, but afterwards a wood-turner. Subsequently he took up printing, and made his own woodcuts to illustrate the books and pamphlets of which he was the author. He was the author of several little books on the Old and the New Burgher Kirk of Dunfermline, a collection of songs, and the "History of Dunfermline, Gathered from Good Authority and Personal Knowledge and Hearsay." His "History of Dunfermline," which is in rhyme, was in 1813 put in type and printed off by his own hands, and is illustrated with cuts of the abbey and the town house. The only copy of the book known to be extant is in the Advocates' Library in Edinburgh, and it is almost impossible to get copies of the other works at any price. Some of the illustrations are extremely clear, and have the marks of the careful detail which formed a characteristic of the work of his distinguished descendant. Sir Noel's father was born in 1796, and, like his father, began life as a weaver. He did not much care for the handloom, and was ultimately apprenticed as a printer. He had inherited all the artistic instincts of his father, and in 1818 he left the printing and took up damask designing, producing in great variety patterns of marked excellence.

Sir Noel is survived by a family of ten sons and daughters. One of his sons is a captain in the Camerons, and has been in South Africa since the outbreak of the war, being wounded in one of the first engagements. Another son is in Bombay, but all the others are in this country. His brother, Waller Paton, was a popular water-colour painter. His sister, Mrs. D. O. Hill, the wife of a well-known artist, has done good work as a sculptor. Deceased had during his life lent a helping hand to many an artist whom he guided in the early part of their career. He was of a retiring disposition, and thus, except through his

work, never came much before the public. Had he so desired, he might have been President of the R.S.A., but he preferred to devote his energies to art pure and simple rather than the direction of the business side of it. In his house in Edinburgh he had a very rich collection of arms and armour, there being in all 650 pieces of great value. Sir Noel always dressed in the national costume, and with his strong knit, stalwart frame, white locks under a Scottish blue bonnet and Highland plaid over his shoulder he was a picturesque figure.

## LIVERPOOL CATHEDRAL.

AT a recent meeting of the Liverpool Rural Deanery the Ven. Archdeacon Madden delivered an address, in the course of which he said:—

The St. James's Mount site, which has been selected by the committee and approved by the public, is central, commanding and picturesque. It is within a few minutes' walk of the great public halls—the Philharmonic Hall, Hope Hall and Y.M.C.A. Hall. These halls were erected in central positions in order to be "get-at-able" by the people from North, South and East Liverpool, and from outside, and the new cathedral will therefore be as get-at-able as these halls. As regards the commercial centre of the city, St. James's Mount is quite as convenient for business men as Monument Place, and in the course of years it will be more convenient. The next fifty years will see vast changes in the heart of the city, and a cathedral on St. James's Mount will probably by that time be in the very centre of the commercial part of Liverpool. Already Duke Street, Hanover Street and Seel Street have ceased to be residential, and warehouses and factories are taking the place of dwelling-houses. The "city" is steadily creeping upwards towards the Mount. If proximity to the centre of business life is a thing to be desired, then the cathedral fifty years hence will be as much in the heart of the city as St. Peter's is to-day. The position is commanding. There it will spread forth its vast wings brooding over the city. It will be seen from afar lifting its magnificence above the crowded streets. It will stand forth a great spiritual beacon towering over England's chief seaport, "to give life and to save life." Sir James Picton thus describes the Mount:—"The situation is most commanding. On a Sunday morning in summer the view is extensive and beautiful." The proposed site is one of the largest "open spaces" in the centre of the city. The open space upon which St. George's Hall is situated, *i.e.* all the free-air space surrounding the hall, including St. John's Churchyard, Lime Street, &c. is 17 acres. St. James's Mount was most central, being only 500 yards from St. James's station, and as near Central station, Exchange station and the pier-head as was Monument Place. It was only 600 yards further from Lime Street than Monument Place was. The open space at Monument Place was only 8 acres in extent. The whole open space connected with St. James's Mount is 22 acres, *i.e.* from Sandon Terrace to Parliament Street, and from Hope Street to St. James's Road. You could place the largest building in Liverpool, St. George's Hall, on St. James's Mount and not cover one-half the ground. The position is picturesque. No one can have visited the Mount and viewed the landscape from its commanding heights without being struck with the wonderful panorama presented to his eye, "the expanse of the Mersey, the estuary of the Dee, Bidston Hill, the ocean and its majesty of calm or storm, and the Welsh mountains terminating the perspective." I have seen from the gardens on the Mount a glorious sunset, and realised as I looked upon the flashing sunlit heavens what the effect would be as the lights of even fell upon the spires and pinnacles of a great cathedral—bathing it in golden sunshine. Its vast proportions would be transfigured with the wondrous light, its windows would shimmer with purple and with gold, and the noble vane would stand forth a gigantic amethyst "mingled with fire." To those who see in the inception of this scheme the "Hand of God," it will not be amiss to point out a remarkable coincidence. On the very day the public meeting was held in the Town Hall and St. James's Mount was approved as the site of the cathedral, the first lesson at evening prayer was Ezra 1 and 3. There we read:—"Then rose up the Chief of the Fathers, with all them whose spirit God had stirred, to go up to build the House of the Lord"; and again, "They gave money also unto the masons and to the carpenters . . . and all the people shouted with a great shout when they praised the Lord because the foundation of the House of the Lord was laid." And the coincidence is all the more striking when we remember that the original name of St. James's Mount was the same as that on which the temple was built, namely, Mount Zion. The objection that the cathedral committee are robbing the poor of an "open space" demands consideration. The cathedral will be erected on the north portion of the Mount, and upon ground now covered by houses and private gardens. It will not encroach to any large extent

upon the portion used by the public. As a matter of fact, when the cathedral is built the whole space round about the structure will be open to the public. Adjacent to the Mount are two gardens which are now open to the public—the churchyards of St. Luke's and St. James's. Churchmen are as jealous as any other portion of the community of the "rights of the poor," and, as a rule, if they talk less about the "rights of the poor" they often do more for them than the talkers. One must speak with bated breath in the hearing of experts on the subject of style. I am quite sure if any genius can produce a great and magnificent twentieth-century cathedral the committee will not select an adaptation of a thirteenth or fourteenth-century Gothic cathedral. Let it be clearly understood—there are many of the committee whose minds are not at all made up as to "Gothic" being the only style for an English cathedral. The architects have a perfectly free hand—young and old. And this is as it ought to be. When it comes to the selection of the design and the architect, the committee will be assisted by professional advisers. The final decision, however, in all matters connected with the building of the cathedral—the style, the architect, the stone, will rest with the committee. This is only reasonable. They are trustees, the responsibility is theirs and they must act on it, and not delegate it to others, however skilled and learned in their profession. The committee are the jury responsible for an honest and true decision. The judge and the K.C.'s are legal experts, and the jury listen with respect to all they have to say, but the twelve men in the box must give the verdict. To them the final decision is left. It has been stated that to place the cathedral north and south would be "an outrage on English Church propriety." It is an outrage that has been committed again and again by every party in the Church if it be an outrage. Walcott in his book on "Church and Conventual Arrangements," says orientation "was never a law of the Church." Here in Liverpool we have several churches placed north and south. One erected recently—St. Agnes, Ullet Road—was built by the most Anglican of our architects, Pearson. There was land enough to have built this church east and west; it must therefore have been deliberately placed north and south. York Minster and Canterbury and Lichfield Cathedrals do not lie direct east, but bend towards the south. As far as I can learn from leading men of all parties in the Church, the question of "orientation" is of little or no importance. The general verdict was, If it is possible place it east and west; if it is not possible place it north and south. Do not spoil the beauty and proportions of your cathedral for the sake of a custom that is not a law of the Church.

### THE SAINTE CHAPELLE, PARIS.

ALTHOUGH the dedication of a separate and distinct ecclesiastical edifice for relics was unknown before the times of St. Louis, yet we do know, says Clutton, that in cathedral and other churches in France, as in the whole of Christendom, altars expressly dedicated to the honour of relics were universal. In the sanctuary of a church or a cathedral it was usual to place such altars behind the great altar, but elevated above it. It was thus at St. Denis, at Notre Dame of Paris, at Rheims, at Bourges, and at Westminster and at Salisbury. Notre Dame of Paris had six altars of relics. The first, which contained the chasse of St. Marcel, was placed immediately behind the high altar, and raised above it; the chasse, which contained the remains of the saint, was of silver gilt, and enriched with numberless jewels and precious stones. It was placed on a table plated with copper and supported by four large and lofty pillars of the same material. More elevated still was a very large cross, the crucifix of which was also of silver gilt. To the right of the chasse of St. Marcel was that of Notre Dame, which was placed on the altar to the Holy Trinity. This chasse was also of silver gilt, and contained numerous relics. The remaining chasses, one of which was of wood only, covered with very precious drapery of silk, and sometimes carried in procession round the church, were those of St. Lucian, of St. Cosmo and St. Damian, of Severin and of St. Gundulph. All those chasses severally had altars to them. The altar tomb of Edward the Confessor at Westminster is situated behind the place for the high altar. The chasse which contained the remains of the canonised king was, like that of St. Marcel at Paris, raised on a slab or table, supported by columns, which, instead of being of copper, are chiefly of Alexandrian mosaicwork. In front, or against the west end of the basement or tomb, was a small altar, and the chasse itself had a feretory or movable covering, which was raised whenever the remains of the saint were exhibited to the faithful. These two examples from the principal churches in Paris and in London will suffice to show the arrangement for altars of relics where there was space sufficient in the sanctuary to admit of their presence. When, however, from the abundance of relics the space in a church

would not admit of each chasse having its proper altar, a practice became general in the thirteenth century of erecting over one altar an estrade or receptacle to receive several chasses; and for the purpose of lowering on to the altar beneath any one of these chasses, on the feast of the saint whose relics it contained, a square hole was left in the under side of the estrade, large enough to admit the passage of the largest chasse it held, a cord being the medium which regulated its descent. This plan was adopted at the cathedral of Arras, at the church of St. Etienne du Mont at Paris, and in the Sainte Chapelle itself.

With a few exceptions the building of Pierre de Montereau, erected to contain these relics, did not vary in its plan and arrangement from chapels contemporaneously erected and attached to palaces and other large residences. The type chosen by Montereau was the same as that which was then being carried out in the erection of the chapel to the archiepiscopal chapel at Rheims. Thus the circumstance of St. Louis erecting an edifice expressly to receive relics did not develop any particular ecclesiastical arrangement in the plan of the building. The common type of the day seems to have been adhered to; one recognised by its lower as well as upper chapel, consisting of from three to four bays, vaulted in one space, without aisles, and terminated at the east with an apse of three or more sides. The exceptions before alluded to in the plan of the Sainte Chapelle from that of previous and contemporaneous edifices is the introduction of small oratories.

SAINTE CHAPELLE, PARIS.

They present themselves as small recesses, one placed on either side of the chapel in the bays next to which the apse commences. These were respectively used by the kings and queens of France. Such oratories are found in all buildings of subsequent erection called Saintes Chapelles, as indeed in very many other chapels differently dedicated. Fireplaces, and chimneys attached to them, were introduced into these oratories. We also find that these buildings contained a succession of chambers one placed above the other, the whole communicating with the chapel itself by means of a small staircase. The use of these chambers is doubtless obvious, but a reference to the original statute of foundation of the Sainte Chapelle at Paris, and made by St. Louis, will show us the exact origin of this arrangement, besides other and curious information connected with the use of the buildings themselves and the manner in which they were served.

In 1248 St. Louis appointed for the chapel in honour of God and the Holy Crown five principal or master

chaplains, priests, each of whom was to have appointed with him a priest or sub-chaplain and a deacon or sub-deacon, three churchwardens, also priests, and each with his deacon or sub-deacon; one of the master-chaplains to be president, to whom the others were to be obedient. To each of the five chaplains and to each of the three wardens, besides offerings and endowments belonging to the benefice, an annual salary, payable half-yearly on All Saints Day and the Ascension, of 25 livres (parisis) was to be made, the president to have 15 livres additional.

The architecture of the Sainte Chapelle at Paris is an episode in the history of the art of the first half of the thirteenth century. It is very difficult to understand how the cathedral of Chartres, the archiepiscopal chapel at Rheims, and the Sainte Chapelle in question can be buildings of the same epoch, or where to find the connecting link between the severe art of the two first-mentioned works and the vigorous outburst of a new inspiration which Montreuil's buildings display. It is true that his genius may have prematurely developed the nascent forms observable in them; but the changes in the treatment of the mouldings, and particularly of the foliage carving, is an effort beyond the genius of any one man. The French have not yet attempted to solve the enigma, and it is not improbable that the daily increasing attention of the architects of this country to the art of France may assist sooner or later in deciphering it.

Every feature in the Sainte Chapelle is so well known that it will be needless to allude further to them. This building became the type of numerous other chapels, the remains of which are scattered over France. And here it is that a fact, very worthy of attentive observation, presents itself.

It is known that in France buildings called Palais de Justice occur in other cities besides Paris. It is also known that the large provinces, particularly in the fourteenth and following centuries, were governed by princes of the house of Valois and by the chief nobility. Thus at Dijon and at Lille during this period the Dukes of Burgundy, when not in Flanders, resided and kept their courts, and had in both cities palaces of a similar character to that at Paris. To the palace at Dijon the dukes summoned the estates of Burgundy, which province they possessed by right of appanage. At Lille they assembled those of Artois and Franche Comté, by virtue of the authority which had become vested in them as successors to the inheritance of the Counts of Flanders. The Duke de Berri also in this century possessed the county of Berri by right of appanage, whilst he governed Auvergne, Languedoc and Poitiers by commission from the king. Thus at Bourges and at Riom this prince built entirely new palaces, and at Toulouse and Poitiers enlarged others which had belonged to the former counts of those provinces.

Many other examples might be given to prove the general existence of such buildings in the great provinces of France during the fifteenth century. Thus at Aix there was a similar palace which had belonged to the Dukes of Anjou in right of their title of Counts of Provence, and at Rennes and at Nancy there were two others, belonging respectively to the Duke of Brittany and the Duke of Lorraine.

Besides being residences, these buildings were also the seats of government of the respective provinces, and in them the same functions were performed as were performed by the kings of France in the Palais de Justice at Paris, and in this similarity of name and application the chapels attached to them formed no exception. Each one was called Sainte Chapelle, after its Paris antitype, and for the reason already assigned they one and all contained and were dedicated in honour of holy relics.

These provincial Saintes Chapelles had usually an upper and lower chapel, partook exactly of the same plan, had oratories, one on either side, and apartments for the accommodation of the keepers of the chapel. In the oratory of that at Riom are fireplaces and chimneys. The Museum at Bourges contains a curious model of the now destroyed example attached to the palace in that city. On it is shown a flèche, such as we now see on the chapel at Paris.

In the internal arrangements of these buildings, that at Paris furnishes us with an exact arrangement for the altars and its estrade and circular staircases; the latter of these are parts of the original work.

From the description which has come down to us of the fittings of the Bourges chapel, we find, commencing from the west end, the two first bays formed the avantchoir, which was separated from the body of the chapel by a screen, probably of wood, since the doors of it, which are still preserved in the cathedral, are of that material. On either side of these doors and against the screen there stood an altar.

The next two bays of the chapel formed the choir, and ranged on the north and south sides of it were some beautiful wooden stalls. The tomb of the Duke de Berri, erected to him by his nephew, Charles VII., was placed in the centre of the choir, and protected by a grille of iron. The two tribunes or

oratories of the Duke and Duchess of Berri occupied the fifth bay on either side of the chapel, and somewhere in this part were placed the sedilia, which are now in one of the churches of the town.

Under the keystone of the vaulting of the apse stood the high altar, having a dossel or retable decorated with a picture. A small circular wooden staircase, about 4 feet 6 inches in diameter, with fourteen steps, is said to have stood behind this altar. This may have been the staircase to the estrade, or receptacle for one or more chasses containing the holy relics, as in the Sainte Chapelle at Paris. Under the east window of the apse was placed another altar, called Autel de Notre Dame la Blanche, on which stood a statue of Our Lady in white marble.

On either side of the altar were life-size statues of the Duke de Berri and of his wife, kneeling, with a prie-dieu to each of them. These statues were coloured and gilded, and are now in the lady chapel of the cathedral.

### ULSTER SOCIETY OF ARCHITECTS.

THE annual general meeting of the Ulster Society was held in Belfast under the presidency of Sir Thomas Drew, P.R.H.A.

Mr. W. J. Gilliland read the report, in which it was stated:—You will be pleased to know that the Society continues to prosper, as indicated by the considerable increase in the number of its membership. But signs of progress are not limited to mere increase of membership. The representative character of your Society is becoming more and more recognised, and its influence is beginning slowly to make itself felt. The representatives of the Society elected by the Corporation of Belfast on its technical instruction committee have succeeded in obtaining the appointment of an art subcommittee. It is hoped that great benefit to this department may result therefrom. Your Council have had the following subjects under its consideration:—Conditions of contract, builders acting as architects, revision of by-laws of local authorities, formation of prize fund and scheme for self-improvement of the junior members of the Society. With reference to the latter subject, it is intended to call a meeting not only of the members, but also of all their architectural friends at present outside the Society, as soon as it is possible, to frame a scheme for the purpose of indicating to the latter class the advantages of membership, and inducing in all a more enthusiastic interest in architectural study. The Belfast City Corporation, with a desire to improve the street architecture of the city, propose to include in an omnibus Bill which they intend to promote in the coming session of Parliament, a clause to regulate the "elevations of buildings." By a hastily-drawn and ill-considered clause they propose to cut the Gordian knot of a difficult problem by making the city surveyor the universal architectural censor for the city. Your Council have protested in the strongest way against this intolerable tyranny, and they will persist in their opposition, in which they expect the support of every member of the Society, until this objectionable proposal is withdrawn. A very substantial section of the Corporation, that which understands the subject best, is with us, and we have no doubt that we shall bring others to see that far from producing a desired and desirable improvement, the result of giving a city surveyor such powers would be most unsatisfactory and indeed unworkable.

The following officers were elected for 1902:—President, Sir Thomas Drew, R.H.A.; vice-president, Mr. W. J. Gilliland; honorary secretary, Mr. N. Fitzsimons; honorary assistant secretary, Mr. W. B. Fennell; honorary treasurer, Mr. Vincent Craig; council, Messrs. T. J. McDonnell, M. A. Robinson, F. H. Tulloch, W. J. Fennell and Henry Seaver.

The first annual dinner in connection with the Society was afterwards held. Sir Thomas Drew presided.

After the loyal toasts were honoured, Mr. W. J. Gilliland proposed "The President." Their thanks were due to him more particularly for the great interest, the friendly interest, he had taken in the success of their Society in the North. Without his support, enthusiastic support, and warm sympathy they never could have attained to the position they had done in the organisation of that Society in such a short period of time.

Sir Thomas Drew, in reply, said he could assure them there were very few things in life which were more pleasant to him than to find himself sitting in the position which he did that night in the town in which he was born and educated, and for which he had never lost his friendly feeling. Neither had he lost a friend of his early days except through death. Indeed, he always felt young when he was in Belfast. He had a great desire to see the profession with which he was connected in a better position in his native town, and he felt proud that the time had come when at last an organisation of local architects was an accomplished fact. Already

they found themselves face to face with questions of very great gravity to their profession, as well as to the public of Belfast, and he had no doubt when in time they came to be better recognised their organisation would be an exceedingly useful one, working in harmony with the municipality. In Belfast there was a question which affected them. A Bill had been promoted in Parliament which would in some points affect the practice of architects in this city, and there had been put into his hands that night for the first time the draft which was proposed. Among other things it stated:—"The surveyor may disapprove of such elevations on the ground that they were in his opinion objectionable, or that in any respect they are not in conformity with the requirements or provisions of the existing local acts or by-laws of the Corporation." That was certainly a most extraordinary clause, and, he feared, was drafted under a total misapprehension and mistake. The draughtsman of such a clause could not possibly have conceived what the ultimate result would be, and how it would affect architects. In the first place, could he have thought what a blow it was to the liberty of the free subject in this free kingdom? Municipal laws as regarded buildings were no novelty. Parliament had been hammering away at them for fifty years, and after many amendments and new Acts municipal legislation as to buildings was in a pretty concrete state. The City of London had a system which, with all its faults, was as nearly perfect as could be. The Local Government Board of England had issued model by-laws, which had been adopted by even the smallest urban authorities in the smallest towns, while the great municipalities of England had their legislation and their by-laws pretty well now in smooth working order. He ventured to say in no part of the King's dominions could such a clause as that proposed by the Belfast Corporation be found. He doubted if they would be granted by the Legislature if proposed. Those things which were really objectionable and offensive in property were regulated by the ordinary legislation in towns, and the precedents he had quoted were quite sufficient to meet them. The general powers given to municipalities as to frontage lines and the widening of streets were sufficient, and worked very smoothly. Then again, if such a preposterous clause as that proposed were adopted, who was the surveyor that he should be censor of architecture any more than of morals? What were his qualifications for the position? He was not an architect, as a rule. He (Sir Thomas) should also be very sorry indeed to see a censor of architecture appointed, although he might be a distinguished architect. They had all ideas of their own as to how things should be done. They should remember how that kind of thing was met in London under the Metropolitan Buildings Acts. There was a court of arbitration, consisting of three professional men, and their decision was the rule for the County Council. On mere questions of taste and architecture there should be no censor. Such a thing was foreign to the whole spirit of the British trader and at variance with the free spirit of the country. If such a thing were imposed it would be to the detriment of the architectural progress of the country. He hoped there would be enough good sense on the part of the Corporation of Belfast not to insist upon the proposed clause, and that a pen would be drawn through it before it became a public and burning question. It would be more creditable to the common sense of this city if that clause was drawn simply on the lines of other municipalities, and then there would be no more heard about it. If it, however, should be presented to Parliament, he was sure the architects of the city would take steps to oppose it. It would be their duty to do so, and he could promise that in their opposition they would have the assistance of the Royal Institute of British Architects and of the allied societies throughout the kingdom. He sincerely trusted the by-laws of his native city would be model by-laws, and that the architects and Corporation would work in harmony together. In conclusion, Sir Thomas thanked the members for having elected him president for another year.

Sir Otto Jaffé, in responding to "Our Guests," said that with regard to Sir Thomas Drew's remarks, he could assure the members that the law committee of the Corporation was only too pleased to see a deputation of their Society the other day. The committee attempted to alter certain clauses, and he believed that, to a certain extent, those clauses were an improvement upon the original draft. It would not be proper for him to disclose what happened in committee, but he might say that he took the liberty of expressing certain views about those clauses, particularly about that one referring to the elevation of buildings. He himself could not see how any professional man could be asked to give the height of adjoining buildings. The clause, however, had been retained in the Bill for the present. How long it would remain there would be a matter for discussion. As a result of the meeting of the Corporation the Bill had advanced one stage, but the clauses could be all altered yet. The members of the deputation that then appeared before the Council would remember that the Lord Mayor said:—"Gentlemen, if these clauses don't please

you, or are not in accordance with what you consider right, send us in a sketch of the clauses you would like." If they would be so good as to formulate at the earliest moment clauses as they would like to have them passed, and send them to the town clerk, he was sure Sir Samuel Black would be very happy to discuss the nature of them. That certain clauses might appear drastic they could understand was only natural. Architects argued that these clauses, as they had been put forward, were not in accordance with the custom, but somebody must break through the custom. If they could show the Corporation that the attempt to break through the custom was not good, he was sure the Council would be only too glad to meet their views. He would try to convey to his fellow-members of the Corporation the remarks which Sir Thomas Drew had so well made. The President had taken exception to their form of appeal. Well, they thought it was the very best form that the appeal should be to the Recorder, but if the system in operation in London was good enough for that city, he did not see why it should not be equally good for Belfast. The Corporation had nothing but the interests of the city at heart, and whatever was best would doubtless be done.

## INCRUSTATION OF STONE AT ST. PAUL'S.

A LATE number of the Proceedings of the Chemical Society contains the following paper by Mr. E. G. Clayton, F.I.C., "On an Incrustation from the Stone Gallery of St. Paul's Cathedral."

Around what is known as the Stone Gallery, at the base of the dome of St. Paul's Cathedral, is a balustrade of Portland stone, surmounted by a heavy coping-stone of the same material. Much of the surface of the stone is greatly "weathered," and is coated by a stratum of a grey or black substance, which in some places (especially on the underside of the coping-stone) attains a thickness of three-quarters of an inch. This material, which is brittle and detachable with a knife, has a very rough and irregular surface, is stalagmitic in character, and though differing in colour, in other respects resembles very closely some boiler deposits. It can easily be reduced to a fine grey powder, which, under the microscope, shows no morphological features indicating the presence of fungoid or similar matter.

Some of this incrustation has been analysed, with the following results:—

In 100 parts by weight :	
Water, lost at 100° . . . . .	2'06
" " 150° . . . . .	22'48
Organic matter (carbon) . . . . .	1'10
Lime . . . . .	26'44
Magnesia . . . . .	0'27
Ferrous oxide . . . . .	1'31
Silica, sand, &c. . . . .	10'39
(Including combined silicic acid, SiO <sub>2</sub> , 2'33)	
Sulphuric acid (combined) . . . . .	34'93
Phosphoric acid " . . . . .	1'02
Carbonic " . . . . .	none
Chlorine . . . . .	trace
100'00	

Bases and radicles being combined the composition is apparently as follows:—

Water (100°) . . . . .	2'06
" (150°) . . . . .	22'48
Carbon (soot) . . . . .	1'10
Calcium sulphate . . . . .	59'38
" phosphate . . . . .	2'22
" silicate . . . . .	1'63
Magnesium silicate . . . . .	0'67
Iron silicate . . . . .	2'40
Sand and uncombined silica . . . . .	8'06
100'00	

Evidently, therefore, the substance is composed chiefly of calcium sulphate, hydrated, together with some siliceous matter. Calcium carbonate, which might have been expected to be present, is not one of the constituents. What then is the origin of the incrustation? In the immediate vicinity there is no obvious source of gypsum or plaster. It cannot have been blown upwards from the bare leaden roof of the cathedral or floor of the gallery. The stones of the balustrade are cemented, of course, with mortar. Still less likely is it that so much calcium sulphate has found its way from the neighbouring thoroughfares. The sand and soot may, to a great extent, be thus derived, and perhaps a small proportion of the calcium sulphate represents coal-ash transported by wind. But after a careful consideration of all the circumstances, and especially the characteristic appearance of the incrustation, it is suggested that the presence of the main component is principally due to two centuries'

solvent and weathering action of rain, charged with sulphurous and sulphuric acids derived from the gases and smoke of innumerable surrounding chimneys. The action exerted by rain beating heavily against the stone in that exposed situation must be very considerable. The deposit of calcium sulphate, left by the water dripping and running from the underside of the coping-stone, has become gradually thicker, just as is the case with stalagmite and calcareous tufa, to which the external features of the incrustation give it a curiously close resemblance. That the weathering influence of rain has been potent no one examining the surface of the Portland stone can have a moment's doubt.

### ROYAL ENGINEERS AND BARRACK WORKS.

AN anonymous pamphlet has just appeared on "Military Engineering Reform," in which are reviewed the old complaints against the system under which Royal Engineers thrive throughout Great Britain, India and the Colonies. Hitherto it was found that the majority of sufferers were civilian architects and engineers who were either neglected in the erection of public works or were only employed in subordinate positions. In India especially Royal Engineers have obtained a monopoly of the principal appointments. As the complaints were supposed to be inspired by personal disappointment they did not receive the attention they deserved. The writer of the latest pamphlet is an Army official, and he professes to write as an army reformer for the benefit of the public. He demonstrates the inefficiency of the Royal Engineers in the present war in South Africa. It seems incredible, although it is a repetition of what occurred in France thirty years ago, that a better map of South Africa than any possessed by our Intelligence Department was produced by a German military attaché. The main cause of the defects is said to be the peculiar mode of training in the corps, which "is based upon the assumption that engineer officers are Admirable Crichtons. The result is that the system merely develops actors, who endeavour to play their part in the masks which the War Office orders them to wear. It is impossible for the young cadet to grasp a tinge of this knowledge, which is theoretical throughout. He is instructed chiefly by lectures and from books, and obtains literally no actual experience of his subjects, which are the most practical of the practical." During the two years' special studies only five months are devoted to construction, and then a subaltern is supposed to be competent to deal with fortifications, field works, telegraphs, ballooning, submarine mining, roads and bridges, railways, demolitions, electricity, surveying, pontoons, photography and the whole range of civil engineering, architecture, building construction, materials, &c. As the history of South Kensington reveals, they were not afraid to control art in various forms. The pamphlet mainly deals with military inefficiency, but the following cases relating to the meddling of the Royal Engineer Corps with building demand public attention:—

Permanent buildings are not constructed during war, which in these days of destructive weapons is necessarily of short duration, and troops are either protected by canvas or temporarily housed in rough huts that can be put up by any labourer. Moreover, an army is always on the move, and the construction of lasting habitations is unnecessary, so that even if an R.E. officer learns building and architecture to the masthead during peace, they will not be of the slightest use to him in the field. Indeed, fiddling about barracks only keeps him from his legitimate business, and he has a great outlet for his energies in fortifications, field works, telegraphs, ballooning, roads and bridges, and demolitions alone, not to speak of drill, tactics, musketry, manoeuvres, routine, &c.

The barrack department originally was wholly civil, but after the battle of Waterloo the Duke of Wellington caused it to be handed over to the military engineers in 1822, solely to prevent their disbandment after the Peninsular Wars. The actual technical work, however, was still done by civilians, and has been so performed down to the present day. The simple reason is that the engineer has had no proper education for building construction and architecture, and it is impossible to obtain the requisite knowledge and experience at Chatham. As a matter of fact, our barracks, and even our fortifications, are really designed and carried out by professional architects and civil engineers, conveniently styled "surveyors" and "draughtsmen," who are civilians, and, therefore, remain in the background. The builders are likewise civilian contractors, and not sappers. Indeed, the whole object of the system is to hide the workers and blind the eyes of the public. The R.E.'s merely perform administrative functions and "boss" others. Other army officers are thus only brought into contact with the figureheads, and never dream of the true state of affairs. It is this control by amateurs which has led to so much public waste, in which the civil architects have no voice whatever. The dual elements create endless friction, for the civilian feels himself degraded in order that the military officer

over him may be proportionately glorified. And the British taxpayer has not only to pay for these superfluous officers, but also for the squandering caused by their incompetence. The Royal Engineer is thus neither a soldier nor an architect, nor yet an engineer, and the régime could not be worse. Most of the younger officers hate barracks, and would gladly confine themselves to fighting, in which they can earn distinction and rapid promotion, but their fossilised elders persist in keeping up the ancient fictions. Some of the more honest-minded R.E. officers have raised their voices for reform in articles in the *United Service Magazine* and other journals, but they have been as one crying in the wilderness. The civilian surveyors, too, have again and again shown up the utter rottenness of the service in the professional press, but all to no purpose. General Sir Andrew Clarke, R.E., warned his fraternity years ago that their time would come to be adversely criticised, but even he was ignored.

Barrack scandals could be quoted wholesale, but we will confine ourselves to the most grave one, that of the Royal Barracks, Dublin. It was decided in 1891 to improve these barracks, and 60,000*l.* were allotted for the purpose. Two contractors were asked to tender for contracts involving the expenditure of 30,000*l.* each in six months. One of them declined to guarantee such an expenditure in the limited time with no drawings or quantities to know what to do; the other agreed to do so, and was given the whole contract as a measurement one, based on the War Department schedule of prices. Work was commenced without plans, estimates, or even a general description of what was to be done. This groping in the dark led to a state of "utter chaos"—to use the words of Lord Wolseley, then commanding the Forces in Ireland. Engineer officers were put in charge of the operations who had no particular experience of building, and these were constantly coming and going owing to hasty military calls. For example, one officer from another station was suddenly ordered to take over the work, and before he had been in Dublin six months he was hurriedly sent abroad because of "the exigencies of the public service." He had in the meantime given verbal instructions to the contractor to make an opening in a brick wall for a doorway. His successor caused it to be closed up and then afterwards opened again. His successor in turn converted the doorway into a window, and we can vouch for the fact that at least one such doorway was opened and closed five different times under various officers. All these were verbal orders, given in military fashion as if the contractor were a soldier being drilled on parade, and statements were seldom put down on paper. The result was that the builder had everything his own sweet way, and could rake up imaginary work which could not be disputed because the officers who gave the instructions had in the meantime been transferred to other places, as our military system does not permit them to remain long in one command. Had civilian architects been in charge they would have been there to see the job through from start to finish. In another case new floors were laid down at a cost of nearly 5,000*l.*, and then the building containing them was swept away altogether on sanitary grounds. Sham ventilating pipes to drains were fixed, which led to nowhere, but stopped at ground level. The very civilians who were told off to measure up and price the work were being perpetually changed, to make them conform to the beautiful jack-in-the-box ideas of the Royal Engineers.

Matters reached a climax in the autumn of 1893, when the contractor sent in his final claim of 160,000*l.*—just 100,000*l.* over the original estimate. The Treasury protested against the excessive expenditure, and a surveyor was sent over from the War Office to inquire into matters. After a laborious investigation, this gentleman gave it as his opinion that at least 45,000*l.* worth of work might have been contested on the recorded measurements and billing alone, and that probably the total overcharge was 100,000*l.* The builder declined to alter his claims, laughed at the Royal Engineers and threatened to take the case into the Law Courts. The Inspector-General of Fortifications, seeing that such a course would mean the exposure and damnation of his corps, recalled this official, and then sent over the chief secretary to treat generally with the claimant. But the latter would only waive his legal expenses, and so the huge bill was paid in full on July 4, 1895, to save the reputation of the Royal Engineers. We have, therefore, the startling fact that the interests of the State were utterly sacrificed to those of a rotten corps.

The Clarence Barracks, Portsmouth, of the latest construction and completed in the same year (1895), with accommodation for over 700 men, sergeants' mess, recreation establishment, stores and offices, cost 50,000*l.* The reconstruction (merely) of the Royal Barracks, Dublin, accommodating 1,000 men, cost 175,000*l.*; *pari passu*, if new, they should have cost 70,000*l.*; then where has the difference gone—100,000*l.* odd?

The finale is worse when the pigheadedness at the start is known, for Messrs. Guinness, whose Dublin brewery is just opposite the royal barracks on the other side of the Liffey,

made a handsome offer to the War Office at the outset for the purchase of these old barracks. They intended to utilise them for an extension of their brewery works, and to connect the two establishments by means of an iron bridge across the river. But the War Office refused, and left the royal tinkers to create the greatest building scandal of the nineteenth century.

When Mr. Rogers Field, M.I.C.E., the eminent civil engineer, made his report on the sanitary condition of these barracks in 1889, he discovered on examining the water-mains that a very large amount of preventable waste of water was taking place from the various fittings. This had been going on for ten years, and the money loss alone in that period represented 8,000/. Precisely the same thing occurred in Barbadoes, and was similarly put right about 1893 by the civilian surveyor at that station, the annual saving to the War Department being 600/. Why was this waste not discovered and put right by the Royal Engineers?

The Imtarfu Barracks at Malta presented so impressive an example of the capacity of the local R.E. officers (who altered the designs made by their civil architects) that the War Office on receipt of photographs of the buildings characterised them in an official rebuff as "unworthy even of a barbarous nation."

The expense of the staff for supervision of army works amounts on an average to 20 per cent. of the sums spent, yet in civil life an architect only charges 5 per cent., and a quantity surveyor 1½ per cent., or 6½ per cent. in all.

Many more barrack scandals could be cited, but enough has been said to show the taxpayer how his money is squandered through the endless incompetence of our military engineers.

### SURVEYORS AND RECORDERS AS ARCHITECTURAL CENSORS.

WE referred last week to the Bill of the Belfast Corporation by which powers are sought to compel architects to submit drawings showing the height, character and design of every building proposed to be erected in that city. The surveyor was to be empowered to disapprove of the elevations if he considered them objectionable, and any person aggrieved by the decision could appeal to the Recorder of Belfast. The Ulster Society of Architects have protested against the clauses, and in support of their opposition the following opinion of counsel has been obtained, which is worthy of attention in other places where a similar innovation may be contemplated:—

I have most carefully considered the clauses with reference to the designs and elevations of new buildings in Belfast, which constitute Part V. of the proposed new Bill, with a view to adopting the suggestion as reported of the Lord Mayor, that the Ulster Society of Architects should lay before the Council alternative clauses if the same was capable of being carried out.

I note that his lordship stated any proposed alterations in these clauses would be carefully considered by the Council.

In my opinion it would be impossible to frame any alternative clauses such as could or ought to be formulated, or even sanctioned, by the Ulster Society of Architects or by anyone interested in the advancement of architecture, and especially by all companies or traders desirous of spending money in Belfast either on the improvement of their old or the erection of new buildings within the city of Belfast. If it were merely in form that these clauses were objectionable, then alternative ones might be substituted; but the object of Part V., and the principles on which it rests, are inherently faulty and unprecedented in legislation. The passing therefore into law of Part V. as it now stands, or of any modification of it having a like object, should be most strenuously opposed before the Council, and if unsuccessful there, the opposition should be continued in Parliament.

The object of the proposed clauses is presumably to obtain uniformity of architecture in the city of Belfast, and that object is sought to be obtained by establishing an autocratic censorship in matters of artistic taste, on which the most divergent and fanciful ideas, from the nature of things, must always exist among a body of self-constituted censors.

Such a censorship could not but be injurious and intolerable to the profession of architects by killing all attempt at original architectural design in Belfast, and must of necessity interfere with the immemorial rights of private property and individual enterprise, and the spirit of independence to which Belfast owes her present proud position, and to which the greatness of the British Empire may be fairly traced.

Part V. of this Bill is manifestly intended to be supplemental to the vast quantity of private Bill legislation relating to Belfast, and is intended to give the Council powers of an entirely different nature to those heretofore enjoyed by them or by any other British urban authority, and so far as I know the only foreign precedent is to be found in the unconditional and autocratic powers exercised by Baron Haussmann under the Empire.

A close examination of all previous legislation on these

matters will show that every Act of Parliament bearing on them has been founded on the two following cardinal principles:—The first being that in all cases concerning sanitation and the prevention of injury to person or property the interests of the majority should be considered paramount, and the powers given the executive authority, including that of making by-laws, should, subject to certain defined restrictions, be practically absolute. The second principle is that in all cases where legislation was with regard to matters of municipal commercial convenience, the powers are only given on strict commercial lines and full provision made for the due compensation of the individual.

In Dublin and the surrounding townships such matters are regulated by almost identical codes of by-laws framed with regard to their several private acts and the Public Health Act. In no instance are the powers given at variance with, or do they go beyond the two principles I have mentioned.

Several years ago the Corporation of Dublin endeavoured to assert that their code gave them power to demand elevation designs, but the existence of that power having been directly challenged, the Corporation, after due consideration, came to the conclusion that their position was untenable, and abandoned their demand. Though a very considerable number of years have passed, no attempt has been made to revive this contention, nor have the Corporation or townships sought for legislative powers to enforce such a requirement. Here I may mention that the only interference with the height of buildings permitted is on the ground of sanitation, and Belfast already possesses that power under the 62nd section of the Belfast Act of 1878.

I think it is also of importance to mention that the Corporation of Dublin, as private owners and lessors, have powers somewhat similar to those sought for by the County Council of Belfast conveyed to them under the provisions of the old Wide Street Commission Leases. These restrictive clauses the Corporation, in the interests of the city, have long since waived as regards these leases, as tending to hinder individual enterprise and to prevent street architecture being kept up to date, but no such assertion of powers over the freeholders and leaseholders under other owners as that now sought by the Belfast Council has ever been dreamt of.

A very great object lesson is also to be learned from the example of London so very lately as 1894, when the entire question of the proper and satisfactory construction of buildings and streets over the vast area of Greater London was most carefully considered by some of the most eminent men in the kingdom representing every possible interest. The outcome was that carefully drawn and elaborate Act, 57 & 58 Vict. c. 213, an Act containing 218 sections and elaborate schedules, dealing with every case deemed possible; yet London, notwithstanding its great Parliamentary power, did not seek to obtain any powers not strictly in accord with the principles which I have already stated had governed all prior legislation.

It is very well worthy of note by the Ulster Society of Architects the respect shown to the profession of architects by that great city and by Parliament, inasmuch as although the power to make by-laws is strictly limited to certain objects, yet any draft by-law must be sent to the two great architectural bodies in England, the Royal Institute of British Architects and the Institute of Surveyors, at least two months before confirmation can be applied for; and the profession is further recognised as an authority on these matters, inasmuch as at least two of the three members of the Appellate Tribunal must belong to the profession, while the Council itself requires even the subordinate district surveyors to receive certificates of competency from the Royal Institute.

To sum up, I am of opinion that these clauses are objectionable in principle on the following reasons:—

1. As interfering with the private rights of property and enterprise on a quite novel and insufficient ground.
2. As tending to check all original design as regards buildings in Belfast, thus hindering the development of native talent and ultimately placing the architects of Belfast in a very disadvantageous position.
3. As being absolutely without precedent in these countries.
4. As confiscating the right of private property without any sufficient justification.
5. As introducing a novel and disturbing principle into this class of legislation.
6. As departing from the course adopted by both London and Dublin after most mature consideration.

The method in which the object of the Belfast Council is sought to be attained is also objectionable, inasmuch as the obstructive power now proposed to be given to the Council is much too wide, and would depend on various individuals' private idiosyncrasies, not on any recognised canons of art, and would possibly be influenced by personal, political or trade jealousy.

The Appellate Tribunal is also open to cavil, considering that they are not questions of interpretations of law, of fact, or even of public expediency which are to come before the

learned recorders, but mere questions of artistic taste, in which any judge would be indeed slow to reverse the decision of a professional expert in a matter of mere individual taste.

ARTHUR WM. MURRAY.

### TESSERÆ.

Frederick Nash and Joseph Nash.

FREDERICK NASH was born on March 28, 1782, at Lambeth. He was placed with an architectural draughtsman named Moreton, who gave him a thorough grounding in perspective; he soon after entered the schools of the Academy, and when about the age of nineteen exhibited a view of "Westminster Abbey." In Britton and Brayley's work, "The Beauties of England and Wales," may be found some twenty prints after drawings by F. Nash, bearing dates of publication from 1801 to 1809. In 1808 he was an exhibitor with the Associated Artists, and in 1809 a member of that society, contributing in these two years eight drawings. They included two interiors of "Westminster Abbey," the "West Front of St. Paul's," a large drawing of the "Choir of Canterbury Cathedral" and several ruins in Wales and the North of England. In 1810 he became instead a contributor to the old Society, exhibiting his five drawings as an associate. In 1811, having become a member, he sent twenty-two, followed by nine in 1812. His chief exhibited works were views of Paris and Versailles. Amongst his published works are "Illustrations of London," "Westminster Abbey and its Monuments," "The History of Oxford" and "Views of Paris and its Environs." Nash's practice was to make three drawings of his subject, coloured on the spot, with effects of early morning, midday and evening respectively. These he continued from day to day to the point of finish he deemed necessary. He died on December 5, 1856, at Brighton at the age of seventy-four. Joseph Nash was the son of a clergyman of the Church of England, the Rev. Okey Nash, who kept the Manor House School, Croydon. He was born at Great Marlow in 1808, and educated at his father's school, where he showed his bent by covering his lesson books with sketches. In 1829 he became a pupil of Augustus Pugin, and was one of the group of young men who went with him to Paris to make drawings for his "Paris and its Environs" (two vols. 4to, 1830). He began in this early part of his career to draw upon stone, his first lithographic work being also done in conjunction with Pugin, whose "Views illustrative of Gothic Architecture," 1830, are lithographed by J. Nash from sketches taken under Pugin's direction. He also published in four large volumes "Old English Mansions," wherein are rescued from oblivion so many of those magnificent examples of decorative invention which prove the age of the Tudors and the first Stuarts to have been the most fertile in architectural fancy this island has ever known. It was chiefly, however, as a painter of genre that he made his first independent efforts to obtain distinction as an artist. He was elected Associate of the Water-Colour Society in 1834 and a full member in 1842. He died at Hereford Road, Bayswater, in December 1878.

### The Origin of Mezzotint.

Prince Rupert, in his retirement at Brussels, after the catastrophe of his uncle, on going out early one morning, observed the sentinel at some distance from his post very busy doing something to his piece. The prince asked what he was about. He replied, the dew had fallen in the night, had made his fusil rusty, and that he was scraping and cleaning it. The prince, looking at it, was struck with something like a figure eaten into the barrel, with innumerable little holes closed together, like friezed work on gold or silver, part of which the fellow had scraped away. One knows what a mere good officer would have said on such an accident; if a fashionable officer, he might have damned the poor fellow, and given him a shilling; but the "génie fécond en expériences" from so trifling an accident conceived mezzotint. The prince concluded that some contrivance might be found to cover a brass plate with such a grained ground of fine pressed holes which would undoubtedly give an impression all black, and that by scraping away proper parts the smooth superficies would leave the rest of the paper white. Communicating his idea to Wallerant Vaillant, a painter whom he maintained, they made several experiments, and at last invented a steel roller, cut with tools to make teeth like a file or rasp, with projecting points, which effectually produced the black grounds; those being scraped away and diminished at pleasure, left the gradations of light. The surprise occasioned by the novelty of the invention, by its softness and union of parts, cannot better be expressed than in the words of Evelyn, whose abilities deserved the compliment paid to him by the prince, of being one of the first to whom this secret or mystery, as they held it, was imparted, and who was so dazzled with the honour of the confidence or with the curiosity of the new art that after encouraging the world

to expect the communication he checked his bounty and determined not to prostitute the arcanum, but to disclose it only to the elect. Here is his description:—"It would appear a paradox to discourse to you of a graving without a graver, burin, point or aqua fortis, and yet this is performed without the assistance of either; that what gives our most perite and dexterous artists the greatest trouble and is longest finishing (for such are the hatches and deepest shadows in plates) should be here the least considerable and the most expeditious; that, on the contrary, the lights should in this be the most laborious and yet performed with the greatest facility; that what appears to be effected with so little curiosity should yet so accurately resemble what is generally esteemed the very greatest, viz. that a print should emulate even the best of drawings, chiaroscuro or (as the Italians term it) pieces of the mezzotinto, so as nothing either of Hugo da Carpi or any of those other masters who pursued his attempts, and whose works we have already celebrated, have exceeded or indeed approached, especially for that of portraits, figures, tender landscapes and history, &c., to which it seems most appropriate and applicable."

### The First English Collector.

Thomas Howard, Earl of Arundel, is sufficiently known in his public character by that admirable portrait drawn of him by Lord Clarendon. Living much within himself, but in all the state of the ancient nobility, his chief amusement was his collection, the very ruins of which are ornaments now to several principal cabinets. He was the first who professedly began to collect in this country, and led the way to Prince Henry, King Charles and the Duke of Buckingham. "I cannot," says Peacham, "but with much reverence mention the every way right honourable Thomas Howard, Lord High Marshal of England, as great for his noble patronage of arts, and ancient learning as for his high birth and place; to whose liberal charges and magnificence this angle of the world owes the first sight of Greek and Roman statues, with whose admired presence he began to honour the gardens and galleries of Arundel House about 1614, and hath ever since continued to transplant Old Greece into England." The earl was not a mere selfish virtuoso; he was bountiful to men of talents, retaining some in his service, and liberal to all. He was one of the first who discovered the genius of Inigo Jones, and was himself, says Lilly, the first who "brought over the new way of building with brick in the city, greatly to the safety of the city and preservation of the wood of this nation." On his embassy to Vienna he found Hollar at Prague and brought him over, where the latter engraved a great number of plates from pictures, drawings and curiosities in the Arundelian collection. There is a set of small prints by Hollar, views of Albury, the earl's seat in Surrey. "Lord Arundel thought," says Evelyn, "that one who could not design a little would never make an honest man." A foolish observation enough, and which, if he had not left better proofs, would give one as little opinion of the judgment of the speaker as it does of that of the relator. The earl seems to have had in his service another painter, one Harrison, now only known to us by a chronologic diary, in which he records particulars relating to Old Parr, whom Lord Arundel had a curiosity to see. At the beginning of the troubles the earl transported himself and his collection to Antwerp, and dying not long after at Padua he divided his personal estate between his sons Henry Lord Maltravers and Sir William Howard Viscount Strafford.

### The Theseion, Athens.

This monument still shows upon the whole of its external surface well-preserved remains of a coating of colour, the material substance of which is least of all decayed on the south side of the building, although the actual colour has vanished through the effect of time, or has changed its hue. It is only here and there—chiefly in crevices or in hollow surfaces—that, by carefully scraping off the external crusts, we can meet with the actual pigment employed. Traces are found of two different species of red (namely, a warm brick red on the columns, the architrave and the general surface, and a very light cinnabar red on some of the ornaments), two blues (azure, or sky blue, used for the masses, and a deeper blue employed for the ornaments), green and some rather doubtful traces of gilding. The high-reliefs were also completely encrusted with colours, the remains of which are still plainly discernible in the folds of the draperies. The drapery of a sitting figure on the frieze above the portico of the temple shows itself to have been of a beautiful rose tint; in other parts green appears to have been the prevailing colour. The ground itself of the frieze was blue, and a large portion of the surface is still covered with it. Beneath the neck of the anta of the opisthodomos of this temple, on that side of it which is turned towards the columns in antis, there is still remaining a fragment of blue colour, about the size of a man's hand, and the whole of the cella appears to have been covered with it. In the niches which were afterwards constructed, in Christian times, between the antæ of the

portico out of fragments of the ceiling of the temple, we meet with some that are still either entirely or partly covered with the original glasslike enamel. The wall in the interior of the cella, from the deep socle to the height of six courses of stone, has been entirely coated with a thicker stucco, as the chiselled surface of the stones and the pieces of stucco still adhering to it plainly enough prove. Nor can we imagine that this careful tooling of the surface with the chisel was the work of after-times, because, had they found the face of the wall smooth, the Christians would have painted upon that without further preparation, as we find them to have done in the Parthenon.

#### Persian Architecture.

In the Persian empire the Arab conquerors found an architecture which excelled rather in the richness and costliness of its details than in the beauty and variety of its leading forms. From these details all Mohammedan architecture appears to have derived much of its characteristic ornamentation. The edifices of Persia of this period were chiefly distinguished by a great vaulted hall, generally of the entire height of the building and completely open at one end to the air, having thus the appearance of a vast porch. This central hall was flanked on both sides by many small rooms, usually vaulted and arranged in two or more storeys either lighted from the hall or opening into each other without windows. They were thus kept dark and cool during the heat of summer. Sometimes these rooms were surmounted by domes. In front of the edifice was a spacious court. Although this architecture cannot boast of any true dignity or any beauty of the highest order, or of the solid massiveness of other styles, yet it admits of many very elegant and pleasing combinations, and is admirably fitted to the exigencies of the climate and to the tastes and manners of the people. Rills of water are led through the halls, and breaking into tiny cascades or raised into sparkling jets, cool the air and lull the senses by their gentle murmur. Trees, beds of roses, and other sweet-scented flowers and abundant fountains adorn the inner courts. The walls are covered with enamelled tiles or painted with tracery of many colours and exquisite design, and with verses from the poets in the interlacing letters of the Persian character. The ceilings are inlaid with countless small mirrors. Costly carpets and embroidered hangings of the most exquisite texture and of the most harmonious yet brightest hues form the only furniture. Plain brickwork, without a window or a cornice to break the monotony, usually faces the street, and a low doorway and a dark passage lead into the garden court. Such are the palaces of Ispahan and the mansions of the nobles of Persia; within a very paradise of luxury and taste, but outside mean and unadorned. The most important ancient monuments of this type still existing are the Palace of Al Hadhr, a magnificent edifice of hewn stone, probably of the Arsacid period, still rising majestically in the solitude of the Mesopotamian desert, the remains of the palaces of the Seleucid kings at Serbistan and Firouzabad in Persia, and especially the vast ruin of Ctesiphon on the Tigris.

#### Sir Godfrey Kneller.

Had Kneller lived in a country where his merit had been rewarded according to the worth of his productions instead of the number, he might have shone in the roll of the greatest masters; but he united the highest vanity with the most consummate negligence of character—at least, where he offered one picture to fame, he sacrificed twenty to lucre; and he met with customers of so little judgment that they were fond of being painted by a man who would gladly have disowned his works the moment they were paid for. Ten sovereigns sat to him, viz. Charles II., James II. and his queen, William and Mary, Anne, George I., Louis XIV., Peter the Great and the Emperor Charles VI. Not one of them discovered that he was fit for more than preserving their likeness. We, however, who see King William, the Czar Peter, Marlborough, Newton, Dryden, Godolphin, Somers, the Duchess of Grafton, Lady Ranelagh and so many ornaments of an illustrious age transmitted to us by Kneller's pencil, must not regret that his talent was confined to portraits—perhaps the treasure is greater than if he had decorated the chambers of Hampton Court with the wars of Æneas or the enchanted palace of Armida, and when one considers how seldom great masters are worthily employed, it is better to have real portraits than Madonnas without end. What Sir Godfrey's genius could have produced must not be judged by the historic picture of King William in the palace just mentioned; it is a tame and poor performance. But the original sketch of it is struck out with a spirit and fire equal to Rubens. The hero and the horse are in the heat of battle; in the large piece it is the king riding in triumph, with his usual phlegm. Of all his works Sir Godfrey was most proud of the converted Chinese at Windsor; but his portrait of Gibbons is superior to it. It has the freedom and nature of Vandyke, with the harmony of colouring peculiar to Andrea Sacchi; and no part of it is neglected. In general, even where he took pains, all the parts are affectingly kept down, to throw the

greater force into the head—a trick unworthy so great a master. His draperies too are so carelessly finished that they resemble no silk or stuff the world ever saw. His heads have extreme grace; the hair admirably disposed; and if the locks seem unnaturally elevated it must be considered as an instance of the painter's art. He painted in an age when the women erected edifices of three storeys on their heads. Had he represented such preposterous attire, in half a century his works would have been ridiculous. To lower their dress to a natural level when the eye was accustomed to pyramids would have shocked their prejudices and diminished the resemblance. He took a middle way, and weighed out ornament to them of more natural materials. Still, it must be owned there is too great sameness in his airs and no imagination at all in his compositions. See but a head, it interests you—uncover the rest of the canvas, you wonder faces so expressive could be employed so insipidly. In truth, the age demanded nothing correct, nothing complete. He sometimes in the haste of finishing left part of the primed cloth uncoloured. This fault, which in Kneller proceeded from haste and rapaciousness, was affectingly imitated by some of the painters who succeeded him, while his great reputation was still in vogue. Yet with all Sir Godfrey's desire of acquiring riches, he left 500 portraits unfinished, for his customers were not equally ready to pay as to sit. There is an entertaining account of these facts in Rouquet's "State of the Arts in England."

#### Repose in Sculpture.

An ancient sculptor sometimes only executed one statue in his lifetime. It was his entire history. He brought it every day to greater perfection. If he himself loved, or was the object of that passion; if he received from nature, or from the fine arts, any new impression, he embellished the features of his hero both from his recollections and his sentiments. He knew in this manner how to bring to view all the feelings of his soul. In modern times, in the midst of a state of society so cold and oppressive, the expression of pain is a most noble feature, and in our days the person who has not suffered has neither felt nor thought. But there was in ancient times something more noble than the expression of pain. It was that of an heroic calm and that consciousness of intellectual strength which might be developed under free and generous institutions. The first statues of the Greeks express only repose. The Laocoon and Niobe are the only ones which express violent pain, but it is the vengeance of heaven that they represent and not the innate passions of the human heart. One scarce finds any trace of the melancholy in their statues. A head of Apollo in the Palace Justiniani and another of Alexander dying, are the only ones in which the dispositions of a mind engaged in reverie or suffering affliction are painted. But they both belong, according to appearances, to those times when Greece was enslaved. From that period there no longer existed that pride or tranquillity of soul which have produced among the ancients the *chef-d'œuvre* of sculpture and of poetry composed in the same spirit.

#### Eleanor Cross at Hardingstone.

SIR,—The Eleanor Cross at Hardingstone, near Northampton, has been undergoing inspection by the Northamptonshire County Council, on the occasion of its passing into their possession. The scaffold which has been erected will remain in position for a week or two longer, and an excellent opportunity is thus afforded for measuring the whole structure, provided the weather is not too severe.

The County Council would be glad to possess a good set of drawings, and if any student cares to take this opportunity of measuring a subject which has not yet been properly undertaken, I shall be glad if he will communicate with me as soon as possible.—Yours faithfully,

J. ALFRED GOTCH.

West Hill, Kettering: December 30, 1901.

#### St. Alban, Wood Street.

SIR,—On page 363 Mr. Bumpus says, in his very interesting article, Stained Glass, "St. Alban, Wood Street (one of Wren's Gothic)." In 1864 I had occasion to read the records of St. Olave, Silver Street, from which I learned that that parish after the Great Fire in 1666 contributed 206*l.*, being one-third the expense of repairing and refurnishing the church of St. Alban, Wood Street. The church of St. Olave was a timber building and had been re-erected about fifty years before the Fire, and was said to have been wholly consumed, while St. Alban's was a stone building and damaged only. The late Rev. H. Irwin-Cummins, who was the rector of both parishes, 1856 and sequitur, told me he believed the

church, St. Alban's, was partly rebuilt early in the sixteenth century. But the records of the parish, removed probably at the Fire, never returned to the church, and the record of the building of St. Alban's was therefore lost. It was, however, certain that the church was not designed by Wren, and that the repairs were only superintended by "Mr. Wren's clerk," who is more than once mentioned by the recording churchwarden of St. Olave, and received a gratuity for his services.

I have just looked up some notes I had made in 1864, and as they may interest you, I subjoin them:—

1685—Joiners' work, carvers & ors.	£451	0	0	
Carpenters	89	0	0	
Locks and other ironwork	25	0	0	
Smiths	17	16	9	
Wm. Mildman, carved work	£2	8	4	
Painting altar-piece	5	6	8	
Pewing		33	0	0

Total of repairs under the direction of Sir

Christopher Wren . . . . . £615 16 9

I have recently learned that these old books cannot now be found.—Yours truly,  
J. FUNSTON.

### GENERAL.

**M. André Goubin**, in order to obtain the rank of doctor in literature from the Sorbonne, has sustained as theses "The Sarcophagi of Clazomène" and "Greek Sculpture in the Period between the Persian Wars and the Age of Pericles."

**A Vote** of 260,000 francs has been approved by the French Chamber for works of restoration at Versailles and the Trianons.

**A Volunteer Company** of electrical engineers is being prepared for active service at the express wish, it is stated, of Lord Kitchener.

**The Glasgow Corporation** have purchased for the Art Gallery one of Mr. Harry Spence's International Exhibition pictures, "The Gondola."

**The Completion** of the Metropolitan Railway by a line from the Place du Danube, at the extremity of Paris, to the Palais Royal, and by another from Auteuil to the Opéra, has necessitated a fresh municipal loan of 150,000,000 francs.

**Plans** for a new technical institute to cost about 100,000*l.* have been adopted at a special meeting of the Corporation of Belfast.

**Messrs. Walter Macfarlane & Co.**, Saracen Foundry, Possilpark, have offered to sell to the Corporation of Glasgow at the price of 500*l.* the large spray fountain lent to the Exhibition and standing in Kelvingrove Park.

**Mr. Luigi Ricci** will lecture on the 13th inst. at the College of Preceptors, Bloomsbury Square, to the Educational Conference, on "Giotto and the Italian Renaissance."

**Mr. A. C. Brown**, chief agent and engineer at Seaham Harbour to Messrs. Pearson & Co., Ltd., contractors, of Westminster, was killed on Saturday when superintending the construction of Lord Londonderry's new deep-water dock.

**Dr. Arthur Smith Woodward** has been appointed Keeper of the Department of Geology in the Natural History Museum, in succession to Dr. Henry Woodward, F.R.S., retired, under the age-limit rule, after forty-two years' service in the department.

**The "Record"** of the winter meetings and summer excursions by members of the Upper Norwood Athenæum has appeared as a small volume. The contents are of great interest to inhabitants of the Metropolis, for they relate to places which can be visited without much difficulty. The pages are illustrated by reproductions of photographs. The "Record" must do good service in extending a knowledge of archaeology.

**Major Haag**, of the 18th Hussars, who was severely wounded at Tweefontein, is the son of Mr. Carl Haag, the water-colour painter.

**Mr. Pirrie**, of the firm of Messrs. Harland & Wolff, is constructing a barge for use on the Thames by the Lord Mayor at the Coronation ceremonies.

**The French Society of Engraving** has presented to the Louvre a series of plates by Jacquet, Flameng, Sulpis and Patricot.

**Subscriptions** have been sent from American admirers to aid in the completion of the memorial of Charles Garnier, which has been greatly delayed and cannot be completed until several months have elapsed.

**Mr. J. S. Gibson** writes us that his offices are now removed to 27A Old Bond Street, London, W., where his practice will be carried on, together with that of Mr. William Wallace, under the designation of Messrs. Wallace & Gibson, architects.

**Moorgate Station**, on the City and South London Electric Railway, has been seriously affected by subsidences, believed to be due to railway works now in progress below the level of Finsbury Pavement.

**The Prizes** founded by American architects to reward students of architecture in the Ecole des Beaux-Arts have just been awarded to MM. Nicod, Danis and Hubaine.

**A Stained-Glass Window** has just been unveiled in St. John's Church, Sandown, Isle of Wight, in memory of Lance-Corporal Ashley W. Arnell, 1st Volunteer Company Hampshire Regiment, who died of enteric fever contracted in South Africa. The window represents three Old Testament warrior saints, Joshua, David and Gideon, and was designed and executed by Messrs. W. James & Co., of London.

**Goods Waggons**, 40 feet long and capable of carrying 30 tons, the load of three ordinary freight trucks, will soon be running on the Lancashire and Yorkshire Railway.

**The Paris Municipal Council** have subscribed for twenty-one copies of the new album which is to contain reproductions of the principal paintings by Meissonier.

**An International Exhibition** is likely to be opened in Sydney, New South Wales, early in 1904.

**Mr. Sydney Protheroe**, sanitary inspector of Hereford has been appointed sanitary inspector of Kimberley, having been selected from among eighty applicants.

**The Institution of Civil Engineers** will discuss at their next meeting on January 14 a paper on "American Workshop Methods in Steel Construction," by Mr. H. Bridges Molesworth.

**Cambridge University** has made a grant of 90*l.* to Mr. R. C. Bosanquet, M.A., of Trinity College, director of the British School at Athens, to be used for the expenses of members of the school engaged in excavations at Cyzicus.

**The Association of Master-Painters in Ireland** have made arrangements to hold a four days' convention and exhibition in Dublin, commencing on January 7. The convention and exhibition will include (1) a loan collection of drawings by the leading British decorators; (2) an exhibition of decorative materials; (3) a series of meetings at which papers will be read and discussed; (4) a competition open to apprentices, in which will be shown some of the results that have followed the efforts which for some time past have been most earnestly made to further the education of young decorators.

**The Westminster City Council**, acting on the advice of their engineer, have decided to purchase, by way of experiment, twenty oil lamps sprayed by compressed air, which are to be used during foggy weather.

**The Egyptian Temples of Luxor and Karnak** are to be lighted by electricity.

**The Liverpool Architectural Society** will hold its fourth ordinary meeting on Monday next in the Law Library, 41 Castle Street. Mr. C. J. Anderson will take the chair, and a paper on "Old English Cottages," illustrated by limelight views, will be read by Mr. James Parkinson.

**A Special General Meeting** of the Manchester Society of Architects will be held in the board-room of the Chamber of Commerce, 44 Mosley Street, Manchester, on Thursday next, January 9, at 6.45 P.M., for the purpose of electing Mr. Hugh Stannus, F.R.I.B.A., 2 Plymouth Grove, Chorlton-on-Medlock, as a Fellow, and Mr. Thomas Brammall Daniel, 18 John Dalton Street, Manchester, as an Associate of the Society. After the general meeting, the fourth sessional papers meeting will be held, when Mr. J. D. Crace, Hon. A.R.I.B.A., will read his paper, entitled, "Relation of Colour to Architecture."

**Mr. William Clarkson, F.S.I.**, who was for nearly nine years with Messrs. Douglas Young & Co., auctioneers, &c., of 61 Coleman Street, E.C., has, as he informs us, just started in business on his own account at 9 and 10 Fenchurch Street as surveyor, auctioneer and valuer, and land and estate agent. At Messrs. Douglas Young & Co.'s "staff dinner" on Saturday last Mr. Clarkson's late colleagues took advantage of the occasion to present him with a handsomely illuminated address, bearing their signatures to the number of thirty-seven, and a substantial travelling trunk and Gladstone bag, while Mr. Douglas Young, in making the presentation of a beautiful clock, spoke highly of the pleased recipient, to whom he wished every success in his future career.

**The Foundation-stone** on New Year's Day was laid at Harrogate of a handsome Kursaal, which is about to be erected at a cost of 40,000*l.* There are to be a café and refreshment-rooms, a smoke-room and a billiard-room for the men, and the Spa Gardens, which adjoin, for promenading. The concert hall is, however, the main feature. It replaces the old concert-rooms, which have so often proved inadequate for their purpose. The new Kursaal should prove an important addition to the already numerous attractions of this fashionable resort.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

**BATTERSEA.**—Jan. 31.—Premiums of 50*l.*, 25*l.* and 10*l.* respectively are offered for the three best sets of designs, &c, of dwellings, as follows:—(a) A house of two storeys; (b) a house consisting of two self-contained tenements; and (c) a house consisting of three self-contained tenements. Mr. W. Marcus Wilkins, town clerk, Municipal Buildings, Lavender Hill, S.W.

**GLASGOW.**—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

**HULL.**—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

**IRELAND.**—Jan. 20.—Plans, &c, are invited for drainage of Howth and Sutton, Dublin (and an alternative system for the latter). A premium of 50*l.* is offered. Mr. John O'Neill, clerk, board-room, North Brunswick Street, Dublin.

**ISLE OF WIGHT.**—Jan. 31.—Designs are invited for a suitable monument as a memorial to Her late Majesty, to be erected in St. James's Square, Newport, Isle of Wight. A premium of 25*l.* is offered for the accepted design. The Secretary, Isle of Wight Queen Victoria Memorial Committee, 20 Holyrood Street, Newport, Isle of Wight.

**LANGHO.**—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200*l.*, 150*l.* and 100*l.* respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**LOWESTOFT.**—Jan. 11.—The committee of the Royal Norfolk and Suffolk Yacht Club offer to architects premiums of 25*l.*, 20*l.* and 15*l.* respectively for the three best designs for a new clubhouse at Lowestoft, to cost about 4,200*l.* Mr. H. Townsend Clarkson, secretary, Lowestoft.

**SCOTLAND.**—Jan. 15.—The Kirkcaldy Burgh School Board invite competitive plans for a technical and science and art school to accommodate from 400 to 500 pupils, and an elementary school to accommodate about 400 pupils. Mr. Alexander Beveridge, clerk to the Board.

**WALES.**—Feb. 4.—Competitive designs are invited for municipal offices proposed to be erected by adapting, adding to and rearranging the town hall buildings at Mountain Ash. A premium of 75*l.* will be paid to the author of the design placed first in order of merit. Mr. H. P. Linton, clerk, Town Hall, Mountain Ash.

## CONTRACTS OPEN.

**AMBLE.**—For erection of Primitive Methodist church, schools and minister's house at Amble. Mr. T. E. Davidson, architect, 14 Neville Street, Newcastle-on-Tyne.

**ASHTON-IN-MAKERFIELD.**—Jan. 8.—For supply of a steam road-roller, 12½ tons, a scarifier and a sludge and snow remover. Mr. J. W. Liversedge, surveyor, Council Offices, Ashton-in-Makerfield.

**ASHTON-UNDER-LYNE.**—Jan. 8.—For taking-off the roofs to lanterns over the laundry and kitchen at the workhouse and constructing skylights in lieu thereof. Messrs. John Eaton, Sons & Cantrell, architects, Stamford Street, Ashton-under-Lyne.

**BARNSTAPLE.**—Jan. 16.—For erection of buildings in connection with the proposed electricity works in Castle Street. Mr. James Bosson, town clerk, Barnstaple.

**CHIPS, DUST, SHAVINGS,**  
**STURTEVANT**  
**SYSTEM.**

SEND FOR SPECIAL CATALOGUE, "E 13."

**STURTEVANT ENGINEERING CO. LTD.** 147 QUEEN VICTORIA STREET, LONDON.  
**PARIS. BERLIN. STOCKHOLM. AMSTERDAM. MILAN.**

INSTANTLY COLLECTED AND  
 REMOVED FROM  
**WOOD - WORKING MACHINERY,**  
**BUFFING & EMERY WHEELS,**  
 &c.

**BARNSTAPLE.**—Jan. 16.—For supply and erection of the electric-lighting plant. Mr. W. H. Trentham, 39 Victoria Street, Westminster, S.W.

**BERMONDSEY.**—Jan. 20.—For construction of three underground conveniences. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BOURNEMOUTH.**—Jan. 6.—For supply of electric-lighting plant. Mr. F. W. Lacey, borough and tramway engineer, Municipal Offices, Bournemouth.

**BRATTON FLEMING.**—Jan. 6.—For constructing a tunnel about half a mile in length, in the parish of Bratton Fleming, in the county of Devon, in connection with the new water scheme. Surveyor, Town Hall, Ilfracombe.

**BREWOOD.**—Jan. 20.—For reseating in oak the nave of the parish church. Mr. Ashton Veall, architect, 84 Darlington Street, Wolverhampton.

**BRIDGEND.**—Jan. 6.—For erection of business premises at the corner of Wyndham and Adare Streets, Bridgend. Mr. P. J. Thomas, architect, Bridgend.

**BRIDLINGTON.**—Jan. 7.—For erection of a chapel at North Burton. Mr. Samuel Dyer, architect, Quay Road, Bridlington.

**BROMSGROVE.**—Jan. 8.—For sinking or boring to obtain a water supply for the new Barnsley Hall asylum. Mr. George T. Hine, architect, Westminster.

**BURY.**—Jan. 20.—For construction of a central tramway dépôt in Rochdale Road, Bury. Mr. Arthur W. Bradley, borough engineer, Bury.

**CARLISLE.**—For repaving and refitting stable, &c., at Hallburn workhouse, Longtown. Mr. Jas. Murray, district surveyor, Kirkcubbin, Carlisle.

**DERBY.**—Jan. 14.—For erection of two steam-roller sheds and men's messroom, Bateman Street Yard. Mr. H. F. Gadsby, town clerk, Tenant Street, Derby.

**EXETER.**—Jan. 8.—For erection of the West memorial cricket pavilion on the county cricket ground, Exeter. Messrs. E. H. Harbottle & Son, architects, County Chambers, Exeter.

**GUILDFORD.**—Jan. 13.—For erection of a corn exchange in the cattle market in Woodbridge Road. Mr. C. G. Mason, borough surveyor, Tuns Gate, Guildford.

**HAMPSTEAD.**—Jan. 9.—For alterations and repairs at the Hampstead public baths, 175 Finchley Road, N.W. Mr. O. E. Winter, borough engineer, Town Hall, Hampstead.

**HARTLEPOOL.**—Jan. 25.—For erection of a generating station, and the supply and erection of plant, viz. (section 1) erection of buildings; (2) boilers, two of marine type; (3) engines and dynamos, steam, feed and exhaust pipes, valves and other apparatus; (4) storage battery; (5) switch-board; (6) arc lamps; (7) feeder mains, arc-light leads, &c.; (8) arc-lamp columns and brackets; (9) overhead travelling crane. Mr. C. Robson, borough accountant, Hartlepool.

**HOLYHEAD.**—Jan. 7.—For erection of an infant school at Kingsland. Mr. R. E. Pritchard, clerk to School Board, Bradford House, Holyhead.

**HORNSEY.**—Jan. 15.—For supply and erection of electric-lighting plant at the municipality electricity works. Mr. F. D. Askey, clerk, Council Offices, Southwood Lane, Highgate, N.

**IRELAND.**—Jan. 13.—For raising the tiled floors and relaying same with boards in twenty-five houses of the Charles Shiels's Institution, Killough. Mr. George M. Swail, superintendent.

**IRELAND.**—Jan. 14.—For erection of a labourer's cottage and fencing a plot allotted to it in the townland of Clontail (electoral division of Killary), Ardee. Mr. Louis Turley, engineer, 17 Laurence Street, Drogheda.

**KING'S NORTON.**—Jan. 6.—For erection of a refuse destructor at Lifford, near King's Norton, Worcestershire. Mr. Ambrose W. Cross, surveyor, 23 Valentine Road, King's Heath, near Birmingham.

**LITTLEBOROUGH.**—For erection of four houses in Hollingworth Road, Littleborough, Lancs. Mr. Thomas Wild, Ingham's Lane, Hollingworth Road, Littleborough.

**LIVERPOOL.**—Jan. 27.—For construction of public baths at Lister Drive, West Derby. Mr. W. R. Court, engineer and chief superintendent, Municipal Offices, Liverpool.

**LONDON BRIDGE.**—Feb. 17.—For widening of London Bridge. Drawings and specification may be seen at the office of the City Surveyor, Guildhall.

**LUXULYAN.**—Jan. 22.—For restoration of Lockingate district church, Luxulyan, Cornwall. Specifications can be seen on application to the Vicar.

**MACCLESFIELD.**—For extension and alteration of the bakehouse at the Parkside asylum. Mr. H. Beswick, county architect, Newgate Street, Chester.

**MANCHESTER.**—Jan. 7.—For laying and jointing of the southern section of the second line of pipes from Thirlmere to

## FISHBURN'S

# LABOUR SAVING WINCHES

The Machine is so named because of its adaptability as a means of lifting or lowering articles and materials of every kind with great despatch and safety.

By its use in Building operations ordinary Wheel-barrows, Hand-barrows, Baskets, Buckets, or other receptacle, being used, the loaded one ascends while the empty one descends.

THE COST OF THE MACHINE SAVED IN A FEW WEEKS.  
They are in use in many parts of the United Kingdom,

For Catalogues, Prices, Testimonials, &c., apply to

S. KAVANAGH, Surbiton Hill (accepted) . . . 1,674 12 3

At the West Kirby Convalescent Home a school has been  
erected to afford an opportunity for the children of the home to  
receive elementary education on five days in the week, and  
this being now completed it was opened on the 27th ult. The  
new school, which has been erected as an addition to the main  
building, is about 25 feet square, and will comfortably accom-  
modate 22 children. The room is lighted by electricity, while,  
of course, extra care has been exercised in the matter of  
arrangements for the heating and ventilation. The furniture  
as well is of a special nature, and has been selected by the  
doctors and teachers. Around the walls are a number of  
blackboards, upon which Miss Alice Horton had sketched a  
number of amusing pictures for the delectation of the children.

## TENDERS FOR THE YEAR 1901.

THE following are a few of the more important works that were  
estimated for during 1901, the tenders for which appeared in  
our columns in the course of the year:—

PLIABLE AND FLEXIBLE. DOES NOT CRACK.

VICTORIA BRIDGE, MANCHESTER.

## THE MAY-OATWAY FIRE ALARM

Licensed by H.M. Postmaster-General.

No greater fire loss than £10 has ever happened in any building protected by this system, and no one has ever been injured or lost. Whether the premises are occupied or not it is impossible for any fire to burn for more than a few seconds without giving its own alarm, and that at a period early enough to insure its suppression by half a dozen buckets of water. Approved by every Tariff Insurance Office and Fire Brigade in New Zealand, and solely used by the Government of that Colony for the protection of national property where the lives of inmates are concerned.

SIR EYRE M. SHAW (late London Fire Brigade), Chairman.

53 New Broad Street, E.C.; 40 Victoria Street, S.W.; and Merryweather's, Limited.

"The Glass I am perfectly satisfied with; GREAT SUCCESS."

"Compared with Polished Plate Glass 'Refrax' gives TWICE AS MUCH LIGHT FOR EQUAL COST."

Sold by all Dealers.

Same Interior lighted by "Refrax" Glass.

## "TAYLOR'S PATENT JUNCTION"

No. 12662.

For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &amp;c.

APPROVED BY ALL SANITARY AUTHORITIES.

THIS Junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the many angles required for the various makes, also to avoid the necessity of having joints inside the walls, which are dangerous and not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can be adapted to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this article, as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. A perfect Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint, all that is necessary is to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back the Lead Pipe 1/2 inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together and draw up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made and will stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all that is required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left intact. With all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property and causing other inconvenience.

A—Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.

B—Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.

C—Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in. x 1 1/2 in. Invert Junction for Anti-siphon Pipes, &amp;c.

D—Shows how to arrange for a small sized branch.

Made in Three Strengths—Ordinary Rain Water, 1/2" and 3/4" Metal.

PRICES AND PARTICULARS CAN BE HAD AT ALL WHOLESALE MERCHANTS, OR FROM

CHARLES TAYLOR, R.P., Sanitary Engineer, ECCLES, MANCHESTER.

CONSTRUCTIONAL & SANITARY ENGINEERING WORKS,  
IN TOWN AND COUNTRY.

They have a large and competent staff, and can always arrange for a representative to wait upon clients to suit their convenience.

WARMING APPARATUS BY STEAM AND HOT WATER.

COOKING APPARATUS OF SPECIAL DESIGN. STOVES & INTERIORS.

DESIGNS, PLANS AND ESTIMATES FREE OF CHARGE.

## NEW CATALOGUE.

WE have received from Messrs. Lumby, Son & Wood, Ltd., of Halifax and Greetland, Yorks, a copy of the Twentieth Century Catalogue, which contains particulars of wrought-iron and steel welded and rivetted boilers manufactured by them for heating apparatus on the low-pressure hot-water and low-pressure steam systems, also of kitchen-range boilers, Cornish boilers, vertical steam boilers, &c. This catalogue, which is excellently got up and illustrated, contains useful tables for architects and much information, and in an early issue we hope to refer more fully to it. We notice that the gold medal was awarded at the Paris Exhibition, 1901, to Messrs. Lumby, Son & Wood, Ltd.

## TRADE NOTES.

THE Union Offices, Todmorden, are being fitted with the latest improved hot-water heating apparatus by John King, Limited, engineers, Liverpool, employing their "Rahnee" radiators and "Rex" radiator valves.

MACKAY'S patent direct-acting invisible roof ventilators, supplied by Messrs. Cousland & Mackay, ventilating engineers, Glasgow and Manchester, are being used in the ventilation of the new Consumptive Home at Barnhill, Perth.

MESSRS. GENT & CO., electric-light engineers, of Faraday Works, Leicester, inform us that since the fire which took place at their works recently they have been able to secure extensive premises adjoining their own works, where they are making a start, so that little or no delay beyond the Christmas holidays will take place in the execution of orders.

MESSRS. FISHER, SON & WEAVER, of West Bromwich (Staffs), have recently received orders for the whole of the furniture, dual desks, cupboards, teachers' desks, &c.; for the large schools to accommodate 1,000 to 1,500 children each for the Swansea, Willesden (London), Croydon, Hanwell (London) and Norwood (London) School Boards. The desks selected in each case have been the new "Kingfisher Dual Desks," and each Board made the selection from samples submitted by nearly all the chief firms of school furniture makers in the trade.

THE "B. & S." Folding Gate Company have recently received orders for Kinnear's steel rolling shutters from the Nottingham Corporation, who have adopted them for their tramway depôt for fifteen entrances; four also have been fitted by them at Cardiff for the Corporation and nine are being fitted

at Wallasey and two at the new electric generating station at Bow. For the Leicester Corporation this company have just supplied twenty-eight pairs of the "B. & S." folding gates for the wholesale fruit and vegetable markets.

MESSRS. PILKINGTON BROS., LTD., of St. Helens, Lancashire, are sending out a neat and attractive little illustrated pamphlet descriptive of their patent prismatic rolled glass. For this glass, which we described on its introduction, the following advantages are claimed:—It is of good appearance and is stronger than sheet glass, being less liable to be broken. Efficiency in work is greatly promoted by it, and it virtually increases floor space. It is easy to apply; any glazier can fix it. It avoids vitiated air, dirt and blackened ceilings, caused by burning gas. The diffused light is especially beneficial to the eyesight. The heat of the sun is also diffused, contributing to a uniform temperature. It is a safeguard against fire, avoiding many dangers arising from artificial lights, and illuminating dark corners so often made receptacles for dangerous refuse. It enhances the letting value of property by improving the light, and saves gas bills.

THE Edison and Swan United Electric Light Company, Ltd., have received the honour of appointment by Royal Warrant as purveyors of electric lamps to His Majesty the King.

THE library and baths committees of the Leeds Corporation met on the 24th ult. to consider the plans sent in for the proposed baths and branch library, in York Road. Sixteen sets of plans (all by Leeds architects) were exhibited, and a selection made which will be submitted for approval at the next meeting of the Council. The recommended awards are as follows:—1st, 50%, Mr. J. A. Chapman, East Parade; 2nd, 30%, Mr. W. Bakewell, Park Square; 3rd, 15%, Mr. Percy Robinson, Albion Street. The plans preferred provide for a building of two storeys, costing some 15,000*l.* The library, which is to be built of stone and brick, will have a frontage to York Road, whilst the baths will extend down All Saints Place at the back. The ground-floor of the library is to comprise a lending library, newsroom and ladies' room; and on the first floor will be erected a lecture hall, boys' library and reading-room. The lecture hall, which is intended for public meetings, forms a novel feature of the building. A clock and ornamental cupola also enter into the design. The baths are to be fitted up in the most approved modern style.

ALSO AT LIVERPOOL, MANCHESTER, PARIS, AND CAPE TOWN.

**ELECTRIC NOTES.**

THE town of Dingwall, N.B., contemplates the employment of the tidal flow of the canal and the Peffrey River to provide it with electric light. The total capital outlay is estimated at 4,000*l*.

ELECTRICAL engineers are unanimous in appreciating the necessity of sending out their currents at a high voltage, because the breakage of power and the waste and cost of carrying it along conductors is less.

AT Alloa, N.B., the work of laying the cables for the electric lighting of the principal streets is nearing completion. Nearly all the pillar lamps have been erected, and a section of these and also the municipal buildings were lighted with the electric light for the first time on Monday evening. It is expected that nearly all the lamps will be switched on by to-night.

IN connection with the scheme for the electrification of the Mersey Railway, a contract for about sixty cars, of the value of 40,000*l*., has been placed with Messrs. G. F. Milnes & Co., of Birkenhead, and Hadley, Salop, and cars will be built at the works at Hadley. The cars will be 60 feet long, seat about seventy persons, and will be of a very handsome style. After the disaster on the Overhead Railway at Liverpool, it is interesting to know that for a certain distance under the new cars over the motors will be placed fireproof asbestos slate. The compartments for the motor man and the luggage will also be lined with the fireproof material, so that danger by fire through the fusing of the motors will be almost eliminated.

IN order to meet the increasing demand for electric light in Shrewsbury, the Town Council have several times been compelled to extend the machinery during the four years the undertaking has been in their possession. The latest of these extensions included the erection of a new engine, and this was formally "opened" by the mayor (Mr. S. M. Morris) at a meeting of the lighting committee held at the works on the 23rd ult. The new set of machinery is of 350 brake horse-power, and the dynamos are of 242 kilowatts capacity, capable of supplying 4,000 16 candle-power lamps burning at one time. The engine was manufactured by Messrs. Bellis & Morcam, Birmingham, and the dynamos by Messrs. Thomas Parker & Co., Wolverhampton. The estimated cost was 2,650*l*., and the work has been done to specifications supplied by the borough electrical engineer (Mr. C. M. Johnston), who has from the commencement of municipal electric lighting in Shrewsbury had much to do with the success which has attended the

undertaking. He has been fortunate in having the support of an enterprising committee, with a chairman whose interest in and knowledge of the work are beyond praise.

AN important and in some respects novel installation of electrical power for manufacturing purposes has just been completed at the Saltley works of the Metropolitan Railway Carriage and Waggon Company. Electric power is now in use throughout the whole of the works, and it is generated and applied on the most advanced principles. Alternating current two-phase, Westinghouse type, "C" motors, varying in size from 50 horse-power downwards, are used in all cases. These motors require no expert attention. They are efficient, self-starting under load, have no exposed electrical parts, and no wearing parts except the two shaft bearings. The electrical system is thus the most modern of any. The method of generating the electric power exhibits a still more striking advance. Steam-engines have been abandoned in favour of gas-engines. Instead of burning coal under steam-boilers, the coal is now served to a gas-producing plant, and engines, working with this gas supply, drive the dynamos. Westinghouse three-cylinder gas-engines are used. This type of engine was introduced about two years ago, and is rapidly revolutionising methods of power-generation and workshop driving. This can be easily understood when it is considered that all the advantages of the best type of steam-engines are in this new gas-engine combined with far greater economy. This has been proved by experiments on several installations, and stringent tests recently made on the Saltley plant under actual working conditions have confirmed the truth of these claims.

**VARIETIES.**

THE Archbishop of Canterbury visited Folkestone on the 30th ult. for the purpose of opening a new Church house, schools and recreation hall, erected as a memorial to the late Canon Matthew Woodward, vicar of Folkestone for over half a century.

THE most important year's work for a period of forty years in connection with the isolation of infectious disease in the Carlisle Fever Hospital has just been completed. The hospital stands within its own grounds to the north-west of the city, and recently additions were made to it at a cost of from 3,000*l*. to 4,000*l*.

Price 2*s*.—Office: Imperial Buildings,  
Ludgate Circus, London, E.C.

A NEW Congregational church has been built at Victoria Park to replace the church in Hanbury Street, E., so long associated with the ministry of the late Dr. Tyler. That building has been demolished, owing to the site having been acquired by the London School Board, and the pews, gallery fronts, &c., from the old church have been utilised in the new building. Accommodation has been provided for 800, and the school and classrooms make altogether an admirably equipped block of buildings.

A SINGULAR accident occurred on the North-Eastern Railway near Choppington (Northumberland) station on the 30th ult. Bordering the railway are some brickworks, and a large chimney connected with these suddenly collapsed and fell across the line. At the time there was a guard's van in the vicinity, and the falling brickwork crashed into it. Unfortunately, a mineral guard named Beattie was in the vehicle, and he was seriously injured. Choppington station is on the Blyth and Tyne section, between Newcastle and Morpeth, and in consequence of the accident the railway traffic was interrupted for some hours.

AN old timber-built tenement in King's Court, Great Suffolk Street, will shortly be demolished. It stands opposite the site of the Bridewell that was built circa 1773 upon Hangman's Acre, where is now the junction of Friar and Hill Streets. The house was taken just 100 years ago by a congregation who had separated themselves from the Baptist community in Union, formerly Duke Street. A tradition is current that Bunyan sometimes preached in the meeting-house in King's Court, as well as in that belonging to his friend Dr. Thomas Barlow, in Zoar Street, Slutswell (since Gravel Lane), in the course of his frequent visits to London.

THE handsome new town hall, which has been in course of erection at Colchester for several years past, was last week thrown open for the inspection of the local public. The foundation-stone of the hall was laid by His Royal Highness the Duke of Cambridge in October 1897. The hall was designed by Mr J. Belcher, and the contractors were Messrs. Kerridge & Shaw, of Cambridge. The amount of the contract was 33,397*l*. At the south-east corner of the hall is an elegant tower, erected at an extra cost of 2,500*l*. This addition was named the Victoria Tower, by special permission of Her late Majesty. The assembly-room is a fine apartment, nearly 100 feet long by 45 feet wide. Its vaulted roof is supported by fluted columns, on whose capitals are portraits of twenty-two

English sovereigns who at various times have granted charters to Colchester.

ON the Provan branch of the North British Railway, now under construction, there has just been accomplished a clever piece of engineering. The Provan branch leads to the new gasworks, and is nearly a mile in length, one-third of it being in tunnel. The tunnel forms a horseshoe, is on an eleven and seven chain compound curve, and was wholly driven from two shafts. So accurate was the setting out that on Saturday morning, nine months from the commencement of the work, the heading came through to a fraction of an inch. The engineers of the line are Messrs. Simpson & Wilson, and the contractors Messrs. Hugh Symington & Sons. The resident engineer is Mr. Charles M'Fadzean, and the contractors' engineer Mr. James Motion.

A TABLE which has just been prepared sets out the salaries of town clerks in a number of important boroughs in England, the figures given between parentheses below being the payment made to assistant town clerks where there are such appointments:—Bristol, 1,200*l*; Birkenhead, 1,800*l* (600*l*); Birmingham, 2,000*l* (600*l*); Bolton, 1,200*l* (400*l*); Bradford, 1,250*l* (600*l*); Brighton, 800*l* (600*l*); Cardiff, 1,250*l* (300*l*); Coventry, 1,000*l* (300*l*); Gateshead, 750*l*; Hull, 1,500*l*; Ipswich, 1,000*l*; Leeds, 1,750*l* (600*l*); Leicester, 1,500*l*; Liverpool, 2,000*l* (1,000*l*); Northampton, 700*l*; Nottingham, 1,100*l* (500*l*); Oldham, 800*l* (275*l*); Portsmouth, 700*l*; Preston, 1,000*l* (200*l*); Reading, 750*l* (325*l*); Rochdale, 500*l* (200*l*); Sheffield, 1,250*l* (600*l*); Southampton, 600*l* (250*l*); South Shields, 800*l*; Sunderland, 1,150*l* (250*l*); Swansea, 800*l* (300*l*); Wolverhampton, 900*l* (250*l*). In some boroughs other offices belong to the town clerks.

A SPECIAL meeting of the governors of the Gloucester Infirmary was held on the 19th ult., Colonel Curtis Hayward presiding, to discuss a recommendation of the sub-committee that various alterations be made to the infirmary. Mr. Waller explained that it was proposed to build a nurses' home in three sections. The chairman pointed out that thirty years ago a nursing staff of only 11 was found sufficient; now they required and had one which numbered thirty-four. Temporary provision had been made for their accommodation, but the time had now arrived when something of a permanent nature must be done. The estimated cost was 6,000*l*, which, however, did not include lighting, heating or furniture. Altogether they would require at least 10,000*l*. to meet the whole of the cost of

JAMES FREDERICK BURTON, Esq., Surrey Street.  
EDMUND FRANCIS BLAKE CHURCH, Esq., Bedford Row.

the proposed nurses' home. The question was as to how they should provide that money. If they took it out of their capital it meant a loss in annual income of 350*l.*, and that they could not do without reducing the number of their beds. They therefore favoured an appeal being made to the city and county to come to their assistance. After a long discussion the following motion was unanimously carried:—"That this meeting of governors adopts the report of the executive committee, and determines to carry out Mr. Waller's proposals as soon as possible; the meeting further determines that an appeal be made to the county and city and the public generally for the necessary funds."

At the committee-room in the Northampton Town Hall, Colonel W. Langton-Coke, one of the inspectors of the Local Government Board, held an inquiry into the application of the Northampton Town Council for permission to borrow a sum of 16,000*l.* for the erection of a refuse destructor and public baths on land situate between Bath Street and Castle Street. Mr. Hull, borough accountant, said the assessable value of the borough was 331,545*l.*, and the rateable value was 351,462*l.* The balance of loans under the Sanitary Acts and the Public Health Acts, including 20,000*l.* for street improvements, was 153,931*l.* Mr. Shoosmith said that the Town Council had been considering the difficult problem of getting rid of the rubbish of the town for some years, and of late they had made special inquiries into the matter. They had visited several towns and inspected the machinery and plant necessary to get rid of the ashes and rubbish, and had adopted a plan which they had seen at work at Blackburn. The site on which it was proposed to erect the works was a sort of desolate region, principally consisting of a large piece of ground which was of no use whatever, because it was too central to be worth much as garden ground, and a lot of dilapidated houses which the Corporation had succeeded in buying at a very reasonable figure. The Inspector said that the Local Government Board wanted to know what had become of the people who had left the houses, but the Town Clerk pointed out that it was impossible to tell, inasmuch as some of the houses were empty for twelve months before they were purchased by the Town Council, but particulars, so far as they could be ascertained, should be furnished. Only four houses were occupied when the purchase was made by the Town Council, and the occupants of those houses left voluntarily after the Council had completed the purchase. The remainder of the houses had, before purchase, been condemned under the Housing of the Working

Classes Act. Mr. Leask explained the plans. Mr. Gibbins produced the estimate, showing cost of land, 1,835*l.*; contract for destructor, 9,384*l.*; well, 200*l.*; slabmaking plant, 2,000*l.*; baths, 2,000*l.*; paving, &c., 130*l.*—a total of 15,549*l.*, the remainder of the 16,000*l.* being allowed for contingencies. The inspector subsequently proceeded to view the site.

## BUILDING AND BUILDERS.

MRS. ARTHUR PEASE, widow of a former member of Darlington, has offered to build and endow a church in the outlying district near the waterworks and Low Coniscliffe and Tees Grange, Darlington. Mr. Arthur Pease lived in the locality, and formerly himself conducted a service in the schoolroom at Low Coniscliffe, there being no church in the locality. The new church, which will form a chapel-of-ease to Holy Trinity, Darlington, will, it is understood, with the cost of buildings and endowment for a curate, cost 10,000*l.*

SOME excitement has been occasioned in the Bristol building trade by the Master Builders' Association giving six months' notice to reduce the wages of all employes by one penny per hour. Slackness of trade and the overflow of the labour market are assigned as the reasons, there being more men out of work than for several years past. The war has seriously affected trade, and the enhanced cost of labour and material has checked building enterprise. At present skilled workmen are receiving 9*d.* per hour, averaging 2*l.* per week, and the proposed reduction represents 4*s.* weekly. The builders' labourers, earning about 27*s.*, will suffer more seriously than the mechanics by the threatened reduction, which is viewed with dismay.

MR. C. H. WILSON, M.P., takes a deep interest in the question of housing working men, and he has for some time past been engaged in the promotion of a scheme for the erection of homes for working men in the new Great Passage Street, Hull. Three blocks of buildings will be erected, to be known as the Victoria Mansions. The capital of the company is 30,000*l.*, in 3,000 shares of 10*l.* each, of which it is now proposed to call up 5*l.* The cost of the mansions will be about 26,000*l.*, and accommodation will be provided for 400 men, there being this number of cubicles, with a dining-room, smoking and reading-rooms.

TO THE MANY THOUSANDS of Householders, Proprietors of Hotels, Clubs, &c., who have occasion to partially refurnish their Residences for the coming Coronation Season, with a view to either occupying or letting same, and to all who purpose making Furnishing Purchases,

# HAMPTONS GREAT ANNUAL STOCKTAKING CLEARANCE,

**THIS DAY and until the 25th inst. ONLY,**  
Affords an Invaluable Opportunity to secure every description of House Furnishings of the Highest Class at CLEARANCE PRICES.

For full details of these Bargains see Hampton & Sons' Special Illustrated Clearance Catalogue, now ready, sent post free on application. In addition to the Great Reductions on all the Stock Sideboards, Cabinets, Easy Chairs, Screens, Antiques, China, Glass, Ironmongery, &c., &c., that are included in this Clearance, as specified in Special Catalogue (q.v.), this clearance will also include:—

(a) Enormous Shipments (consisting of over 700 Carpets) of Real Turkey, Persian, and Indian Carpets, at 25 to 35 per cent. less than to-day's London Competitive Prices. (See Clearance Catalogue, pages 18, 19, 20, and 21.)

(b) Two Manufacturers' Stocks of English-made Axminster Carpets by the yard—one Stock at 33½ per cent. less than to-day's London Competitive Prices; another Stock at 25 per cent. less than to-day's London Competitive Prices. (See Clearance Catalogue, pages 12 and 16.)

(c) A Manufacturer's Stock of Choice English-made Seamless Axminster Carpets at 25 per cent. less than to-day's London Competitive Prices. (See Clearance Catalogue, pages 12 and 15.)

(d) A Manufacturer's Stock of all-Wool Bedroom Carpets at 30 per cent. less than to-day's London Competitive Prices. (See Clearance Catalogue, page 14.)

### ALSO MANUFACTURERS' STOCKS OF

### BRITISH-MADE TAFFETAS and TAPESTRIES

AT LESS THAN HALF PRICE.

(See Clearance Catalogue, pp. 22 and 23.)

### CURTAINS and CRETONNES

LESS THAN HALF COST PRICE.

### TABLE DAMASK and HOUSEHOLD LINEN

WHICH WILL BE CLEARED AT

(See Clearance Catalogue, pp. 24 and 25.)

HALF PRICE.

### Also Immense Stocks of LACE CURTAINS

At 40 per Cent. to 50 per Cent. Reduction. (See Clearance Catalogue, p. 26.)

Doors open 9 to 6.30. Saturdays till 2 p.m.

**HAMPTONS,** Pall Mall East, Trafalgar Square, S.W.

A SCHEME is being formulated at Dowsby, South Lincolnshire, for the better drainage of the fens of that parish and Aslackby, which seriously suffer from flood water in times of heavy rain. The idea is to amalgamate the two fens, which adjoin each other, and to control the scheme by a drainage board under one management. The proposed system of drainage is by means of engines and pump, and the cost is estimated at about 17. per acre. In a circular letter issued to the landowners of the two parishes, it is stated that the land cannot now be put to the best advantage owing to the risk of flooding, and it is believed that if the idea is carried out all this would be obviated, and that the selling value of the land would be increased by 8. or 10. an acre.

A MEMORIAL-STONE was laid on the 27th ult. in the Nautical College in course of erection in Commercial Street, Leith. This college will be the first in Scotland to be specially constructed for, and wholly devoted to, the purposes of nautical education, and is being erected at a cost of 3,000. It is situated close to the dock gate opening on to the west pier, and is on ground granted by the Dock Commission, with a frontage to Commercial Street of about 50 feet. The building will consist of three storeys. On the ground floor there will be a library, instrument-room and nautical-experiment room. The first floor will be divided into classrooms by means of sliding partitions, and can be converted into one large lecture hall. Above the attics a tower will be constructed for the purpose of taking astronomical observations. The building will be heated from the basement, and will be fitted up with electric light.

THE Town Council of Linlithgow have accepted the offer of Messrs Blair & Whyte, contractors, Glasgow, for the construction of the sewage disposal works which are part of the drainage scheme for the burgh. The works are to be carried out on one of the biological systems, and are to be constructed on a site extending to about 4 acres, situated at Joustinghaugh, about half a mile to the north-west of the town. The tank is to be in two divisions, so that, if necessary, one can be thrown out of operation for cleansing or repair while the other is keeping the contact-beds supplied. The tank effluent will then be dealt with in a series of six to eight contact-beds, on to which it will be delivered by spraying. A portion of the ground acquired for the works consists of open porous beds of sand and gravel, with an admixture of soil, and can, at a comparatively small outlay, be converted into land filters, which will take the effluent from the contact-beds, and so complete the

final stage of the purification of the sewage before the effluent passes into the stream adjoining. The sewers in connection with the scheme have for the most part been already laid, and the disposal works are to commence immediately. There is a prospect of the entire scheme being completed by the end of next summer, when the objection on the part of summer visitors and residents alike to Linlithgow's beautiful loch being used as the cesspool of the burgh will be removed. The contract for the laying of the sewers is also in the hands of Messrs. Blair & Whyte, whose total estimate for both branches of the scheme amounts to 9,700. being 5,420. for the laying of the sewers and 4,280. for the disposal works. The engineers engaged in connection with the scheme are Messrs. Warren & Stuart, Glasgow.

At last week's meeting of the Dudley Board of Guardians, Mr. J. T. Homer presiding, the building committee recommended the acceptance of plans prepared by Mr. Marshall, architect, Nottingham, for the erection of a new laundry at the workhouse capable of meeting the requirements of 1,000 persons, provision to be made for a boiler-house, stack, engine-house, &c., and that Mr. Marshall be instructed to carry out the work. In moving the adoption of the report, Mr. Mantle remarked that the Board having rejected what had been called "the 20,000. scheme," and confirmed the appointment of Mr. Marshall as architect, it became necessary for the committee to consider a fresh scheme. Mr. Marshall had accordingly submitted new plans for the erection of an infirmary, administrative block and laundry, including boiler and engine-house, &c., at a total cost of 25,000. The committee, after carefully considering the matter, decided to only adopt that part of the scheme relating to the laundry. The plan of the laundry building submitted by the architect provided for the requirements of 1,100 persons, but the committee considered that as 900 was the largest number of inmates that had yet been in the house at one time, it would only be necessary to make provision for 1,000, which would reduce the estimated cost of this building from 4,500. to 4,100. The total estimated cost of the new laundry scheme was 8,450., including 4,100. for the laundry building, 3,000. for the boiler-house, stack and engine-house, and 1,350. for the machinery, electric motor, &c. Deducting this from the total of 25,000. made the estimated cost of the infirmary 16,550., which, in the event of provision being made for 180 beds, would represent an average cost of about 92. per bed. The chairman seconded the resolution, which was adopted.

DIARIES AND CALENDARS FOR 1902

THE City Diary (W. H. & L. Collingridge & Co.) has now reached its thirty-ninth year of publication, and still retains its pristine vigour. It contains as usual a complete list of the names and addresses of the Corporation. Full particulars of the City guilds and companies, clergy and ministers and their churches and chapels, hospitals, asylums, schools, clubs, &c., are given, while the diary portion, which is interleaved with blotting-paper, allows ample space for notes.

WE have received from the Electrical Power Storage Company an excellent combined calendar, diary and desk blotting-pad. It is very handsomely got up and its large size renders it a valuable adjunct to the writing-table. The highly ornate tear-off calendar issued by the Rugby Portland Cement Company will be welcomed in many an office, while Messrs. Douglas Young & Co., Bradbury, Agnew & Co., Spottiswoode & Co., Ltd., John M. Henderson & Co. and the Sun Insurance Office each send useful and ornamental specimens of hanging calendars, supplemented in the case of the last named by a handy blotting-case and an elegant little pocket calendar, decorated with a reproduction in colour of the picture in the Royal Exchange of the Fire of London, by Stanhope A. Forbes, A.R.A.

FROM Messrs. Robert Boyle & Son, Limited, of 64 Holborn Viaduct, we have received an elegant little celuloid pocket tablet in case, having on the obverse a calendar in gold and on the reverse a three-inch measure and one marked according to metrical measurement.

A YEAR'S BUILDING IN THE NORTH.

IF the reports on the year's building which reach us from Scotland and the North can scarcely be regarded as enthusiastic, it must nevertheless be admitted that they could well have been less satisfactory, and that on the whole some good work has been completed or is in hand.

The least satisfactory account comes from Edinburgh, where we are told that notwithstanding that there was a falling off in the value of work passing through the Dean of Guild Court in 1900, amounting to 347,317*l.* less than the previous year, it is again to be recorded that the year now ended

shows a further decrease of 199,610*l.* From the statistics of the Dean of Guild Court for 1900 the number of warrants granted, including minor warrants, reached the total of 884, of an approximate value of 829,950*l.* These warrants referred to 57 villas, 74 self-contained houses, 225 public and other buildings, 590 alterations, and 82 tenements, containing 43 shops and 962 dwelling-houses. Last year the work passed through the Court represented 782 warrants, of an approximate value of 630,340*l.* These warrants embrace 36 villas, 126 self-contained houses, 148 public buildings, 398 alterations, 56 tenements of 15 shops and 537 dwelling-houses. There has thus been a considerable diminution on all classes of buildings during the year, with the exception of self-contained houses. About 57 per cent of the tenements passed during the year still remain to be built, and a number of the buildings erected during the year form part of warrants granted during the two previous years. It is expected, however, that as there is now a time limit to the duration of the warrants a number of buildings will be proceeded with during the ensuing year. It is evident from the increase of self-contained houses that they are more in demand than houses in tenement property. Public and other buildings, more than any other for some time past, have received considerable attention, notably the Caledonian Railway Hotel, the North British Railway Hotel and the *Scotsman* Office buildings, the Municipal Buildings, additions to the Register House, Merchant Company premises, Rose Street; Macvitties, Guest & Co's premises, Rose Street; M'Vittie, Guest & Co's premises, Princes Street; Mackie's premises, Princes Street; new premises to be used for postal purposes, Frederick Street; Royal Insurance premises, St. Andrew Square; large addition to Heriot-Watt College, the reconstruction scheme of the United Free Church Assembly Halls, additions to Royal Infirmary, large and commodious premises at Tollcross for Players' Riding School, new Commercial Bank at corner of Queensferry Street and Shandwick Place, and the Wesleyan Methodist Mission Hall at Tollcross. The St. Cuthbert's Co-operative Association are erecting large new business premises in rear of their present property, and this same body have another very large building scheme on hand in another part of the town. Continuing public buildings in the Merchiston and Slateford district, the largest contract is for the North British Rubber Company, Gilmore Park, on the east and west side, where opportunity has been taken of making a considerable widening of the street. Large additions have been made to M'Ewan's Brewery, Fountainbridge. There has

also been an addition of considerable magnitude to the North British Distillery at Slateford, and an important piece of ground has been acquired for a further extension at no distant date. In the northern district one or two schemes of note have been carried out, as the widening of Stockbridge Bridge, the erection of the Tivoli Theatre in St. Stephen Street, the McDonald Road Library, extensive business premises in Hamilton Place, Wariston Road, Abbeyhill, Moray Park, Easter Road and London Road. The bonded stores at St. Leonard's, recently destroyed by fire, are being reconstructed on a very much more extensive scale as a building of Scottish Baronial character, while a large addition is also being made to St. Leonard's Brewery. Neither educational nor ecclesiastical buildings have been wanting. While the new United Free church at Gorgie and St. Stephen's United Free church have been opened during the year, there is in course of erection at the present time for the Established Church denomination a new church for the Dean parish, also a new church at the foot of Dalkeith Road for the Prestonfield congregation. Large additions are in progress to Merchiston Castle school, and also to the Episcopal College in Orwell Place. During the year three new schools have been erected, viz. New Street, Parson's Green, "Flora Stevenson," Comely Bank, while in Ashley Terrace, for the Merchiston district, a new school will shortly be fully equipped. Workrooms, laboratories and cooking classrooms are being attached to many of the existing schools throughout the city. The Lord Provost and magistrates have been mindful of the housing of the working classes, no fewer than 196 houses having been erected, situate in West Port, 61; Bedford Crescent, 20; Dean Street, 18; Potterrow, 31; Pipe Street, 66. The St. Giles's Dwelling-House Association, Limited, having acquired the old property in Grange Court, Causewayside, are at present reconstructing the whole premises, which, when finished, will provide thirty-seven houses.

From Leith, too, we learn that the building trade during 1901 has not been so brisk as in former years. The prices of building materials reached such a height that the erection of new property, especially tenements by speculative builders, was considerably checked, and though prices have now fallen, this branch of the trade will take some time to recover. The erection of villas in the Trinity district has continued steadily throughout the year. The directors of Leith Hospital have erected in King Street a home and laundry for the accommodation of the nursing staff of the hospital, and where the

laundrywork in connection with that institution can be done also. The existing building and the new home are connected by a subway which runs under King Street. There is also in course of erection, in Commercial Street, the Leith Nautical College, the memorial-stone of which was laid on the 27th ult., and the old Seafield baths are being converted into workmen's houses by ex-Provost Aitken. On Trinity Hospital ground at Easter Road a large envelope and paper-shaving factory is in course of erection, adjoining which Messrs. Younger & Co. are building large maltings. In the same district cooperages are being erected by Messrs. Dryburgh, and opposite Lorne Street, and between Lorne Street and Thorntree Street, tenements are being erected, so that the large area between Quarryholes Cottage and the Cork Factory will be well taken up with buildings in a year or two.

In Portobello district, a little more activity is to be noted than last year, partly in consequence of the extended boundary to the south, where for some years past the tendency for villa residences has been noticeable. In all some ten villas have passed the Dean of Guild Court. Some have been completed, and others are still in progress. A large addition to Duddingston Road school has been carried out during the year. In Argyle Crescent five villas have been completed, and three are in operation. In Bailliefield Road, at the corner of Fishwives' Causeway, plans have been approved by the Dean of Guild Court for the erection of six workmen's cottages. Two villas are in course of erection in Portobello on Craigen-tinny estate, between the home farm and Wheatfield; three tenements were passed to be erected in King's Road. Only one of these has been erected. An additional storey is in course of erection to the Royal Hotel, in order to supply the growing demands for bedroom accommodation. A landmark has been removed in George IV. Bridge by the demolition of the County Buildings, to make room for the new and more commodious premises required for county administrative work.

From Glasgow the news is more favourable, the various trades connected with the building industry in this district being described as in a very satisfactory condition. It will be remembered that early in the year the operatives connected with one of these trades submitted gracefully to a small reduction in their standard wage. Those connected with another resisted a demand made by their employers for a slight reduction, which caused a cessation of labour to some extent for some weeks in that trade. But as a large number of the employers had contracts which had to be completed to enable

the premises to be occupied at the term of Whitsunday, and as the Exhibition buildings were in the hands of a large number of the operatives of that trade, a cessation of labour at which could not be thought of at the time, the result was that the short struggle terminated in a nominal victory at least for the operatives, although reductions in many instances have since taken place, and the standard rate in the trade is not altered. During the past year there has not been so much dwelling-house property of the tenement class built as there was for some years previous, but a considerable amount of villa and cottage property has been built in several of the suburbs, which has been well taken up, and in many cases has changed ownership at remunerative prices to the builder, notwithstanding the high prices paid for building materials, and there are good prospects of the demand for this class of property continuing for some time yet. In the period a considerable amount of warehouse and office property has also been erected, but there are ominous indications that the supply of this class of property is at present somewhat in advance of the demand, notwithstanding there are some important contracts in preparation. The railway extensions which have been in progress for the last two years, and are still going on, have had a good effect in keeping the operatives employed, and these are by no means exhausted yet, but will employ a large number throughout the present year. The Corporation as improvement trustees have also some large contracts in preparation as well as in progress, and all things considered, those engaged in those trades may look forward with hope as well as back with pleasure.

An unusual number of buildings of a public or semi-public character are at present in course of erection or have just been completed in the burgh of Ayr. Chief among these is the new town-hall, which is being reconstructed on the old site from designs by Mr. J. K. Hunter, architect, Ayr, at a cost of about 10,000*l*. A new theatre, the first real theatre that has ever been in Ayr, with all modern improvements, is being erected for a company on the site of a previous wooden structure in Carrick Street by Mr. J. McHardy Young, architect, Ayr, at a cost of over 7,000*l*. The structure is of red brick, and it has been set back with a view to the eventual widening of the whole street. A new drill hall and headquarters for the 2nd Volunteer Battalion Royal Scots Fusiliers has been commenced at the south end of Alloway Street from designs by Mr. James A. Morris, architect, Ayr. The drill hall, when completed, will be 96 feet by 50 feet, and will be the largest hall in Ayr. The

structure includes an armoury for 300 rifles, a gymnasium, a reading-room, a billiard-room, an officers' mess-room, a sergeants' mess-room, ladies' and gentlemen's cloak-rooms, artists' room and platform. A very handsome block of buildings is being erected in High Street for the British Linen Banking Company, whose present premises are in Newmarket Street. The building occupies a site nearly opposite the Union Bank of Scotland. A large addition to the Ayr Corporation electric-light and electric tramways station in Mill Street is nearing completion. This includes a large suite of offices and committee-rooms, while the accommodation for engines and boilers has been doubled. A large new church is being built in Midton Road, to be known as Trinity United Free church, for a congregation who have been for some years worshipping in a hall on the same site. The hall will form part of the church buildings. The Glasgow and South-Western Railway Company have in hand in the vicinity of Newton-on-Ayr station the installation of a complete set of plant for the manufacture of oil gas for the lighting of their railway carriages, to obviate the necessity of having to supply the light from Glasgow. The buildings have been completed, and the erection of the machinery and plant nearly so. The new iron railway bridge for the same company across the upper end of Ayr harbour, and giving access to the south side of the harbour and the Ayr shipyard is being finished, and will soon be ready for traffic. A large new shoe factory for Mr. Andrew Greenlees, Maybole, has been erected in the neighbourhood of Newton-on-Ayr station, and is now in operation. In addition to these, a large number of dwelling-houses, comprising villas and blocks of superior workmen's dwellings, are being erected in all parts of the town, where there is vacant ground, and especially in the Craigie district.

In Leeds the building trade has been fairly active—thanks largely to the extensive operations in and around Briggate, which are gradually transforming this well-known street into something architecturally presentable. Among the contracts recently completed are the County Arcade and thirty-five shops in Queen Victoria Street, while on the opposite side of Briggate a new street is about to be made. Among public buildings being re-erected are the School of Art and the Women and Children's Hospital. Another large undertaking is the building of the new Roman Catholic Cathedral in Cookridge Street, just beyond the present cathedral at the top of Park Row, which has been purchased by the Corporation, and is to be demolished in order to do away

## ARCHITECTURAL WORK A SPÉCIALITÉ.

**IMPORTANT.**

with an awkward curve in the tram route at the junction of the two streets. The speculative builder has hardly been quite so active during the past twelve months as in some recent years, the number of houses erected—about 2,000—being considerably less than in the year before. With regard to the sudden rise of scores of handsome shops in parts of the city which have hitherto been regarded as lying just outside the rather narrow shopping area, considerable curiosity exists as to whether it may not be found that there has been some unwise speculation.

Quietude has characterised the trade in Halifax throughout the year, but still things have been a little more brisk than in 1900 in regard to cottage property. Very few workshops or factories have been built these last two or three years, but house property will have to remain quiet for some time yet unless it is built in really good positions. There is a great number of houses to let just now in the town. Competition is very keen in this district, where work is to let by tender, which is a proof that the building trade is bad, and there is not much prospect of it being better for a little time. Building materials, such as stone and some kinds of wood, are a little cheaper, but other materials are about the same. The principal works now in progress are the following:—Additions to tram dépôt; Board schools in Battinson Road and Haugh Shaw; houses on the Mayfield Estate, in Victor Terrace, Rothwell Road, Wyvern Place, Albert Road, Spring Hall Lane, Greenroyd, and at King Cross, Wheatley, Trimmingham, &c. There seems to be a feeling abroad that the Corporation will have to considerably modify the by laws with regard to cottage building before much more house property is erected.

In Bolton, if not quite so numerous as in 1900, the number of buildings erected during the past year is by no means discouraging, and that of the mills which have been erected, or are nearing completion, with the numerous extensions to existing factories and warehouses, implies a healthy state of affairs in the local textile world. One feature of the year's building operations is the amount of work executed or in course of execution for the various religious denominations in the town. The new church of SS. Simon and Jude has been completed and consecrated, the Victoria Wesleyan church schools in Grecian Crescent have been transformed, a new place of worship is being erected in Beverley Road for the Independent Methodists, and a new Wesleyan church in Chorley New Road is contemplated. Messrs. Potts, Son & Hennings are responsible for designs of many churches, &c., including the new Independent

Methodist church and schools, in Beverley Road, Bolton, for the trustees. The church will hold about 400 persons and the schools about 500 scholars, the cost of both church and schools being about 4,000*l.* The contract has been let to Messrs. Atherton & Norris, builders, Bolton. The new day and Sunday schools for the Victoria Wesleyan church, Grecian Crescent, two storeys high, will accommodate 854 scholars for day school purposes. The cost will be about 6,000*l.* The work has been entrusted to Messrs. W. Townson & Sons, Ltd. Plans for a new Wesleyan church situated on Chorley Old Road, adjoining present schools, have been prepared. The seating accommodation will be 650, and the cost about 5,500*l.* A large proportion of the architectural work of Mr. John Ormrod, has been executed out of town—at St. Annes-on-Sea and near Prescott. Buildings in Bolton district comprise the following:—Extensive additions to Messrs. Hodgkinson & Gillibrand's hosiery works, whereby the capacity of the works has been almost doubled. The Park Mill Spinning Company have raised their No. 1 mill one storey, making this five storeys in height; a large water tower has also been built over a portion of No. 2 mill in Gaskell Street, whilst a four-storey warehouse is now in course of erection, &c. Messrs. John Morris & Son have designed for the Bolton Corporation tramways committee new car shed, waiting-room and caretaker's house, Chorley New Road, Horwich, which was completed last July. It is a large and handsome block of buildings, and the shed will accommodate eight cars. The waiting-room adjoining is well lighted and fitted with seating all round. The inspector's house communicates with the waiting-room and faces Chorley New Road. Amongst the work in hand or completed during 1901 by Mr. R. Knill Freeman, diocesan surveyor, Bolton and Manchester, is the new church and schools of St. Simon and St. Jude, Great Lever. The schools were completed in 1900, and were opened early in the past year, and the church is now completed, and was consecrated on November 5 by the Bishop of Manchester. The accommodation provided is for between 600 and 700. The church and schools group well together, and provide ample accommodation for the spiritual wants of the neighbourhood. The completion of the Corporation Baths, High Street, has from various causes been delayed, but recently more rapid and satisfactory progress has been made. They will be opened to the public early in the present year, and when completed will provide full and up-to-date accommodation for the district in which it is placed. Other works by

London Showrooms—57 HOLBORN VIADUCT, E.C.

To be obtained through Hardware Merchants, Factors, or Wholesale Ironmongers, through whom our Catalogue of General Brassfoundry may also be obtained.

Mr. Freeman comprise alterations and additions to St. Stephen's and All Martyrs schools, Lever Bridge; a new cookery school in connection with Markland Hall school; parish schools, Farnworth; St. Matthew's schools, Little Lever, &c.

To some of the important business concerns in the district additions have been made by Messrs. Bradshaw & Gass Messrs. T. M. Hesketh & Son, Ltd.; Messrs. John Harwood & Son; Messrs. Walter Mather & Co., Ltd.; Messrs. Ormrod, Hardcastle & Co., Ltd., and other business firms have had building done, and Messrs. Robt. Entwistle & Co., Ltd., have much extended their weaving shed and built additional warehouses. Mills, &c., have been erected at Oswaldtwistle, at Stalybridge and at Leigh. Other manufacturing concerns in the Bolton neighbourhood have also made extensions. At the Corn Mill, Spa Road, Messrs. John Jackson & Son are building a large new warehouse, and Messrs. Fletcher, Burrows & Co.'s new coal offices, stables, &c., in Dawes Street have been completed. Among the shop premises of which Messrs. Bradshaw & Gass have been architects are the large extensions of Messrs. Constantine Bros., Deansgate and Bridge Street, the size being practically doubled. In Bradshawgate, Mr. Jonas Proctor has erected new shops and offices on the site of the old district bank. In domestic work additions have been made to several houses. Brierfield, Sharples, the residence of Messrs. Herbert & Walter Mather, is being much enlarged; and at Vale Bank, in the Haulgh, Mr. Thomas Fallows has had enlargements and alterations; whilst at the Beeches, in the Haulgh, Mr. A. Greenhalgh has built an exceptionally fine music-room, and has probably the largest private organ in the district. At Turton Mr. Waddicor has built a new residence and the warehouse for Messrs. Waddicor & Co. has been completed.

### BIRMINGHAM IN LONDON.

NOT many years have elapsed since Holborn presented so dull an appearance as to justify Charles Dickens when he fancied a megatherium or other ancient beast waddling up Holborn Hill. The hill has vanished, and with the Viaduct which took its place a new spirit seems to have come into what was a long unlovely street. It is now as varied in its architecture as any other great thoroughfare, and, what is more remarkable to those who were acquainted with Holborn in the old days, every shop-window endeavours to display goods to the greatest

advantage. The extent of the innovation can be judged by a few survivals which recall the time when Holborn lived by permanent customers, and was indifferent to those who could be attracted suddenly by some article which met their gaze.

In No. 54 High Holborn we have a building which unites past and present. Standing nearly opposite Chancery Lane, it is in the most frequented part of the thoroughfare, but in the two great windows there is nothing to draw the attention of those who pass by. It might be a bank or an assayer's laboratory, an insurance office or a sharebroker's on a large scale. But from its plainness and indifference to external adornment it must have secured attention from students of what may be called the physiognomy of London buildings. The only indication of its purpose is the inscription over the doorway, "Nettlefold & Sons." The observer may say to himself, "Screws!" and wonder, if he is not engaged in construction, why so simple an article should have a building with so large a frontage devoted to it.

England is the country of specialists, and those who are fortunate in gaining an association of their name with any kind of production have to pay the penalty imposed by the law of compensation of being supposed capable of producing nothing else. Screws, no doubt, are an important item in the business of the universally known Nettlefolds, but as we shall see there is much else to be found at No. 54 High Holborn of a different class. It is a conventional description of a well-filled ironmonger's shop to say that everything from a needle to an anchor can be found in it. But the variety of metalwork, and especially of general and builder's ironmongery, is so multifarious in No. 54 that the premises can be characterised without exaggeration as Birmingham in London. Nowhere else to our knowledge is so vast a collection to be found of Birmingham productions of the best class. There may not be work in the precious metals, including jewellery, but in much of the brasswork we can see the qualities of design which are to be found in more expensive articles. It should also be clearly understood that the art is not that which was once known as "Brummagem." The people in the Midland capital have realised that if they are to hold a position in the markets of the world they must compete with Germans, Frenchmen and Americans not only in cheapness, but in beauty of forms and surface decoration. The success which has been attained since the emancipation of the schools from South Kensington influences is exemplified in many of the cases which are to be seen in the Holborn house of the Nettlefolds.

## WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light, and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

TECTURAL CASTINGS.

**WILSON & CO.**  
24 HARRISON STREET,  
GRAY'S INN ROAD,  
LONDON, E.C.

As we have remarked, the exterior of the building is unpretentious, but the extent of the premises is surprising for London. Without a large area it would be impossible to arrange articles which to the stranger appear to be countless in their variety. The highest quality of method is supposed to be exemplified in having things in their proper places, and a student of philosophy would find a practical illustration of Coleridge's definition by a walk through the various departments. There is one catalogue, for instance, which contains over 9,000 items. Each of these has some peculiarity which claims attention, and each has its local habitation and its name. Now, if we multiply those articles by the dozen or by the gross we may obtain some notion of the system which must preside over the everyday business that has to be carried on in the various departments. To those who pass in front of the building, and to the practical purchasers who do not expect to be delayed a minute before obtaining what they require, Nettlefolds may appear as only a shop, but it should be regarded as an emporium in which everything that is most useful or most pleasing in builder's ironwork is represented, and all who may be desirous of specifying or ordering the latest products in various classes can satisfy themselves by a reference to the contents of the cases. Nettlefolds, in fact, can be compared with the London Directory, an encyclopædia, or one of the great dictionaries, as a treasury which can be consulted with the conviction of finding whatever is sought and in the best form.

With so large an area to deal with, top-lighting has to be adopted. It has the advantage of allowing of the arrangement of divisions relating to different classes of work. A visitor who is pressed for time has only to mention his requirements and he can be at once conducted to the room where the articles he requires are exhibited. For instance, lock plates, knockers, bell levers and ornamental door furniture of many forms can be compared almost at a glance and a selection made with the utmost facility. The only drawback is that where so much which is well made and well formed is placed before the eye, choosing sometimes becomes a difficult operation. People who imagine that it is necessary to employ a "craftsman" in order to obtain a beautiful example of brass-work on a small scale will be disillusioned, for much of what is to be seen is of a character that would command a place in any exhibition of metalwork.

There is, as we have said, a profusion of all classes of goods which are comprised under the familiar head of "builders'

ironmongery." Patented inventions abound, such as sash-fasteners, blind furniture, spring hinges (of which the "New Idea" is a noteworthy example), draught excluders, floor springs, door springs, fanlight openers, panic bolts, locks of all sizes and descriptions, American as well as English, latches, ventilators, &c. One room is assigned to "black goods," which in a builder's eyes are of great importance. Both cast-iron and malleable cast goods are available. Sanitary ware, baths and all appliances conducive to health can also be examined. Then there are builders' tools, forge fittings, &c. In fact, Nettlefolds can supply aids for all the stages of building construction, as well as the articles in metal which are necessary to insure pleasing and satisfactory buildings. The premises form an industrial museum in which modern work of the best classes is brought together. The name of the firm is a guarantee of the quality of their own manufactures, but after going through the departments in No. 54 High Holborn the visitor will conclude it is no less a guarantee of whatever is selected, and the appearance of another manufacturer's goods anywhere on the premises is to be taken as evidence of excellence and fitness for use. For that reason architects and builders, by visiting Messrs Nettlefolds' London building, can be saved the loss of time and trouble often involved in the search for appliances which hitherto were only to be seen far apart in London. For in Holborn they will be found to be brought together, and can be inspected with as much convenience as if they were collections in an industrial museum.

This firm has lately introduced several novel lines in door furniture of Japanese design, make and finish, and those who know how our friends of the Far East turn out their goods will not be surprised when these are described as something unique and beautiful.

#### A NEW TIDAL WEIR AT GLASGOW.

THE tidal weir on the Clyde at Glasgow Green, the construction of which has occupied a period of close upon, if not quite, seven years, has now been completed, and its formal inauguration took place on Saturday last, the ceremony being attended by a large number of members of the Corporation and representatives of the Clyde Trust and other public bodies. Precisely at noon, in extremely inclement weather, Lord Provost Chisholm lowered the sluices and formally declared the weir open. The structure is the fourth which has been erected on

SOLE AGENT FOR UNITED KINGDOM.

SUB-AGENTS OR TRAVELLERS REQUIRED THROUGHOUT THE UNITED KINGDOM.

the river for the control of the up-stream waters, its predecessors, each of which was in turn removed, being situated respectively on the west side of Jamaica Bridge, at the old bridge at Stockwell Street, and about 140 yards above Hutesontown Bridge. The last of these was demolished in 1884 under the idea that its removal would facilitate operations in the river, and would result in at least a diminution of the dredging necessary. The step, however, resulted instead in disaster, great and costly inroads taking place upon the banks of the river, and serious injury to the navigation arising from delay of the tide, formerly impounded by the weir, passing without interruption into the higher reaches of the river, and the enormous quantity of material from the bed and banks of the river which was carried down into the harbour. These considerations, among others, induced the Corporation in 1894 to obtain an Act of Parliament to empower the re-erection of the weir on its former site, but on a different design, the distinctive principle of which is the removable character of the three ponderous gates that form the dam. These travel in delicately adjusted guides on roller bearings, under the control of equipoises, which enable each gate to be moved with perfect facility, a mechanical arrangement which was the invention of the late Mr. F. G. M. Stoney, M.Inst.C.E., of the firm of Messrs. Ransomes & Rapier, Ltd., Ipswich and London, the contractors for the superstructure and the working parts of the weir. The original arrangement between the Corporation and Messrs. Ransomes & Rapier was that the construction of the weir should be carried on in cofferdams, in the same manner as had been adopted in erecting a similar weir on the river Thames at Richmond, and a commencement was made in this manner, but the first cofferdam was wrecked by an exceedingly high flood on December 5, 1895, and the condition of the bed of the river was so seriously changed by the down-rush of 11 feet of storm-water, travelling at a velocity of eight miles an hour, that it was resolved by the Corporation, after consulting with Sir Benjamin Baker and Messrs. Ransomes & Rapier, Ltd., to adopt another method of construction for the foundations and piers of the weir. In accordance with the new plan suggested by Sir Benjamin Baker, a curtain wall of concrete enclosed in steel caissons has been constructed under pneumatic pressure across the whole width of the river, to provide a secure rest for the abutments, piers and sill of the weir. This curtain wall, 30 feet in depth, has been with great difficulty carried down through the foundations of the old weir. The work occupied

of necessity a very long time, but it was eventually accomplished in the most satisfactory manner, each separate caisson being tested in position by a load of 1,400 tons of iron before the erection of masonry was commenced, so as to insure beyond possibility of doubt that no movement of the superstructure could hereafter take place. This part of the work was carried out by Messrs. Morrison & Mason. The motive power for raising and lowering the sluices is supplied by hydraulic energy from the Corporation supply. It is expected that the effect of the weir will be the maintenance of continuous high water in the upper reaches of the river, as it is not intended to raise the sluices during the ebb tide unless an undue volume of flood water renders that action necessary. In addition the restoration of the stability which the new weir provides is expected to arrest the decay of the river margins, and reduce the expenditure that would otherwise be needed for their preservation. A separate result will be the restoration of the opportunity for boating. Much advantage it is further anticipated will accrue to navigation on the river, the loss to vessels of a foot of depth all the way to Greenock, which has existed for the past fifteen years, being now removed. The cost of the weir was estimated at 45,000*l.*, but this sum has been very considerably exceeded.

### NEW ACADEMY AT IRVINE.

A NEW Academy which will prove an important addition to the educational resources of Irvine, N.B., was opened by the Earl and Countess of Eglinton on the 27th ult. This building, which has been erected by the Burgh School Board at a cost of about 13,000*l.* or 14,000*l.*, occupies the site Irvine's old Academy formerly stood on at the south end of Irvine Moor, and is one of the most completely furnished educational institutions in the West of Scotland. On approaching it from the north one cannot help noting the imposing appearance and massive look the building possesses, as it seems to guard the town moor and to give a finish to this long stretch of level green with its walls of red Ballochmyle sandstone. It is much higher and larger than the old building, but at the same time bears a resemblance to it in outward form. In the interior the school has been designed on the corridor system, so as to give the maximum amount of teaching space, and everything possible has been done to secure the comfort of pupils. So far as classrooms go,

the school has roughly been divided into two sections, those on the lower floor being devoted to the teaching of ordinary subjects, while the upper storey has been furnished in a most complete manner for the conducting of technical and higher branches of study. The building has been constructed after the Grecian style of architecture, and great care has been taken to secure as much light as possible, and, where possible, to secure that light from the side rather than from the back or front. Amongst the special features possessed by the school must be included the gymnasium and workshops, which form a separate building on the site of the old archery butts, and which, like the other departments, are fitted up in the most complete manner.

### ELECTRIC LIGHT AT MAIDSTONE.

MAIDSTONE wore an unwonted air of brightness on the evening of the 19th ult., when the electric light, which has been installed in accordance with a scheme devised by Messrs. Stevens and Barker, was switched on by Mrs. Edmund Morgan, the wife of the deputy-mayor, who is chairman of the electric-light committee. The cost of the installation, which has been excellently carried out, amounts to some 40,000*l*. The contractors for the various sections of the work were as follows:—Buildings and shaft, Messrs. G. E. Wallis & Sons, Maidstone; steam dynamos, balances and boosters, Messrs. Thomas Parker, Ltd., Wolverhampton (Messrs. Davey, Paxman & Co., Ltd., Colchester, sub-contractors for engines); boilers, Messrs. Davey, Paxman & Co., Ltd.; surface condenser, Messrs. Cole, Marchant & Morley, Ltd., Bradford; switchboard, Messrs. Kelvin & James White, Ltd., Glasgow; storage battery, the Chloride Electrical Storage Syndicate, Ltd., Manchester; travelling crane, Messrs. Carrick & Ritchie, Edinburgh; underground mains and arc lamps and posts, Callender's Cable and Construction Co., Ltd., Erith; pipework, Messrs. Aiton & Co., Willesden Junction, London, N.W.; electricity meters, General Electric Co., Ltd., London, E.C. The total amount of the contracts, with the exception of the buildings and shaft, was 28,733*l*.

A feature of the inauguration was the illumination of the exterior of the works by a festoon of lights, fixed and completed within one hour. Altogether 450 lamps were used in the decoration. The work was undertaken by the Electric Lighting Boards, Ltd.

### HOUSE DRAINAGE DEPARTMENT, MANCHESTER.

THE ratepayers of Manchester, in common with those of other large towns, seldom display great interest in the details of municipal government. Comparatively few people, for instance, says the *Manchester Guardian*, have any idea of the extent of the operations of the sanitary committee of the City Council, with its eight or nine sub-committees, each having its own well-defined duties. The house drainage sub-committee is little known—save perhaps to property owners and their agents, to whom the knowledge has been brought home in a very practical and effective manner. Yet this department has been in existence, as a branch of municipal enterprise, for nearly six years. It was formed in April 1896 for the purpose of carrying out a certain class of work for which, nominally, the sanitary committee and the paving and highways committee were jointly responsible, but which, as a matter of fact, was then often neglected. It was another example of the unhappy results of a system of dual control.

The new department found no lack of work coming to its hand. According to a report presented in January 1898 by the manager, Mr. H. Prescott, the department was immediately deluged with work that had been standing over for months, and even years. At first there were only three inspectors, but it was soon found necessary to appoint two more, and now there were seven inspectors at work in the city under Mr. Prescott's directions, while in the offices of the department at the town hall a staff of eight clerks are engaged. The need for organised effort in dealing with the important matter of house drainage was amply proved by some facts and figures which were put forward by Mr. Prescott in the report in question. Of the drains examined by the inspectors 95 per cent. were found to be defective, while fully 80 per cent. were described as being in a "deplorable" condition. Of the orders of the sanitary committee executed up to that time by the House Drainage Department, over 35 per cent. originated through death, fever, or other sickness on the properties concerned. During the past few years the work of the department has grown steadily. In the financial year ending March last a sum of 26,903*l*. was expended on repairs, this being 1,205*l*. more than the amount so expended in the previous year. The total cost of work done between April 1896 and March 1901 was 125,774*l*. The actual working

# C. B. KENT & SONS

# BEST BRITISH BRUSHES

expenses of the department are most reasonable; they amount to something like 4 per cent. of the expenditure. Some idea of the extent and nature of the operations of the inspectors may be gathered from the fact that last year the number of houses dealt with was 5,258, and the number of business premises and public buildings 894, a total of 6,152. All this work—and it is work of the soundest and best character—cannot fail to have some little effect in the direction of improving the drainage of Manchester. That there is considerable room for improvement cannot be doubted. In the course of their duties the inspectors have made some remarkable discoveries. "Butt-ended pipes," without sockets, were found to be common, and so, as a consequence, were cesspools under dwelling-houses. What was described at the time as "a perfect death-trap" was brought to light recently beneath a refreshment-house quite in the centre of the city. It was a pool 17 feet deep, which had been lost sight of for many years, and its existence of course was at the time of its discovery quite unknown. The department in carrying out repairs insist upon the best material and the most efficient appliances being used. "Butt-ended pipes" are not tolerated; all new pipes must be socketed and must have proper cement fittings. The whole of the work is done by contract, according to fixed schedules of prices. At the Town Hall there is set out an interesting little "museum" containing full-sized specimens of work executed according to the department's specification and requirements. Here in effect contractors are shown a standard which they are expected "to live up to," and as a warning and an example to them there are also preserved specimens of work which would not now be tolerated—glaring examples of what can be done by careless and incompetent persons. For a time there were kept upon the premises certain strange curiosities in the way of drainage appliances which had been brought to light by the inspectors, but these became so numerous in the course of time that the interesting collection had to be dispersed. For the purpose of contracting, it may be mentioned, the city is divided into six districts, or rather into three districts—the north, central and southern portions of the city—each of which is in turn subdivided.

The department's system of working may be briefly described. When a nuisance is reported to the sanitary department, notice of fourteen or twenty-one days is served upon the owner of the property or his agent by the superintendent. If the necessary work has not been executed at the expiration of the notice one of the sanitary inspectors visits the property

and submits a report, and then the case is referred to the house drainage department. The next step is to issue a notice to the owner or agent that the Corporation is about to proceed with the work. If this is not effective the house drainage department, after a brief interval, instructs its contractor for the district in which the property is situated to remedy the nuisance. The repairs are carried out under the close supervision of one of the inspectors, and when the task is ended—before the work is covered up—the inspector thoroughly tests the drains (by means of the water test), measures up the work and submits an exact account of it to his department. He has previously reported upon the structural condition of the buildings, he has also prepared the necessary plans and has marked upon the Ordnance map the course and condition of any new drains. The department having received the inspector's final certificate, thereupon pays the contractor and forwards the bill to the property owner. If the bill is a large one and the owner is not able to pay it at once, he is allowed to extend his repayments over a considerable period, being charged interest at the rate of 5 per cent. until the account is discharged. The charges under the contract system are moderate, and the inspectors see that the work is well done. It is satisfactory to learn that complaints from property owners are practically unknown. On the contrary, owners are constantly requesting the department to execute work for them on signed orders, and many property owners and estate agents declare that they prefer that the department should take necessary repairs in hand. The inspectors are carefully selected. They are all trained men, and before they are appointed are required to pass a technical examination in the duties which they will be called upon to perform. The list of questions recently submitted to a candidate for the office of inspector is interesting as showing the nature of the work of the department. The candidate was asked to describe his method of laying new pipe-drains and jointing and testing them. He was requested to distinguish between a combined and a separate system of drainage, to define a single private drain, to state what kind of mortar he considered best for brickwork underground, and to enumerate the defects usually to be met with in house drainage. He was shown a complicated plan of drainage work, and was asked to indicate the portions repairable by the property owner and by the Corporation, and, finally, he was called upon to describe the precautions which should be taken in laying a drain through treacherous and water-logged ground. It will be understood from what has been written

that the House Drainage Department is organised upon business lines, and that it carries out its important duties in an efficient and satisfactory manner.

### ELECTRICITY AT MANCHESTER.

A MEETING of the electricity committee of the Manchester Corporation was held on the 23rd ult. The chairman (Dr. Bishop) presided. It was announced that the second of four engines, each of 3,000 horse-power, for the new generating station at Bloom Street had been completed and set in motion during last week. As a result the department is enabled to increase the supply to its customers to the extent of upwards of 50,000 candle-power lamps. The committee had under consideration the question of tenders for the provision of twelve boilers, with coal economisers and feed-pumps for the supplementary installation, equal to 12,000 horse-power, designed by Mr. Metzger, the chief electrical engineer, for the station at Stuart Street. It should be stated, in regard to the tenders for boilers, that an advertisement, with specifications, was prepared by the committee on November 8, and that the advertisement was inserted in the electrical engineering papers on their next issue, November 15. It also appeared in some other newspapers on the same date. It was requested that tenders should be in before noon on December 4. Between November 15 and that date, however, the chairman, the deputy-chairman (Mr. Hesketh) and the engineer discovered that the specification stated that "each boiler is to be fitted with Babcock & Wilcox's superheater, having a heating surface of 509 square feet," and that words which should have followed—"or other approved type"—had been omitted. It was obvious that the clause, as it stood, restricted competition, and it was resolved by the committee not to open the tenders which had come in, but to issue fresh specifications, leaving out entirely the names of Babcock & Wilcox. The clause, in its amended form, read, "each boiler is to be fitted with a superheater, having a heating surface," &c. The amended specifications were issued on December 7 to all persons who had applied for copies of the original specifications and had paid the customary deposit of 5 guineas, free of charge. The error was pointed out to them, and they were asked to tender afresh, and to revise their tenders if they thought necessary. The tenders received have been adjudicated upon, and the committee recommend the Council to accept that of Messrs.

Babcock & Wilcox, as being absolutely the lowest tender. With regard to automatic stokers, the original specification stated that "the stoking-gear is to be of the chain-grate coking, or other type," so that no limit was placed upon contractors, who were at liberty to use whatever type they thought proper. The committee recommend that the contract for coal economisers shall be placed with Messrs. Green, of Manchester, and that for feed-pumps with Messrs. Blake & Knowles, of London. These contracts will come before the City Council for approval or otherwise at the next meeting in the present month.

### THE INSTITUTION OF CIVIL ENGINEERS.

THE second general meeting of session 1901-2 of the Glasgow Association of Students was held in the Institution rooms, Bath Street, on the 23rd ult., the president, Mr. C. C. Lindsay, in the chair, when Mr. Jas. Conacher read a paper entitled "Notes on Design of Small Span Bridges." In the course of his lecture Mr. Conacher summed up the various causes of vibration in railway bridges which produce a resultant action, which will lie somewhere between one and two times the action of an equivalent dead load, and proceeded to quote the opinion of many eminent engineers expressed at a meeting of the Institute of Civil Engineers about two years ago, when the effect of a moving load on bridges was discussed. Summing up all these opinions, he came to the conclusion that some allowance to cover the effect of impact and vibration should be added to the live load, and that, as Sir Benjamin Baker had pointed out on that occasion, deflection is no test of the maximum stress in a girder as it may be initially stressed. The opinion of several authorities was then given as to how much this percentage of live load to be added should be. The general design of bridges was next considered, the author dealing specially with the important question of the strength of cross girders and their connections with main girders, and the respective advantages of the different types of trusses commonly employed in main girders. The author strongly favoured the use of single systems. Proceeding next to the question of the connections between diagonals and booms in trusses, the disadvantages of several types of joints were pointed out and a design of an ideal joint shown. In conclusion, the author strongly emphasised the importance of simplicity in design, with a careful consideration of details, without which no design could be thoroughly efficient. An

## The "ONE" Range.

PATENT 1331/01.

M. F. Co. LD. R.

These Ranges are Exhibited by the following London Firms:—

R. ADAMS, Newington Causeway;  
CLARK, HUNT & CO., Shoreditch;  
O'BRIEN, THOMAS & CO., Upper Thames Street;  
R. H. & J. PEARSON & CO., Ltd., Notting Hill Gate;  
ROWNSON, DREW & CO., Queen Victoria Street.

Agents for Liverpool:—  
THE WELL FIRE CO., Ltd.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

This Independent Range is fitted with hot water circulating boiler, as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The casing and oven door are lined with slag wool and a third oven can be arranged if required

interesting discussion followed, and a hearty vote of thanks to the author terminated the proceedings.

### AMERICAN HIGH BUILDINGS.

THE civil engineering work called for in the design and construction of a modern high building is, says the *Engineering Record*, like all more or less complicated affairs, the result of natural development, but a development in classes of work of far greater variety than is often contemplated. The largest building of thirty or forty years ago involved practically no engineering work of an advanced grade. The foundations were formed of simple masonry walls on footing courses sufficiently wide to produce a pressure which would generally be considered safe in the judgment of a mason. The opinion of a civil engineer was seldom considered necessary, and consequently seldom sought. Although real estate in spots was held at a high valuation, it had not then reached that point of value at which it becomes necessary to go as far heavenward or as deep as possible in the opposite direction to obtain the maximum rental space. Hence foundation loads were in all cases small, and foundation problems had practically not yet arisen. The same general observations can be applied to the superstructure. Simple brick or cut-stone walls, carried to a height of about five storeys at most, required no engineering design; it was simply the work of a mason to build an enclosing wall of moderate thickness, whose carrying capacity would ordinarily be far in excess of the loads to come upon it if laid up with reasonably good mortar. Within these walls were found the simplest arrangements of timber floors, carried either on timber columns, or possibly those of cast-iron, no feature of which, save possibly the cast-iron columns, was ever subjected to any very serious process of engineering design.

All this has been radically changed; the elevator and the steel frame have done their work most effectively. Floors to the number of twenty or twenty-five rise into space, and with their loads are carried on steel frames, which also support the exterior walls. The latter no longer support themselves, for sufficient thickness at the lower floors to perform that function would trench far too largely upon the available floor space of the building. The walls simply serve to protect the interior from the weather, and play the part of curtain walls only. The loads carried by the steel frame include the total weights of the entire structure and its contents above the supporting pedestal

blocks at the bases of the columns. These loads are necessarily enormously heavy. They may be uniformly distributed by devices arranged to accomplish that distribution over a considerable part or all of the foundation site; or they may be concentrated at suitable points where the columns rest, usually either upon pneumatic caissons or upon pile foundations.

The building proper is a piece of structural work involving some of the nicest questions of design in steel. All parts of the metal frame being concealed by the interior and exterior finish of the building, there is absolutely no evidence of the amount or quality of thought and care expended upon the disposition of the steelwork in order to meet the exacting demands of good design in the most effective and economical manner. This class of engineering work has always been considered of an elementary character, as it involves only rather simple combinations of beams and columns constantly under similar conditions. While this is true in many cases, as a matter of fact there are some questions involved in the design of columns for high buildings which have not yet been treated in a perfectly satisfactory manner. Whether the columns are cast-iron or of built-up steel sections, the loads which they carry are seldom or never applied at the centres of column section. The ends of the rolled or built beams which convey loads to the columns usually rest upon cast-iron brackets, or are bolted to cast-iron columns, or finally they may be rivetted to steel columns. Even in the latter instance they can seldom reasonably be considered as centrally applied. This is a point which rarely receives the attention which it deserves. Occasionally a detail equivalent to a diaphragm between the two sides of a column is employed, but without such a saving device heavy bending will be imposed upon the member designed to carry vertical loads only.

Great niceties of theory have been employed to compute the stresses induced by eccentric column loads. The trouble with such refined processes lies in the fact that the conditions assumed are practically never realised, and in spite of the utmost theoretical care no little stress uncertainty results. The highest grade of engineering design work is required to meet such exigencies, and it must usually consist in the introduction of conditions which avoid the causes of uncertainties and afford a design of unqualified strength and stiffness for a practically central load.

No less advanced engineering work is done in the foundations of these high buildings. Wherever they can be built directly upon rock, as north of about Fourteenth Street in New

York city, all foundations are obviously the simplest possible, but in the lower part of Manhattan Island foundation problems arise which call for the most skilful treatment. Although some of the heaviest buildings have been supported in an eminently satisfactory manner on piles or on plates of concrete reinforced in some places by embedded steel, it has become the fashionable method to employ pneumatic caissons. The latest advances in this latter class of work are most interesting. The caissons not only carry the vertical loads, which is their normal function, but they act as dams as well. The row of caissons around the boundary lines of the lot are so constructed and placed as to constitute a watertight enclosure. The result is that the basement volume below the water-level, as well as that above it, may be used for power storage or other purposes. In addition to the Mutual Life building now approaching completion in New York, this watertightness of the caisson dam or enclosure was secured by placing the caissons about a foot apart and then sealing this opening by the process of stock ramming, a considerable amount of clay in cartridges having been used for the purpose. It was a rather novel as well as successful application of the process, but it has rendered available basement space to a depth of about 60 feet below the natural surface of the ground. In the foundation of the Stock Exchange building the rectangular pneumatic caissons placed along the exterior lines of the lot were sunk end to end practically in contact with each other, provision having been made for an oblong well to be filled with concrete, half of which is formed by opposite recesses in the adjoining ends of two caissons. The details of these foundation constructions have been given in full in the *Engineering Record*, and a reference to them cannot fail to impress one with the value of these improvements in building foundations, which constitute a distinct advance in the application of pneumatic caissons to this class of engineering work.

#### A BUILDING CONTRACTOR'S EXPERIENCES.

A WELL-KNOWN building contractor, who has been in business in London for upwards of thirty years, and employs a large number of men, confirms most of the statements which have appeared in the *Times* in regard to the restriction of the quantity of work done by bricklayers and others connected with the building trades; for the evil is equally rife in the carpenters' and masons' shops and among painters and others.

As a rule, the contractor affirms, when a man is under the strict supervision of his society, he does not give half the quantity of work per day that he could and does give, often enough, when he is not conscious of the presence of the society "spy." "Directly that person is away," says the contractor, "you know it by the different manner in which the men go to work. You never know who the spy is, but you feel his presence." As an instance in point, he gave his experience in regard to the putting in of the foundation of a large chimney, when the bricklayers engaged upon it averaged 2,000 bricks per man in the day. Asked if this would not be considered "slop" work, he answered, "Decidedly not." It was careful work, but, being thick work, the trowel could be dispensed with, the bricklayer, after the mortar had been spread on the course, taking a brick in each hand and laying them side by side. Of course this could not be done if the workman would not lay down his trowel, which he often enough would not do if the society spy were about.

The contractor instanced another case in which men doing the best kind of work only recently set from ten to twelve hundred bricks per day. This was on a gentleman's house, at present in course of erection, just outside the London radius, and the average was the one for the whole of the work, not for any inferior portion of it. The contractor accounts for the high average of work in both these instances by the difficulty of society supervision, or, in other words, to the absence of the spy. In the case of the 2,000 bricks per day the work was done in a deep hole, which could not easily be overlooked. In the other case—that of the 1,000 to 1,200 bricks per day—the job is an hour's railway journey from town.

The contractor has invariably found that when a foreman is a man of character and energy, and not afraid of the society, the men will do more work. But if he belongs to the local society, and has not the power of asserting himself, there is no end of dilly-dallying work and time wasting. The method is this: the bricksetter will take up a brick, turn it round, lay it down again, and then handle and examine another in the same way, finally laying it after he has spent time enough over it to have laid, with diligence, two or three bricks. Thus there is a show of work, although it is calculated with the view to waste time.

The building contractor here referred to considers that this evil of restricting work has been greatly augmented during the last ten or twelve years, that is, since the London County Council undertook to do its own work. He cites instances in

Council Chamber at Hemel Hempstead, fitted and furnished by HEWETSONS.

which bricklayers working for the London County Council have laid but from 150 to 250 bricks a day. These cases were brought before the Council by their own architect, and were much commented upon at the time by the trade journals. "But," remarks one contractor, "the apathetic public, who, as the ultimate paymasters, are most concerned, allows the thing to go on, and will, no doubt, continue to allow it until the enormity of the thing brings about its own remedy." He cites instances in which work done by the Council's workmen cost more than double the price asked by a contractor. Curiously enough, a builder formerly under the London County Council, who was present during part of the conversation which elicited the above facts, threw in a confirmatory remark in the following terms:—"That is so. That job which you know my mate did cost 2,000*l.*, whereas the contractors' price was 900*l.*"

The contractor thinks there are signs that the evil is likely ere long to right itself. He holds that much of the evil has arisen from the fact that the trade union societies have been "run" very much in the past by the younger and less responsible members—that is, by the men who have not established homes of their own, and to whom it is life and amusement to attend the society meetings, fight the battles of the union, and feel important. To the older men, fathers of families, with other interests, the bother and turmoil of the societies have been a nuisance, and have, in consequence, had little of their attention. But our contractor now sees signs of a change. The shadow of trade shrinkage is before them, and they are, in consequence, beginning to feel that they must do something to secure themselves when there is not enough work to go all round. The contractor gives an instance—a unique one in his experience. On one of his jobs some bricklayers reported their foreman to the society because he was "badgering" them to give their employer a fair day's work. He was called up before the society, but, when the charge had been heard, it was the men who got the reprimand, not the foreman. To him the society officials offered an apology, telling him he had done nothing but his duty, and that they intended to put a stop to this sort of thing—that is, to the conspiracy among workmen to defraud employers of a fair day's work. They furthermore compelled the workmen who made the complaint to go to their foreman and beg his pardon.

It is worthy of note in this connection that the contractor, while severely condemning the tyranny of the societies and the immoral—because unmanly—practices which they have engendered, is by no means hostile to the trade unions, and

indeed holds that they have, on the whole, done great good. Another point worth mentioning is the fact—strongly attested by the contractor—that the workman in the building trades to-day is superior to his predecessor of twenty years ago in intelligence, education and moral character; but he is under the evil system established by his union, suffers under its tyrannous methods, and does not know how to break away and free himself. The contractor gives one instance of the way in which this tyranny works; it speaks volumes. The best foreman he ever had—one who was determined to do his duty—was, after paying twenty years to his society, defrauded of the benefit of his subscriptions because he was reported against by reason of his determination to have a proper day's work out of his men. Of course, he put himself technically in the wrong by getting a little behind in his payments. But it was because he resisted the union's methods that he became a marked man, and he was in the end driven to adopt another calling.

### VENTILATING AND HEATING.

AT the last meeting of the Edinburgh Architectural Association a paper was read by Councillor Mackenzie on "Ventilating and Heating." The lecturer began by calling attention to the necessity for a full supply of fresh air in the dwelling-house, and pointing out how little this cardinal doctrine was apparently understood, or at least carried out. Incidentally, he mentioned that eight or more persons often travelled in a single compartment of a railway carriage with the doors shut, so that they had only about 245 feet—30 cubic feet per head—and he characterised that as a veritable death-breeding trap. He went on to say that some of the sleeping berths of the London trains, where a person was locked up for eight hours, were almost as bad, and that all that took place whilst authorities alleged that a healthy adult in repose required 2,000 cubic feet of fresh air for healthy breathing. Mr. Mackenzie's strongest indictment, however, was made against the want of fresh air in the dwelling-house, and more especially in the bedroom, which most people thought should be as closely secured against any incoming air as it was possible to make it, and he was persuaded that more consumption and other diseases were contracted through foul air in bedrooms than in any other manner, by the lowering of the vitality of the body and making it a fit breeding-place for all kinds of infectious and other diseases. He next adverted to the venti-

lation of churches and public buildings, and while admitting the desirableness of good ventilation in these, expressed some surprise that so much should be made of having to sit for one hour and a half in the week in a polluted atmosphere in the church when no objection was taken to sleeping seven hours per day in the poisonous atmosphere of the unventilated bedroom. He did not think the lower classes were much more to blame than the classes above them, as he often found the most deplorable want of education on this subject among educated people. Crowded schools should be as thoroughly ventilated as possible by mechanical means, and it was not there, he said, that economical ideas of cheapness should be entertained. Passing on to the second portion of his subject, namely, heating, he expressed his very strong partiality for the open fire as the cheeriest and the healthiest means of heating and promoting ventilation. He admitted its want of economy as compared with the close stove, but with all its drawbacks he put the open fire first. In large rooms he would supplement the open fire by fixing hot-water radiators where most suitable, but condemned altogether the hiding of hot-water pipes or coils in cases or behind screens, where they could not be regularly cleaned. Putting the open fire first, Mr. Mackenzie put the gas-stove without a chimney last. That, he thought, was the worst possible means of heating. A gas-stove, vomiting out poisonous fumes into the atmosphere of a room, was nothing else than a poison manufactory, and should be prohibited by law. The fact of such a stove not giving off an offensive smell only added to the danger from the apparatus. He pointed out that when gas was burned carbonic gas must be given off, which, although not directly a poison, did not support life, and polluted the air. He went further, and said that often from imperfect combustion carbonic oxide—a most deadly poison—was generated, the effects of which had often proved fatal. He believed gas had a great future before it as a heating agent, but he trusted that effectual means would always be taken to get rid of the fumes. Passing on to deal with the principle on which hot-water heating was carried out, Mr. Mackenzie explained from a cartoon how, when heat was applied to the boiler of a hot-water apparatus, circulation was set up, and the water in the flow-pipe of such an apparatus rose up away from the centre of gravity in apparent defiance of the great universal law of gravitation. He explained this by pointing out the effect of the expansion of water by heat, and the consequent greater pressure downwards of the colder and denser column of water in the return, which was

really the cause of the flow upwards of the water in the flow-pipe. Reference was made to the system of hot-water heating by small-bore pipes, known as Perkins's system, and, whilst admitting its advantages, he pointed out that, from its greater complexity, its liability to freeze when not in use, and the impracticableness of having valves to shut off portions of the apparatus, it was rapidly losing favour. He next mentioned the various systems of steam heating, pointing out that in heating large buildings steam was essential from its greater range and flexibility. He advised that, in estimating the amount of heating for any building, a basis of 25 deg. of frost outside should be taken, in order that when the cold weather came—though it might not come for years—the apparatus might be able to keep 50 or 60 deg. Fahr. inside. He quoted figures for arriving at the proper quantity, but pointed out the difficulty of any formula which could be applied universally without the application of experience and common sense. Finally, he made allusion to the usual mode in which architects proceeded in getting three or four heating engineers to give schemes and estimates, which had no common basis, and which varied widely in cost, the upshot often being that the cheapest scheme was taken, which frequently turned out to be the dearest, because the worst, in the end.

Mr. A. Hunter Crawford moved a vote of thanks to Councillor Mackenzie.

Councillor Purves, who was present, and was asked to join in the discussion, said there was a great future for gas heating, and also a great future for gas in other ways. It had the advantage over other forms of illumination in that it was a means of ventilation, and in that respect it was very useful in many of the large halls in the city. He hoped, however, that the question between gas light and electric light would in Edinburgh always be, as it had been in the past, one of friendly rivalry; and he went on to say that all who were interested in public health affairs could not fail to take a deep interest in the question which was under discussion that night.

Mr. D. Macfie said that with regard to ventilation generally in this country they owed a good deal, perhaps their lives, to the loose-fitting joiner work, and they should not be too severe on the scamped work if it resulted in greater ventilation.

Mr. W. M. Page seconded the motion of thanks, and it was heartily agreed to.

Councillor Mackenzie afterwards briefly and humorously replied to the discussion.

# The Architect.

## THE WEEK.

ACCORDING to the Public Health Act of 1875, "the re-erecting of any building pulled down to or below the ground-floor, or of any frame building of which only the framework is left down to the ground-floor, or the conversion into a dwelling-house of any building not originally constructed for human habitation, or the conversion into more than one dwelling-house of a building originally constructed as one dwelling-house only, shall be considered the erection of a new building." A case was brought before the last meeting of the Bognor Urban Council in which there was some difference of opinion whether some buildings which are now in progress in the town constituted new buildings. The surveyor declared in the affirmative, and reported that the buildings were not in accordance with the by-laws. The owner of the buildings, who was present as a member of the Council, maintained that what was done was no more than an addition to a building and could not be subjected to the by-laws. The Clerk said that if the Council accepted the surveyor's opinion fresh plans should be deposited. The Council resolved that the owner should be asked to deposit plans. If an ordinary builder had neglected to observe the by-law, his plea that he was simply adding to an old building would be rejected. In such cases there should be uniformity of practice, and instead of having one course for members of a Council and another for non-members, all departures from by-laws should be treated in the same impartial way. Similar cases are constantly occurring in other towns, and it is time the Local Government Board interfered and insisted on one manner of dealing with all infractions of by-laws.

THE explorations by French archaeologists at Delphi continue to be carried on with energy. The director is M. THÉOPHILE HOMOLLES. The operations have lasted about ten years. The Temple of Apollo was the reward for the labours between 1892-96. In 1898 the gymnasium and the palaestra were fully revealed. What by some is considered the principal work is now in hand, and that is the opening out of the terrace. No less than five temples stood within this precinct. The first was in the Doric style, measuring 30 metres by 15 metres and having a tately pronaos. The building suffered through an earthquake. It has been found possible to set up four of the columns, which had a height of about 13 feet 6 inches. There were two treasuries; the foundations of one remain, and a larger part of the second structure, which was erected in the sixth century before our era. Perhaps the most remarkable discovery is a circular temple of about 5 metres in diameter; the roof was supported by twenty columns, which were admirable types of the Doric style. A great many capitals were met with in excellent condition, which present many similarities with the Propylæum of Athens. The metopes of the temple were at one time filled with sculpture. Unfortunately not one is complete, but many fragments of the figures remain. Evidently they were advanced in style. For another temple a blue marble was used by the builders. It is believed to have been the temple dedicated to ATHENÆ, and presents a combination of the Doric and Ionic styles. A museum is to be erected at the cost of M. SYNGROS, a Greek. It will probably be opened in April, and by that time the work of the explorers will be nearly completed.

THE late A. C. LAMB was not satisfied with writing a book on "Dundee: its Ancient and Historic Buildings," but he spent a great part of his life in collecting articles relating to the history of the town. Dundee, it should be remembered, can claim to have antiquity, and it is supposed several of the kings of Scotland resided within the walls. In CROMWELL'S time it was one of the wealthiest cities in Scotland, and the Parliamentary soldiers who took part in its capture were able to reward themselves by plun- der. Mr. LAMB utilised opportunities, which are every year becoming more rare, to secure many things

which in the eyes of the student of history and archaeology have interest. His collection contains about 10,000 articles. Through the liberality of Mr. EDWARD COX, they have been secured for the advantage of the inhabitants of Dundee, and at present they are shown in the Victoria Art Galleries. The number of towns which possess evidence of life in past times is limited, one reason being that men of the class of the late A. C. LAMB are rare. The ordinary collector is indifferent about the source of his acquisition, but what is to be desired is the devotion of men to illustrating the past history of a particular town or parish. As knowledge extends people take more and more interest in local collections, and would prefer specimens of the garments worn a couple of hundred years ago rather than mummies from Egypt or war-clubs from South Sea Islands.

THE immense labour which is often expended on the foundations of buildings is, from the character of the work, quickly ignored. It cannot be stated on a building that the foundations descend 20 or 30 feet, and ordinary people therefore assume that the depth is no more than a few feet, and involved no difficulty. Anyone who was acquainted with Paris when the foundations of the church of the Sacred Heart at Montmartre were laid must have been amazed at their extent and costliness. An English builder would say it would have been far more economical to have sought a site in some other position; but the desire was to dominate Paris by means of the church, and with that object more money was expended on subterranean masonry than would have been required to construct as large a church elsewhere. The outlay seemed more extravagant because the whole of the site is rocky, but the white limestone of Paris is full of interstices, and the promoters of the memorial church were resolved that no settlement should occur. Consequently an immense proportion of the subscriptions was devoted to invisible work and a long time had to elapse before masonry was to be seen above ground to represent so much expenditure. The anxiety to gain security was misinterpreted by some of the opponents of the church, and an official inquiry was made into the allegation that a source of danger to Paris was being created. The specialists who examined the hill of Montmartre decided there was no cause for alarm. Now that the building has been nearly completed similar stories are heard. It is only necessary to observe the absence of all signs of settlement in the masonry for a Parisian to be assured that he may set up his residence in the neighbourhood of the church without any fear that he will be overcome by the stupendous masonry.

ANYONE who will glance at a map of Paris of the date 1850, or later, will perceive that the streets in the two divisions of the city left and right of the river appear as if they were laid out to form two independent cities rather than one. The bridges across the Seine are so numerous, they form a remarkable view, especially when seen from a height. But generally speaking the streets running north and south, by which the bridges are approached, do not form direct lines of communication. The Boulevard Saint-Michel and the Boulevard Sébastopol may still be regarded as the most important thoroughfare between the two parts of Paris. The Avenue de l'Opéra is one of the streets in Paris in which a crowd is commonly found, but it is necessary to take an oblique course from it by passing either through or round the Louvre in order to reach the Quartier Latin. It is now proposed to form a new means of communication. The Rue de Rennes is a fine modern street which connects the Gare Montparnasse with the Boulevard Saint Germain; but from the latter the approach to the river is by the tortuous Rue Bonaparte. An extension of the Rue de Rennes to the Quai at the Institut has been suggested, and then a skew bridge to join it with the Rue du Louvre, where is the central telephone station and post office. In that way communication with the principal boulevard will be facilitated. It is intended that the bridge shall be constructed in a costly manner, as if it were to be a rival to the Pont Alexandre III. The operations will not require the demolition of any of the old landmarks of Paris.

## CONSTRUCTION AND INSURANCE.

SOME days ago a fire arose in Dublin in one of those general warehouses or shops in which everything is obtainable that is required by ordinary purchasers. Like the majority of structures of its class the supports were reduced to a minimum, in order that as much free space as possible should be left for the exhibition of goods and the accommodation of customers. The buildings quickly succumbed. The loss to the owners is, we believe, amply provided for by insurances.

Most people will see nothing extraordinary in the occurrence. A group of buildings and a large amount of stock have been destroyed, but they can be replaced by the payment of some hundreds of thousands of pounds by insurance offices. If the latter have to suffer it will be said that was only to be anticipated. Premiums are paid, and therefore risks have to be accepted. New buildings can be erected and a fresh supply of goods imported. The business world then revolves with its usual regularity and smoothness. Meanwhile, however, appeals are made on behalf of the hundreds of employes who find themselves without occupation in the winter season. For the misery to which a great fire subjects many men and women there is no compensation, and they must often depend on public charity.

What has happened in Dublin is only the latest of many cases which are constantly arising, and which should be enough to make people reflect that the conflagration of a building and the annihilation of its contents should never be looked upon as a trivial affair, an incident in commercialism. There is an absolute loss of property in such cases which can rarely be afforded, and it is only a very narrow view of social economy which is taken whenever it is concluded that by the payment of premiums to insurance companies the results of destruction by fire are counteracted. The supposition that an evil ceases to exist because the effects of it are transferred from an individual or individuals to a public company is one which should be refuted in an authoritative manner. The American humourists, who constantly treat the subject as if it were one of the tricks of trade, are not serving the cause of honesty.

The various companies who provide for the effects of fire are obliged to recognise their position. They know that the public in general will always take a philosophic view of the losses which the fire offices are compelled to meet. As a consequence they have endeavoured not only to urge the necessity of adopting the best means for coping with fires in order to prevent the destruction of property, but they have also as far as possible insisted in their own interests on the necessity of a kind of construction which will not quickly succumb whenever a fire arises. It must be allowed that municipal authorities as well as the public in general have not always shown a disposition to co-operate with the insurance companies. It is assumed that the latter are not disinterested and are merely seeking to increase their profits. The only means open to the societies is to place a high rate on buildings which do not come up to a certain standard, or, in other words, to premiate construction that will not be quickly consumed. From time to time information is given about the standard adopted, and the latest we are about to describe. The rules were prepared two or three weeks since by the associated fire offices, with the object of encouraging the construction of buildings which will possess more fire-resisting qualities than many of the structures which are now ordinarily classed as "fireproof."

It is not to be expected that in dealing with a subject so multiplex as buildings an elaborate system of classification must be adopted. Business could not be carried on in the insurance offices unless the rates were as nearly as possible of an uniform character. All calculations of risk have to be based on averages. No more than two varieties of standard fire-resisting buildings have been recognised by the latest arrangement. The first division comprises ordinary buildings used as salesshops, warehouses, factories, excluding cotton mills and buildings occupied for other similar textile trades. The second division comprises buildings occupied as cotton mills, woollen mills, as well as buildings for other textile trades.

*Height and Cubical Contents.*

In the first division the height is not to exceed 80 feet, measured from the lowest point of the land-level or

ground line of the site on which the building stands to the level of the highest part of the roof. The cubical content of any one compartment are not to exceed 60,000 cubic feet. The contents are to be computed on the whole surface area, including half of the party walls and the whole of the external walls, and the actual height from the surface of the lowest floor.

In the second division the height is not to exceed four storeys and cellar. The ceiling of the cellar is not to be more than 3 feet above the lowest point of the land-level or ground line of the site on which the building stands. The superficial area of any one compartment must not exceed 25,000 square feet internal measurement, excluding area of window recesses and doorways. The height of any compartment, excluding cellar, should be not less than 12 feet, measuring from the floor level to the highest point of the ceiling.

*External, Party and Internal Walls and Partitions.*

The suggested regulations are as follows:—Brick, terra-cotta, and (or) cement concrete composed of broken brick, burnt ballast, furnace slag, clinker, or other similar hard and burnt material to be employed. No external or party or division wall to be less than 13 inches thick in any part or if of concrete 20 inches. Stone to be used externally only as ashlar or facing, with a backing of brickwork not less than 13 inches thick, and for dressings, sills, string courses and cornices. All internal partitions to be of incombustible material, excepting only office enclosures of hard non-resinous wood with or without glazing, there is any building adjoining, the dividing or party wall to extend at least 3 feet above the roof of the fire-resisting building.

*Flues.*

There is also uniformity in the specification for flues the two divisions of buildings, viz.:—All flues to be built of brickwork, no part of which towards the interior of the building is to be less than 9 inches thick, and all furnace flues to be lined with fire-brick throughout for a distance of at least 20 feet from the furnace. No timber or woodwork to rest in or be plugged into the brickwork of any flue.

*Openings in Walls.*

The directions for openings in walls of the first division are as follows:—The total superficial area of openings in each external or area wall of any storey above the ground storey not to exceed one-half of the area of the wall (measured as to height from floor to ceiling of the storey in which the openings occur). All loop-hole or teagle doors and frames and window frames and sashes to be of iron or other hard metal. All windows above the ground storey to be glazed with glass not less than  $\frac{1}{4}$  inch thick, in sections not larger than 2 superficial feet, or wired glass not exceeding  $\frac{1}{8}$  inch mesh in sections not larger than 4 superficial feet. Every window or other opening above the ground storey opposing (whether directly or diagonally) and within 20 feet of any window, skylight, or glazed or other opening in any other building (whether such latter window, skylight, or opening be protected or not), or overlooking (whether directly or diagonally) and within 20 feet of the roof of any building, to be protected by "fireproof" shutters or "fireproof" doors.

In the second division the rules relate to openings in any storey, and there is an omission of the part concerning glass. But for all practical purposes the two classes of buildings, we suppose, may be considered as alike in respect of openings.

*Floors.*

The following is laid down for floors in buildings of the first division:—Brick arches, terra-cotta, fireclay or concrete as above described, the floor being in no part less than 6 inches in thickness, and carried on metal joists, girders and columns, or brick walls or piers. Floors of wood not less than 9 inches thick, ceiled with plaster on nailing lathing and with the floor-boards laid on the bearers without intervening space are allowed. Wooden flooring laid on concrete allowed, provided there is no space between the wood and the concrete. Wooden fillets not exceeding 2 inches deep permitted if bedded flush in the concrete. Scuppers to carry off water, the opening of each of which shall not be less in area than 21 superficial inches, to be

provided in the external walls to each floor above the ground storey at intervals of not more than 12 feet. In buildings within the City of London, or within the area controlled by the London County Council, scuppers are not essential.

In the second division brick arches, terra-cotta and fire-clay are mentioned as well as concrete, as materials on which modern flooring can be laid. The wooden fillets are not to exceed 3 inches deep, and the scuppers are to be provided at intervals of not more than 25 feet.

#### *Roofs.*

Concerning roofs in the first division, it is laid down:—Roofs to be entirely of the incombustible materials as described for floors, except that 4 inches be substituted for 6 inches in thickness. Glass not less than  $\frac{1}{4}$  inch thick in sections not exceeding 36 superficial inches, and wired glass not exceeding 1 inch mesh, in sections not exceeding 144 superficial inches, in either case set in metal, shall for the purpose of this rule be deemed incombustible. Outlets on to roofs rendered necessary to satisfy the requirements of the Factories and Workshops Acts permitted, provided that all doors and frames be of iron or cased in iron plate at least  $\frac{1}{8}$ th of an inch thick, and that they be self-closing.

The only difference between the foregoing rule and that for the second division is the following addition:—"There may be erected above them [the roofs] light shelters or roofs constructed entirely of incombustible materials."

#### *Protection of Metalwork.*

The rules for the protection of structural metalwork are identical in both divisions, viz.:—All columns or stanchions to be covered with brickwork or porous terra-cotta (at least 2 inches thick), or with cement, concrete, or plaster at least  $1\frac{1}{2}$  inch thick, keyed into metal supports and protected by a metal guard up to a height of not less than 4 feet from the floor where cement, concrete or plaster only used. Girders, joists, lintels and all structural metalwork (other than columns and stanchions, but including framework of roofs), where not covered with brickwork, to be completely encased in porous terra-cotta at least 2 inches thick, securely anchored, or cement, concrete or plaster at least 1 inch thick, keyed into metal supports. Space must be left at the ends of girders and joists to permit of expansion.

#### *Linings and Ceilings.*

In both divisions it is stated "that no lining of wood or textile fabric to any part of the walls, partitions, ceilings, or roof is advisable."

#### *Floor Openings.*

From an insurance point of view no subject is of more importance than the floor openings. For the first division of standard fire-resisting buildings the subjoined particulars have been agreed on:—

No openings through any floors allowed except as follows:—

(a) Holes to admit driving shafts, pipes and iron or earthenware tubes for electric conductors. Shafts to fit closely in metal collars, and all pipes and tubes to be cemented round the full thickness of the floor.

(b) Staircases and hoists of which the enclosures are constructed entirely of brick or cement concrete as above described at least 9 inches thick, with a regulation fireproof floor to every opening. Stairs and landings within said enclosures to be constructed of incombustible material. Where the building is within the City of London or in the area controlled by the London County Council, hardwood doors to openings may be allowed instead of fireproof doors. Where the staircases and hoists extend to the top floors they must have a glass roof protected externally with strong wirework, and the enclosing walls must be carried through and 18 inches above the roof of the building. In factories and workshops in the area controlled by the London County Council a glass roof protected as above is only to be provided in cases where the enclosing walls and staircases are carried through and 18 inches above the roof of the building, and also above the roof of the adjoining premises. Otherwise the roof must comply with the requirements of the London County Council.

(c) Belting and rope races enclosed as for staircases and hoists.

In the second division the particulars given are:—

No openings through any floors allowed except holes to admit steam, gas and water pipes, and iron or earthenware tubes for electric conductors. All pipes and tubes to be cemented round the full thickness of the floor.

All staircases, hoists, rope and strap races, and gearing towers to be external to the four walls of the building and constructed entirely of brick or cement concrete as above described at least 9 inches thick.

Hoists must be constructed in the staircase enclosures, and no opening thereto to be less than 6 feet from any opening into the building. Excepting hoists the enclosing walls must be carried through and 18 inches above the roof of the building, and the roofs, stairs and landings of said enclosures must be constructed of incombustible material. No openings permitted between the building and the rope and strap races and gearing towers, and each opening from the staircase into the building to be protected by a fireproof door.

#### *Shafting through Walls.*

The following regulations are the same in both divisions:—

Shafting where passing through walls to fit closely into wall, or have wall boxes closed with iron plates not less than  $\frac{1}{4}$  inch thick, leaving no open space.

#### *Communicating Compartments.*

The following rules are given for the first division:—

Two or more compartments, each constructed in accordance with these rules, may communicate, whether by double "fireproof" doors or otherwise, provided that their aggregate cubical contents do not exceed 60,000 cubic feet.

Two or more such compartments, whose aggregate cubical contents exceed 60,000 cubic feet, can only be allowed to communicate across a fireproof compartment built up from the basement with walls of solid brickwork, and constructed in all other respects in accordance with these rules so far as the same are applicable, and having all openings protected by "fireproof doors" at least 6 feet apart.

Except as above, no communication allowed between a compartment constructed in accordance with these rules and any other building or compartment.

It will be observed that the associated Fire Offices do not interfere with the conditions laid down in the by-laws, which are mainly intended to prevent the spread of fire from one building to another. The foregoing regulations are intended to serve for confining a fire to the minimum space within a building.

### OLD MASTERS EXHIBITION.

WHETHER the exhibition of works by old masters which was opened at the Royal Academy on Monday is to be associated with the name of RAPHAEL or of CLAUDE will be a subject of discussion among amateurs until the middle of March. Numerically CLAUDE is the greater power, for two rooms have been assigned to his works and drawings. On the other hand, to have eleven works by RAPHAEL on view is a unique occurrence in the annals of English exhibitions. The collection should perhaps be regarded as one of great Italians. There is a work by RAPHAEL's master, PERUGINO; two by FRA BARTOLOMMEO, who exercised much influence over the young painter from Urbino; five by TITIAN; three by TINTORETTO; three by VERONESE; three by LUINI, and there is a *Mona Lisa*, which is ascribed to LEONARDO. Many other Italians are represented. There are also works by several Dutch and Flemish artists in the rooms; three by MURILLO and five by VELASQUEZ. The French school asserts itself, for there are pictures by CHARDIN, GREUZE, the two POUSSINS and LESUEUR. ALBERT DÜRER, KNELLER and HOLBEIN present some of the characteristics of the German school. The mere catalogue is enough to indicate how delightful an exhibition has been provided by the efforts of the Royal Academicians. Since the series commenced in 1870 we doubt if one has been held which was more interesting and more useful to the English student of art.

The first work that is likely to attract the attention of

the visitor is *The Madonna of the Iris*, by ALBERT DÜRER. The Virgin and Child are seated in a garden in which there are not only plants, but thin stems of trees that seem to be the beginning of a summer-house. The artist was fond of devising symbolism, and in thus suggesting the formation of a natural structure he may have had a meaning that is yet to be explained. In the background is an arch, but some of the stones forming the abutments project in a marked way beyond the general vertical line. This arrangement, which is not pleasing in a pictorial sense, must also have had a signification, and is likely to have some connection with the espalier near the figures. The Virgin wears a red robe, on which a butterfly is painted. She is of the German type, with flaxen curly locks. It is a strange work, but is further evidence that DÜRER'S province was one of black and white. The small miniature *Salvator Mundi*, by JEHAN BELLEGAMBE, is as interesting from the exquisitely carved frame as from the painting. The subject is the Adoration of CHRIST by an abbot who wears a grand cope, and has his shield painted on the desk at which he kneels. Another *Virgin and Child* is by ANDREA PREVITALI, of Bergamo; the Virgin places her hand on the head of the donor, which must have been a favourite attitude in the painter's eyes, because it is repeated in a picture by him in the National Gallery. By BENOZZO GOZZOLI is a *Virgin and Child with Angels*, which is finely finished; it is almost Byzantine in expression, and suggests the pupil of FRA ANGELICO. *The Church of St. Giles at St. Denis*, by a master of the Flemish school, is one of the most elaborate interiors to be found in the exhibition. A priest is saying Mass at an altar having a splendid reredos in gilded bronze, the central panel being occupied by a figure of CHRIST holding a cross and the book of gospels. As is usually the case whenever there is an archæological subject to be mentioned, the catalogue erroneously informs us how "on the back of the panel is a figure of St. PETER by another hand." Kneeling at one side of the altar is an emperor, and near him are several courtiers. The church is Gothic and abounds in sculpture, which is painted with the utmost elaboration of detail.

The two panels for cassoni, or trunks for bride's clothes, by PESELLINO, are among the most charming works in the room. They represent the story of DAVID and GOLIATH and the procession of SAUL and DAVID from Gath to Jerusalem. Each measures 17 inches by 70 inches, and both are crowded with figures of men, women and horses. Most of the individuals were probably inhabitants of Florence in the early part of the fifteenth century. As compositions the treatment of the subject is naive, for the incidents are represented as if they were synchronous instead of successive. Difficulties were created, such as in the foreshortening of horses, in order to display skill in overcoming them. But the general effect is decorative, and they are as quietly gorgeous as any of the old-fashioned golden tea chests which at one time used to be treasured.

There are four small pictures on the wall by RAPHAEL, viz. *The Agony in the Garden*, *St. Francis of Assisi*, *The Carrying of the Cross*, and *St. Anthony of Padua*, which with another panel that has found its way to America formed the predella to the great altar-piece in the third gallery known as the *Colonna Raphael*. The four are remarkably simple in style, the *St. Francis* and *St. Anthony* being the most complete of the series. Probably the panels were overshadowed by the framing of the big picture, or were partly obscured by altar candlesticks or other instrumenta, for the execution suggests the prentice hand in a way which is not common with the master. *The Flagellation*, by PERUGINO, was, we believe, reproduced by the Arundel Society. There are three figures. CHRIST is attached in the centre to a pillar of beautiful marble with a Corinthian capital, and behind is a fine arcade with medallions in the spandrels. There are two executioners, each in the act of using a corded scourge, but not the least scar is visible. PERUGINO had not a reputation in his own time for being as devout a man as many contemporary painters; but in this case he must have either thought it would be degradation of CHRIST to represent Him bleeding, or a degradation of his art to appeal to sensationalism. It is to be regretted that CARLO CRIVELLI has not left us a fruit-piece, or one in which fruit, architecture and draperies

would be combined as an example of still life. No fifteenth-century painter took more delight in introducing fruit. In the picture by him in the exhibition, apples and other fruit are suspended about the chair in which the Virgin and Child are placed. The painter was not afraid to clothe his saints in the richest garments or to adorn them with jewels and whatever was costly. There is more beautiful head in the room than *La Bella Simonetta*, the lady-love of GIULIANO DE MEDICI. SANDRO BOTTICELLI it is evident was satisfied with faithful portraiture in this case. The hands cannot be called successful; the great mass of pearls around the neck give a fantastic appearance to the subject. *The Portrait of a Man*, from the National Gallery of Ireland, evidently extends to the hands of the violinist, and from them we can judge of his style of playing. A representation of the hands of Herr JOACHIM placed beside them would almost be a revelation of the difference between ancient and modern instrumentation.

We suppose few visitors will care to bestow a look on *The Misers* of QUENTIN-MATYS, and it is a pity all the repetitions of the work have not long since shared the fate of better pictures. There are doubts whether the painter perpetrated so many replicas, and they ought to be kept concealed from the public gaze. *The Portrait of a Man*, by ANDREA DEL SARTO, is more like a young lady masquerading as a doctor, and would serve admirably for the young and learned doctor of Rome called BALTHASAR, better known to Englishmen as PORTIA, the lady of Belmont, who rescued ANTONIO merchant of Venice, from the knife and scales of SHYLOCK. ANTONIO POLLAIUOLO was a sculptor, and his painting *A Sacrifice*, seems like a copy of a bas-relief or a design for one. The portrait of *Girolamo Benivieni*, by RIDOLFO GHIRLANDAIO, would be sufficient by itself to uphold the artist's reputation as a portraitist. The old man in black with the clenched mouth, who looks so steadily at the spectator, was probably an able politician, and, like so many men of his class, may have helped by his ability to enslave Florence. There are three Holy Families by BERNARDINO LUINI in the room. They should be prized for they have the sweetness of expression in the principal figure which this painter alone acquired from his master LEONARDO. *The Adoration of the Shepherds*, by GIOVANNI BELLINI, somehow is more suggestive of BASSANO than the teacher of TITIAN and GIORGIONE.

If we are allowed to judge by the contents of the second gallery, we cannot avoid the conclusion that CLAUDE must be numbered among the painters whose reputation is not enhanced when several of their works are brought together. The pictures by him in Burlington House are generally very dull, for the glowing effects could not resist the power of time, while a few which are of extraordinary brilliancy appear unreal from the vicinity of the faded scenes. Several of the subjects are seaports, and show magnificent buildings on the shores. The architecture was a creation of CLAUDE'S, for in such parts, as GOETHE remarked, the painter attained the highest truth without showing the least trace of actuality. But in modern times artists have over-emphasised the realities of all coast and river scenes, and therefore CLAUDE'S Classical ports seem less truthful than his views of the interior of a country. He appears to have been a man of serene disposition, and he represented nature in conditions which corresponded with his own mind. Winter scenes, views on stormy days and whatever marred the severity of the seasons were avoided by him. We who live in northern climes are compelled to consider the slighted world which CLAUDE depicted as inadequate, if not unreal. With a single picture of his there cannot be objections raised except on account of idealism. But when we have from twenty to thirty similar views then we must be discontented with the limitation of the artist's selection. With him the earth was always enjoying calmness and sunshine. We think it will be found that the sixty drawings which are in the Black and White Room receive more attention. It is true they are not always transcripts from nature, and CLAUDE still seems indifferent to the variety which land offers the landscapist by means of the four seasons, but they suggest open-air work, and critics are not likely to be analytical when the drawing is so spirited and when less formalism is seen than in the paintings.

In Gallery No. III. the first picture met with is *Moses and the Burning Bush* by BASSANO. It is a very dark picture, and all that can be distinguished on a gloomy day is a figure lying on the ground, with a dog and some sheep. FRA BARTOLOMMEO'S *Holy Family* includes St. ELIZABETH and St. JOHN. The figures have the naturalness which is characteristic of the painter who, although a monk, was satisfied with the beings in the streets of Florence as models. SUSTERMANS'S *Cardinal Capponi* is a full-length seated figure, and reveals a prelate who seemed born to command. There is a pathetic *Christ at the Pillar* after the scourging, with two sympathising angels, by MURILLO. It has more tragic power than is usually seen in works by the Spanish artist. *The Death of Peter Martyr* is a copy by ANNIBALE CARRACCI of the picture by TITIAN which was destroyed in 1866. The first impression it makes is one of coldness, which is not usual with the Venetian master. But it is well to remember that, although he did not represent the martyr and his brother monk in the garb worn by the Dominicans, he wished to suggest their black and white robes. There is not a trace of red in the picture or other warm colour. But the contrast with the majority of the works of TITIAN may have helped to increase the effect which the original work made on spectators. A *Virgin and Child* by RAPHAEL, belonging to Miss MACKINTOSH, departs from the painter's types of Madonnas, or rather those which are generally accepted as his work, but it is a charming picture, and more expressive than many of RAPHAEL'S women. TINTORETTO was known to his contemporaries as Il Furioso, for he was said to be competent to produce as much work in a couple of days as would occupy another artist a couple of years. On that account he might be regarded by the Venetian populace as the equal of TITIAN, but we cannot believe that most potent, grave and reverend signiors would accept that judgment. The *Delilah and Samson* tells its story clearly; the courtesan is calmly watching the operation of the hair-cutting, and the man with the scissors performs his function in a businesslike way. DELILAH wears an abundance of jewellery, but she wants the witchery which was imparted to Mr. S. J. SOLOMON'S figure. It is possible to have a superstitious reverence for old masters, and when they are excelled by living English painters the fact should be announced. The *Marchese Savagno* by TITIAN, being larger than life, is suggestive of a Venetian GOLIATH. He is soberly clad, and the contrast offered by the crimson sash against the dark robe was at one time more marked than at present. The painter's own portrait expresses mental power, which is absent from engravings of TITIAN. He was able to see through men, however exalted, and the insight he possessed did not fail him when he made himself a subject. Looking at this portrait we feel that TITIAN was qualified to rule Venice in other ways besides art, and an emperor was not demeaning himself when he stooped to lift the painter's pencil. Another portrait by TITIAN is of a very young man, and in a different style.

The large *Virgin and Child Enthroned, with Saints*, known as the *Colonna Raphael*, and which Mr. PIERPONT MORGAN has acquired, is about 8 feet in height and 5 feet 6 inches in width. It was painted in 1505 for the nuns of St. Anthony of Padua, in Perugia. They objected to the introduction of a nude child in the altar-piece, or it may be were desirous to see the Infant CHRIST in the habit of their confraternity or guild. Accordingly the Madonna holds a Child wearing a white robe with a badge or scapular on the shoulder. St. JOHN, St. CATHERINE and St. ROSALIA are near the throne on which the Virgin is placed. Below are figures of St. PETER and St. PAUL. There is a lunette above, in which the Almighty is seen holding a globe with an angel on either side, whose streamers fill the intervening spaces. Beneath the principal panel were the small pieces to which we have referred above. As RAPHAEL was born in 1483, he was a very young man when he undertook so large an altar-piece. Indeed he had only left PERUGINO'S atelier in 1504, and the influence of his master was still oppressive. In 1505 he was in Florence, and derived a spirit of sympathising with living people from FRA BARTOLOMMEO. Whether the picture which now hangs in the middle of the third gallery was entirely painted before or after the visit to Florence cannot be ascertained. When it formed one of the ornaments of the royal palace at Naples it was usually

spoken of as being in RAPHAEL'S first manner, and there is something Peruginesque in the Madonna. But the figures of St. PETER and St. PAUL are suggestive of incipient power of another kind, and they might well be considered as a revelation of Florentine teaching. It is a marvellous picture to have been produced by a youth of twenty-two, but it would be unfair to RAPHAEL'S memory to compare it with works painted subsequently to 1505.

*The Adoration of the Magi* is another version of the picture in the Dresden Gallery which we once reproduced. In every line is shown the strength of PAUL VERONESE. It is true that a very simple scene has been aggrandised by the painter. But in Venice it was perhaps impossible to make people realise how humble were the beginnings of Christianity. Standing in front of the picture, we must feel that whatever was undertaken by VERONESE, he was competent to treat it, and efficiently. We may object to his interpretation, but we must acknowledge that all he saw either before his eyes or in his mental vision he could depict with consummate effect. His lines have the vigour of a relief in bronze, and his figures are as dignified as if senators served for the models.

In the neighbourhood of such works VANDYKE'S *Sir John Suckling* appears frivolous. The cavalier-poet is represented as studying SHAKESPEARE, having a folio resting on a rock, on which is inscribed, "Ne te quæsiseris extra," advice which might well be followed at the present time. MURILLO'S *Flight into Egypt* is a scene he is likely to have often witnessed—a Spaniard with a broad hat leading an ass on which his wife and child are seated. Two Holy Families, one by PALMA VECCHIO and the other by BONIFAZIO, form excellent pendants, for both have a homeliness which was not always attained in Italian altar-pieces.

We re-enter the secular world with a portrait of DON ALONZO DE CANAMAS, by ESPINOSA, which is very vigorous, and emphasises the gravity of the Spanish noble. By FRANK HALS is a portrait of a lady dressed in black satin with gold braid. She is not handsome, but appears unaffected and honest. JORDAENS'S portrait of Baron WAHA DE LINTER suggests deep potations, which, however, increase good humour. The left hand rests on the hip in a manner that is unusual in paintings, but which, we presume, was taken from life. The landscape by JACOB VAN RUYSDAEL compels admiration by the great groups of trees which form part of it. There is another vivid portrait, a man, by FRANK HALS. A lady in a long red dress is by VANDYKE, but, somehow, the head seems too small for the robe. An Austrian cardinal in armour is by RUBENS. *Las Meninas*, showing VELASQUEZ painting the portrait of a Spanish princess, is amusing if not comic. Mention must also be made of two portraits by REMBRANDT. The whole of the pictures uphold the associations of a gallery where many famous works were visible in past years.

#### RENOVATION OF THE EXTERIOR OF ST. MARY, ISLINGTON.

THE old church dated back to the year 1483, and was taken down in the year 1751. The present church was built in the year 1754, and opened by Mr. J. COLEBROOK, who laid the foundation-stone. It took two and a half years in building. The architect was a Mr. DOWBIGGIN. The contract was 6,319/. It has eight bells in the tower—six were taken from the old church, and two added. Out of all the ancient monuments and tablets in the old church not one has been preserved or handed down. The one to Lady OWEN was a very beautiful work, and no drawing of it now exists; it ought to have been re-erected in the present church. The illustration shows how the exterior could be improved. The side windows to have pediment over and carried up higher, as also in the west elevation, a Portland stone open balustrading carried over the cornice all round the church, the present circular portico taken down and a light and beautiful Ionic portico, at right angles with the wall built, with flight of steps up. The side windows and on the west elevation would be raised with stone ashlar and cornice over the top. The belfry windows would have pediments over. This also includes a new chancel. The church has been allowed to fall into a most shameful state

of dilapidation by the neglect of past churchwardens. The tower and spire, with its white stone quoins, is one of the most picturesque in London, but of course not equal to WREN's Bow Church, or St. Bride's, Fleet Street, in beauty, or DANCE's St. Leonard's, Shoreditch, in dignity. The design is by Mr. R. PAYNE.

WEST ELEVATION.

SIDE ELEVATION.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. John Slater, vice-president, in the chair.

The Hon. Secretary announced the decease of Mr. E. H. Martineau, elected associate 1851 and fellow 1860; Mr. Hugh Leonard, elected hon. associate 1878; Mr. E. W. Smith, hon. associate 1900.

Dr. A. S. MURRAY read a paper entitled

### Two Ionic Capitals in the British Museum.

He said that Professor Meurer, of Rome, visiting the Museum some months ago, identified one of the Ionic capitals in the collection as from the Temple of Wingless Victory at Athens. It was an angle capital from the south-west angle, and was brought over by Lord Elgin, together with some slabs of the frieze. The temple had four Ionic capitals at each end—none along the sides; hence, probably, the later name of the temple, Wingless Victory. The official name was Athena Nikè, which was definitely confirmed some years ago by the finding of an inscription in the form of a public record ordering the building of the temple. The inscription is on marble, and states that the designs were to be left to Callicrates, whose name is familiar as one of the architects of the Parthenon. The date of the inscription is agreed to be not earlier than 450 B.C., but not much later—that is to say, about ten years before the completion of the Parthenon. It does not follow, however, that the work had been put in hand at once. There is another inscription added on the same slab obviously some years later, about 430 B.C. Accordingly, between these two dates, 450-30 B.C., the temple had been built. At the latest it is therefore older than the Erechtheum. In the Elgin Room at the Museum can now be studied an angle capital of the Erechtheum side by side with the newly-identified capital of Athena Nikè. The capital of the Erechtheum is exuberant in its beauty; the other is simplicity itself. The author went on to describe the capital of Athena Nikè, indicating various characteristics in the treatment of the ornament which go to prove its greater antiquity. There is in the Museum a fragment of an angle capital of the Ionic order from the temple at Bassæ by Ictinus, the colleague of Callicrates in the building of the Parthenon. It would be satisfactory if the newly-identified capital could be claimed positively as the work of Callicrates. The Bassæ fragment, however, Dr. Murray considered both simpler and grander in its lines, and there was still the question whether the commission given to Callicrates about 450 B.C. for the Victory Temple had ever been executed by him. Incidental reference was made by the author to a small terra-cotta capital, archaic Ionic, obtained from Gela, in Sicily, two or three years ago, which bears traces of colours—red, white and blue.

Coming to the second capital to be treated of, the author referred to the Ionic capital from the archaic Temple of Diana at Ephesus, described in his paper on "The Sculptured Columns of the Temple of Diana at Ephesus," read at the Institute in 1895. To a large extent this was a reconstruction from fragments of the old burnt temple found under the later one, and fortunately those fragments were enough to enable the reconstruction to be made without recourse to much conjecture. But there remained over some other fragments of capitals from the same archaic temple. As they lay in the Museum room they were almost unintelligible. After much doubting he (Dr. Murray) decided to take certain of them in hand. The author then described the fragments and the ornament upon them, and went on to show, by the aid of lantern slides, how they had been pieced together, the result being a restoration, fairly justified by the remains of an archaic capital of an entirely new character. One particular feature the author did not think there was any other instance of among the remains of Greek architecture. A fragment of the rim presented on the outer face a double moulding with a sharp groove between. Into this groove had been pushed a thin strip of lead which first had been doubled back. The doubled edge is at the bottom of the groove; at the top the two edges of the lead are brought close together and hold in the manner of a vice a very fine thread of gold. Pliny mentions as still existing in his day at Cyzicus a shrine on which a fine gold thread had been inserted in all the joints of the marble, so that the interstices shone with the finest hair-like threads. Fragments from the capitals show that much red or vermillion had been employed on them. Some leaves show a white edging, others white with red edging.

There remain two fragments from the archaic temple at Ephesus which the author thought must also belong to a capital, though it is not yet clear how they are to be combined into one. One shows the head of an ox in very high relief, the other part of his back and haunch, with the tail thrown up over the haunch, as often seen in archaic Greek sculpture. There is in the Museum a huge capital from Cyprus in which the heads and shoulders of two oxen were employed to support

the abacus. The author concluded that if he was right in his assumption that these two fragments belonged to capitals, we have thus at least three types of capitals from one and the same archaic Ionic temple. We have also at least three types of bases, and considering how few are the surviving fragments, no one can say but there may have been other varieties. Pliny says of the later temple that thirty-six of the columns were sculptured. The older temple also had sculptured columns. These enriched columns would be capable of carrying off some variety in the capitals. The moral is that if the architects of the Classical Revival in this country had been aware of the inventiveness of the early Greeks the aspect of our towns would have been very different.

In conclusion, Dr. Murray acknowledged his indebtedness to the foreman of the masons and the well-trained men under him in the various restorations and rearrangements that had been made in the Museum during the past fifteen years.

Mr. HUGH STANNUS added some remarks on the buildings and temples of the Acropolis, and moved a vote of thanks.

Mr. R. PHENÉ SPIERS seconded, Messrs. PAUL WATERHOUSE, BERESFORD PITE, W. D. CARÖE and E. W. HUDSON also spoke.

The next meeting, announced for January 20, will be for the award of prizes and studentships, and a paper on the "Architectural Discoveries of 1901 at Stonehenge," by Mr. Detmar J. Blow, will be read.

### THE BIRMINGHAM GENERAL HOSPITAL.

A MEETING of the general committee of the new hospital, Birmingham, was held on December 31 under the presidency of Sir John C. Holder.

Mr. W. N. Fisher, honorary secretary, presented a report in which it was stated that such had been the care with which the question of additional work or extras had been watched by the architect and building committee that the officers had the gratification to report that out of a total payment of 144,196*l.* to the contractors for buildings and other works the comparatively small sum of 4,434*l.* represented the only additions. The outlay on the work was as follows:—Purchase of land and properties, law charges, &c., 49,288*l.* 9*s.* 3*d.*; payments to the contractors for buildings and other works, including ventilating and heating, electric lighting, boiler and hot-water supply, &c., as certified by the architect, Mr. William Henman, 144,196*l.* 18*s.* 10*d.*; consulting architect, costs of competition, clerk of works and sundry incidental expenses, including printing, advertising, postages, &c., 4,162*l.* 19*s.* 7*d.*; furniture and internal fittings, including theatre and dispensary appliances, &c., 14,273*l.* 8*s.* 11*d.*; architect's commission and expenses, 7,537*l.* 10*s.* —219,459*l.* 6*s.* 7*d.*

The following report from Mr. Henman was presented:—

Gentlemen,—Now that my work in connection with the erection of buildings in Steelhouse Lane is about to be closed, I may remind you it is just ten years since I was invited to submit a design, and venture to recall the principal features in connection with the undertaking. In the printed report which accompanied my drawings I clearly stated that the sum then proposed to be expended would be quite inadequate for a hospital such as was contemplated, and that in my opinion it was best to design a complete building and erect such portions as funds would permit, trusting to the liberality of the public for its ultimate completion. You took a still bolder step and determined to carry out the entire design; the wisdom of that course is proved by the liberal response made to the appeal for needful funds. The hospital has been carried out in all essential features as originally designed by me with one important exception, viz. in the method employed for heating and ventilation. After very careful examination of buildings in which Mr. William Key, of Glasgow, had introduced the "Plenum" system of ventilation combined with steam heating, you decided to adopt his methods and employ his services. Had I realised the enormous amount of additional labour and responsibility which devolved upon me by the adoption of "Plenum" ventilation in so extensive a building I might have hesitated to have given that system its just due when asked to report thereon; but when adopted I spared neither time nor trouble in mastering its requirements and adapting the construction of the buildings so as to insure its permanent success. By adding a storey to the small pavilions the accommodation for patients was increased by forty-two beds, bringing up the total to 346. On November 23, 1892, a tender of Messrs. Barnsley & Son was accepted for the foundations and basement of the out-patients' department, in order that work might be proceeded with on a portion of the site then available. The generally expressed opinion that "Birmingham ought to have a hospital second to none in the kingdom" led no doubt to an expensive class of material being specified; and, as tenders for the complete

work were invited upon a rising market, they came in at a higher figure than you considered ought to be expended. A revision of the design was thus required which entailed several months of labour; for, although reduced cost was principally brought about by the substitution of less expensive materials, minor economies ran all through the buildings, necessitating practically a new set of working drawings and specification, for which I have claimed no remuneration. Although I regret the loss of some architectural embellishments to the back portions of the buildings, I have no such feeling in regard to the elimination of large quantities of glazed brick lining originally provided, having become convinced that glazed brickwork within a hospital is not a suitable material; and, as regards stability and utility, I do not consider the buildings have suffered by the modifications necessitated in order to reduce the cost. Fresh tenders having been obtained, that of Messrs. Barnsley & Son was accepted for completing the works and a second contract was signed on March 12, 1894. The works were continuously proceeded with and the buildings were occupied by patients in October, 1897. During the progress of the works, slight modifications in the design and materials employed were necessitated, and some additional works, principally in the nature of fittings, were required and sanctioned by you. After deducting such additions I was gratified at being able to report that the cost of the works executed under the second contract was 776*l.* less than the contract sum. I desire to take this opportunity for acknowledging the confidence which you have throughout placed in my conduct of the works, and to express my appreciation of the admirable manner in which they were carried out by Messrs. Barnsley & Son and the numerous sub-contractors, as well as to thank Messrs. T. H. Mansell and Charles Henman for the painstaking care displayed in their duties as quantity surveyors.

Able supported as I have thus been in my endeavours, I have no hesitation in stating that you have excellent value in handsome, sound and useful buildings. The science of hospital design may progress, but Birmingham holds the proud position of having at the end of the nineteenth century boldly made a new departure, which has already led to fresh developments intended to secure additional comfort and convenience for both patients and staff, as well as to facilitate the work of administration in these noble institutions, built and supported for the cure of disease and alleviation of suffering among the poorer classes of the community.

The Chairman moved the approval of this report. They were, he said, to be congratulated on having had Mr. Henman as their architect. From the time Mr. Henman submitted his design there had not been a single room altered. That spoke well for the way the work had been carried out. They had been fortunate also in having so few extras. It was almost unique. When they decided to put in the foundations of the out-patient department they roughly estimated that that work would cost 5,000*l.* The tender came in at 4,780*l.*, and the settlement was 4,880*l.* 10*s.* The second contract they roughly estimated at 118,000*l.* and the tender was 117,888*l.*, while the actual payment was 117,581*l.* 15*s.* 11*d.* There was an item of close upon 4,000*l.* for additional work, but Mr. Henman was not altogether responsible for that. It was in connection with the heating and ventilating, the boiler-house and laundry. The small amount of the extras was marvellous. The portion of the total cost for which Mr. Henman had been responsible was 144,000*l.*, and they had very good value for their money. If the hospital had to be built at the present time he questioned whether it would be done for 20 or 25 per cent. more. Mr. Henman had been a most agreeable colleague to work with. He did not think there was a better building or a better arranged and equipped hospital either in this country or abroad. He had seen most of those in this country, and while in America he took the opportunity of seeing what they had there. When he saw their best he was still very much pleased with the General Hospital. There was not one equal to it.

Mr. J. Howard Cartland seconded the proposal, and it was adopted.

A Record of the repairs done to the fabric of Winchester Cathedral has been cut in stone and recently placed in the west end of the nave. It states that the repairs to the roof were begun in March 1896 and finished in December 1898; the cost was 12,670*l.* 10*s.* 11*d.*, and the total area treated 31,973 feet super, or about three-quarters of an acre; weight of lead removed and recast, 156½ tons, put on 197½ tons; weight of new oak, 198½ tons; weight of pitch pine in battens, &c., 326½ tons; length of battens, 93,510 feet, or about seventeen miles. The work was carried out by Mr. J. Thompson, of Peterborough, under the supervision of Mr. J. B. Colson, F.R.I.B.A. A great deal of necessary work on other parts of the roof remains to be done and the repair fund is still open.

## NOTES AND COMMENTS.

ON the last day of 1901 Mr. FREDERICK W. HORN-BLOWER, who was well known in Liverpool, passed away after a long illness. He was the eldest surviving son of the late LEWIS HORNBLLOWER, with whom he was associated in practice for many years. He was associated with his father in the laying-out of Sefton Park, Liverpool, and their joint plans were awarded the second premium when the designs for similar work at Roundhay Park, Leeds, were under consideration. Among their works was an extensive "model" village on fireproof principles at Millom, Cumberland, and the laying-out of a building estate of some hundred acres near Preston. He was also successful in taking the second place with the plans which he submitted in conjunction with Mr. FRANCIS USHER HOLMES for the art museum and library buildings at Dublin, the first place being taken by an Irish architect. Mr. HORNBLLOWER was also entrusted with the execution of a large amount of private work, among others by the members of the LAIRD family, Lord BRASSEY, Sir THOMAS BROCKLEBANK, Sir F. G. HESKETH, Bart., &c. He took a prominent part some years ago in the reconstruction of the Liverpool Architectural Society, of which he was for eight years hon. secretary and subsequently vice-president. Mr. HORNBLLOWER ceased to take an active part in his profession about two years ago in consequence of ill-health. His loss will be regretted in Liverpool and elsewhere.

As far back as 1851 FRANÇOIS-NICOLAS CHEFFLART won the Prix de Rome. To have gained that distinction at a time when there were able rivals might well be assumed as the commencement of a prosperous career. But, like other artists, CHEFFLART was remarkable for his extreme political views. As he was not in favour with the Imperial Government he received no commissions. When the Empire vanished he may have imagined he was to have his chance, but politics got the better of him, and, like COURBET, he engaged in the Commune. On its failure all hopes of commissions from public or private patrons came to an end. He was ignored by all but a few friends, and recently passed from this life as obscurely as he had lived. When the inevitable sale followed, between 200 and 300 paintings and drawings were evidence both of his constant industry amidst many difficulties and of the neglect of the public. They were all disposed of for about 300*l*. A large painting, *The Battle of Cannes*, was purchased by the City of Paris for the small sum of 60*l*., and as it will appear in the new Musée, it may be assumed the value of CHEFFLART'S works will be immediately increased.

STATISTICS are not easily compiled, especially when they relate to foreign countries. It is not surprising, therefore, that the returns of the French Customs Department relating to the Paris International Exposition of 1900 should be so long in appearing. It appears that the value of the objects which were contributed by the fifty-nine countries that were represented in the Exhibition amounted to 250,564,000 frs. The machinery amounted in all only to 26,062,000 frs., while the objets d'art were valued at 190,970,000 frs. It will thus be evident that art in the official sense of the word could claim to possess nearly four-fifths of the total value. In some cases the proportion was still larger. Italian art, for instance, was worth 22 millions of francs out of 26 millions; Hungary 40 millions out of 43 millions; Austria 19 out of 23; England 14 millions out of 20; while German art held the proportion of 9 millions to 23 millions. Germany thus contrived to be supreme in manufacturing industries. Spain is not included in the return, for so many of the works of art were beyond any known market price, a valuation of them was not furnished.

A NEW use has been found for the automobile: By its means large groups in sculpture can be conveyed to their destination without being taken to pieces. This has been

exemplified in the case of the equestrian statue of *Vercingétorix* by M. BARTHOLDI. It weighs about 5 tons, and is to be set up in a public place at Clermont-Ferrand. From its size it could not be sent by canals or railway, and if it were drawn by horses it would be necessary either to take the statue to pieces and to despatch workmen to again unite the parts, or to pay a large sum for a special conveyance. A gentleman who is an enthusiast offered to convey the sculpture by an automobile car of his own. It was necessary to make the flooring of extra thickness and to strengthen the wheels as a preliminary precaution. The conveyance and its load were to be seen in the late Automobile Exhibition in the Champs-Élysées, and as the journey was safely made through the streets of Paris, there seems little doubt that M. BARTHOLDI'S work will reach Clermont-Ferrand without any injury. The experiment is of interest to sculptors.

DURING several years the coast scenes of EDWIN BRETT, A.R.A., were at once recognised in Academy exhibitions. Possessing some geological knowledge he endeavoured to represent cliffs and rocks in a manner which could be appreciated by men of science. In attaining so much accuracy art was occasionally sacrificed, for with so much detail it was impossible to treat large masses with adequate breadth. He also found it necessary, in order to show the peculiarities of his rocks, to restrict himself to representations under strong light. For the same reason his seas were generally either calm or only gently disturbed. But, in spite of the limits he accepted, EDWIN BRETT'S paintings were always welcome to visitors, and, moreover, they were survivals of the pre-Raphaelite endeavour to represent things in all their fulness. On Tuesday the painter's career came to an end. He had reached his seventieth year, but until lately he appeared to have many years before him. His loss will be felt, for by one class of amateurs EDWIN BRETT was esteemed as the most accurate of seascapists, and for the multitude he recalled coasts as they were seen in summer holidays.

It used to be accepted as incontrovertible that the Pantheon of Rome was erected by AGRIPPA in order to form part of his baths. M. CHEDANNE was, however, able to discover that the building dated from about 150 years after AGRIPPA'S time, or in the reign of HADRIAN. It was, however, believed that the site was once occupied by a temple which AGRIPPA had raised. A little book has been written by Mr. JAMES THOMAS (Messrs. SWAN, SONNENSCHN & Co., LTD.), in which it is contended that the circular chamber was first erected in the days of SEPTIMUS SEVERUS. It is admitted that bricks bearing HADRIAN'S stamp may have been found, but it is believed to be possible "that, as material belonging to the ruined building reinstated by SEVERUS, the sound bricks would be used again in a new structure, while the fragments would be ground up for concrete." The Corinthian façade, according to Mr. THOMAS, belongs to the Augustan age, but the building is of a different period. It would appear that the temple was not always kept in sound condition, and the restoration would not be in keeping with the original idea. Mr. THOMAS'S book shows that the references of Roman writers to the Pantheon are sometimes to be distrusted, and if they are careless in one case why not in others? There is much for reflection, therefore, in the pages. But the author is not free from censure, for why did he allow a representation of a part of the frieze of the Parthenon to appear in gold on the cover of a book dealing with the Pantheon?

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. W. H. Seth-Smith, president, in the chair. Messrs. A. D. Thacker and G. M. Page were elected members.

It was announced that the Spring term of the day school would commence on January 13.

The following are recent donations towards the New Premises Fund. The total receipts amount to 3,436*l.* 2*s.* Mr. T. G. Jackson, R.A., 50*l.*; Mr. F. T. Baggallay, 31*l.* 10*s.*; Mr. A. Saxon Snell, 26*l.* 5*s.*; Mr. E. J. May, 21*l.* 10*s.*; Mr. S. Flint Clarkson, 10*l.* 10*s.*; Mr. H. J. Blanc, 10*l.*; Mr. C. Harston, 5*l.* 5*s.*; Mr. T. H. Russell, 5*l.* 5*s.*; Mr. E. Howley Sim, 5*l.* 5*s.*; Mr. B. H. Webb, 5*l.* 5*s.*; Mr. G. B. Carvill, 5*l.* 5*s.*; Mr. E. R. Chambers, 5*l.*; Mr. A. Hill, 5*l.*; Mr. H. S. Noblett, 5*l.*; Mr. A. H. Belcher, 3*l.* 3*s.*; Mr. W. Stewart, 3*l.* 3*s.*; Mr. W. L. Lucas, 2*l.*; Mr. C. M. Armstrong, 1*l.* 1*s.*; Mr. W. J. Devlin, 1*l.* 1*s.*; Mr. A. S. Tayler, 1*l.* 1*s.*; Mr. J. T. Woodard, 1*l.* 1*s.* Mr. J. A. GOTCH read a paper entitled

### The Development of Domestic Architecture in England from the Twelfth to the Eighteenth Century.

The subject is large; so large that one-half of it has filled the four portly volumes of Messrs. Turner and Parker on the "Domestic Architecture of the Middle Ages," and as that work would take, on a moderate computation, four-and-twenty hours to read aloud to you, without any interval for rest or refreshment, it is quite obvious that the view which we take this evening of the subject must be cursory, and confined to but a small part of the whole range of research.

It will be impossible to enter into minute details of style, decoration and fittings, but it may be of interest to show, by means of plans and views, how the stately homes of England grew from their small beginnings, and what were the most important influences which affected their disposition and their appearance. We are accustomed to take the memorable houses of the country very much for granted, each one being characteristic of its own period. What I want to do is to show, if only by glimpses, how these great houses grew, and what relation they bear one to another.

In the present day we should classify the accommodation of a house in three main divisions: the reception-rooms, the bedrooms and the kitchens or servants' quarters. Going back to the times of the early Georges, the same classification holds good, but the bedrooms were less important, and the reception-rooms much more so. Still further back, in Elizabeth's days, the same division is applicable, but we find the chief apartment among the reception-rooms to be the great hall. The bedrooms were largely left to take care of themselves. In all three periods the kitchen department is fairly commodious. But if we go back to the thirteenth or, further, to the twelfth century, the bedrooms practically disappear, and only the reception-rooms and the kitchens remain. Indeed, when we reach these primitive times it becomes necessary to alter our classification somewhat. There are still three kinds of rooms, but they consist of hall, solar and kitchens, the solar being the private apartment of the master or, to use a more appropriate word, the lord. These three rooms are the nucleus from which grew the vast mansions of Elizabeth and Anne, and the development of domestic architecture consists largely of the development of this one single apartment for the lord into the separate apartments which are now provided for each of his household.

There is this initial difficulty in investigating the houses of the early Middle Ages—that most of them have disappeared. They were as a rule built of wood and plaster, only some of the more important being of durable materials. Those which have survived have suffered so many alterations in the course of their existence that their original arrangements are not always to be made out. Nevertheless, from such remains as survive, and from the rare references to such matters as have come down to us in contemporary writings, it is quite clear that houses consisted of, first and foremost, a hall, then at one end the solar or sollere (as it is also called), and at the other the kitchen with its subsidiary apartments. Writing about the year 1180, one Necham, who rose from being the master of the grammar school at St. Albans to being Abbot of Cirencester, enumerates the apartments of a house as consisting of the hall, a private or bedchamber, the kitchen, larder, sewery and cellar.

The houses of that time were comparatively limited in number. There were the king's houses, of which he had a good many in different parts of the country, the houses of the great barons, and the manor-houses. Besides these there were the great religious establishments, which, however, had their own special arrangements, hardly falling within the scope of this paper.

Many of the great barons lived in highly fortified houses which we call castles, some of which were actually military strongholds. In the case of others, it is not easy to draw a

distinct line between the castle and the house, for they were all more or less fortified. But at present it is not the military strongholds which are under consideration, but those dwellings which were only fortified in order to secure their inhabitants. Such a house was the Peak Castle, in Derbyshire, which was built on a steep hillside on a triangular piece of land, protected on one side by one of the numerous and precipitous dales for which Derbyshire is famous, on a second side by the sheer descent of the gorge into which the Peak Cavern opens, and on the third by the steep hillside, at the top of which was the outer wall of the castle. The dwelling part of the castle was the keep or tower, the ruins of which still crown the summit of the isolated piece of land. This keep resembles the pele towers of the Scottish Border, many of which still remain both in Northumberland and in the Lowlands of Scotland. It is a square tower of three or four storeys, each floor containing one room. The basement was a cellar, the floor above it contained the hall, over the hall was the lord's private apartment. This arrangement is very primitive, and represents what must have been the minimum in the way of accommodation which was tolerated. This vertical disposition of rooms, one over the other, soon gave way to a disposition which placed most of them on the ground floor, or if they were not on the ground floor they were spread out into a form less rigidly vertical.

Whatever arrangement was adopted, however, the hall was the chief apartment. It was the largest, the most permanent and the most central. It was, in fact, the dwelling-place of the household, and became synonymous with the house itself, which was in most parishes known as "The Hall." In this apartment the whole household lived, ate and slept; all save the lord and possibly his family, who had a separate room into which they could retire, already mentioned as the solar. The solar appears to have been almost always an upper chamber, built over an apartment which was often used as a store place; but there are so few remains of these very early houses that the exact arrangements can hardly be made out with certainty. The solar seems to have been approached in many cases by an outside staircase. But, at any rate, this much is clear, that the hall stood in the middle, between the solar and the kitchen, the latter being the third of the three main classes of rooms which these early houses contained. The cooking was not done in the hall, but in a separate building devoted to the purpose, attached to which were a few subsidiary rooms such as the larder, where the food was kept; the sewery, where provisions, linen and table furniture were stored; the cellar, which was used for general stores and wine; and the buttery, where the drink was distributed. These smaller rooms were not always provided; their presence depended on the importance and size of the house; but there were always and in every house the three divisions of hall, solar and kitchen, the hall lying between the other two. The arrangement of the hall was simple, and remained the same in principle from the earliest times down to the seventeenth century. It then underwent a change which marked a complete revolution in domestic architecture, and which will be described in due course.

The hall, lying, as already said, between the solar at the upper end and the kitchen at the lower, was entered, close to the latter, by a door in its side wall. Through the lower end wall were doors leading to the kitchen department, sometimes two, sometimes three. Of these, one opened into the buttery, one into the kitchen or kitchen passage, and the third (if there were a third) into the pantry. There was usually a screen stretching across the hall to keep off the draught from the open door, and more particularly to screen off the kitchen traffic, for draughts would still come through the windows, which were seldom glazed in early times. There were doors (generally two) through the screen into the hall itself, and there was a ceiling to the passage cut off by the screen, which formed a gallery usually known as the minstrels' gallery, although it is tolerably certain that very few of the ordinary households could have supported a private band. At the end of the hall, away from the screen, was the dais, which was a raised platform some few inches high, whereon the lord and his family and principal guests sat to dine. In this upper end of the hall was a doorway leading more or less directly into the solar. Both the solar and the kitchens were sometimes built of wood, as were also many of the subsidiary apartments. Such fragile buildings have disappeared, leaving in some cases little besides the hall to tell of the former extent of the house. This may have been the case at Oakham Castle, where the hall alone remains of the building erected about the year 1180 by Walkelin de Ferrers. But this hall is an extremely fine example of its kind; it is of considerable width and the roof is carried in three spans, one over a central nave and the other two in the shape of a lean-to against it—an arrangement similar to that adopted in churches, and serving to remind us of the similarity of treatment adopted in both ecclesiastical and domestic buildings. The windows are small and low down, and they have, in common with the doorway, the characteristics that distinguish the transition from Norman to Early English. The interior might well be taken for that of a church, with nave

and aisles, but the position of the doorways in the end walls, the treatment of the windows on the inside, as well as the absence of any indication of a chancel, would put the wary inquirer on his guard. The hall stands alone, the solar and kitchens—which must have existed—having disappeared. It may be that they were burnt, for accidents of that kind happened not infrequently. One, indeed, happened in 1182, two years after this hall at Oakham was built, to no less a person than Abbot Samson of Bury St. Edmunds, who, we are told, was nearly burnt to death in his solar, the only door being locked and his Early English windows being too narrow to admit of his getting through them.

If not burnt down these rooms may have been blown down, as were the royal kitchens at Oxford in the seventeenth year of Henry III.

It seems quite clear from these and other specific references that many of the subsidiary rooms were built of wood, although the hall was of more durable materials. Its permanent character arose from the nature of its use. It was the sheltering place of the whole household. Temporary kitchens might be and sometimes actually were erected, so might a temporary bedroom. But in the hall the family and its retainers ate and slept; in it also the lord held his courts and received those who came to see him on matters of pleasure, of business, or of strife.

Personal comfort was not much studied in those days; men were content to sleep where they could, and when there was no room in the hall they sought, without reluctance, the equally refined shelter of the stable. There was no indignity put upon Ivanhoe in sending him to the stable; his fellow-knights often shared his fate in this respect. A little after his time we learn that Henry III. ordered the wood-cellar at Clarendon to be fitted up as a chamber for the knights in attendance on him. As they were not particular about their beds, so also they had simpler views than we have about the heating of their rooms. In some houses only the solar had a fireplace; the hall was heated by a fire in its midst, the smoke finding its way out of a louver in the roof. Here and there the hall had a fireplace of its own. The smoke from the central fire found other vents than the louver, for but few of the windows were glazed; wooden shutters served to keep out the weather. In some grand houses the part above the transome was glazed, while that below retained its shutters. But people were susceptible to draughts even in those hardy days, for Henry III. directed a window in the queen's room in the tower to be glazed, "so that the chamber might not be so windy."

It was in his reign, too, that the practice of wainscotting rooms—that is, lining the walls or the roof with wood—was introduced, and there are several instances in which he ordered a certain number of bays of a roof to be wainscotted, presumably in order to keep the draught from his own head and those of his principal guests.

But I must not enter too much into details; these matters have been mentioned rather with the view of showing how small an amount of what we call comfort was expected in those days, and how, therefore, it is not surprising that very few rooms satisfied the domestic needs of the times.

At Stokesay, which was built in the thirteenth century, the main dispositions conform to the usual type. There is the large hall entered at the end of one of its sides. At its upper end is a door which eventually gave access to an outside staircase leading to the solar. At its lower end is a cellar, over which is an apartment with a fireplace. This room was reached by a staircase in the hall, standing in what would ordinarily be the screens. Of the kitchen there do not appear to be any remains. Beyond the upper end of the hall is a tower which was used for defensive purposes, upon the particulars of which it is not now needful to dwell. The details of the work are characteristic of the thirteenth century. The hall windows are of two pointed lights surmounted by a circle. The lights, which are divided horizontally by a transome, were provided with shutters, but the circle was apparently always open for the winds of heaven to blow through, and doubtless it was through them that most of the smoke from the central hearth escaped.

Yanwath or Yanwith Hall, in Westmorland, was built early in the fourteenth century, but underwent considerable alterations in the sixteenth. The same arrangement was adopted here as in the former examples. The great hall was approached through a passage, which was enclosed by a stone wall on both sides instead of having one side formed by the wood screen of the hall. On the left of the passage was the kitchen, on the right was the hall. The hall itself had a fireplace instead of a central hearth, and this fireplace was at the lower end of the hall. In later times it was more usually placed near the lord's end. There is also a bay window, a feature which became subsequently of universal adoption. The solar, in this instance, is developed into several rooms, situated in a tower, and exhibiting the usual characteristics of the accommodation of a pele tower, namely, one fair-sized room on each floor surrounded by thick walls, in which are

contrived various diminutive apartments, access being obtained from floor to floor by means of a narrow newel staircase.

In addition to the usual accommodation which has hitherto been mentioned, Yanwath had a number of other rooms arranged so as to form an enclosed courtyard, one side of which has, however, disappeared. The entrance to this courtyard was through a gateway nearly opposite to the hall door. This courtyard idea, which arose from the necessity for defence, lingered on, as we shall see, for reasons of appearance, long after the need for defence had ceased.

At Sutton Courtney, in Berkshire, is a house, built about the middle of the fourteenth century, in which the usual disposition of rooms is again found. The hall is entered at one end through the screens, and the roof is made to agree with the framing of the screen itself. At the lower end is a doorway which led to the kitchens; at the upper end is a wing which contained the solar on the first floor, reached by an external covered staircase. There is no bay window, but it is worthy of note that below the main window at the dais end is a low side window, probably contrived for the pleasure of the occupants of the dais. In later times, while the hall windows were almost invariably high up from the floor, the bay window of the dais was equally invariably brought down low enough to afford an outlook. The lofty hall roof still remains (or remained when Turner and Parker wrote), and the general character of the work led to the hall being called the chapel, another illustration of the widespread, but fallacious notion that Gothic forms must of necessity indicate a religious edifice.

The hall itself was usually a lofty building, with an open-timbered roof. It divided the house into two separate halves, which, if they were of two storeys, had to have their own separate staircases. The walls of the hall were often plastered, and for ornament they were hung with the spoils of the chase, or else with pikes, guns and bows, with old swords and bucklers that had borne many shrewd blows. A good example is to be seen at Cothele, in Cornwall, and also at Haddon Hall, where the fifteenth-century wood screen still remains.

Haddon is a fine example of a large fifteenth-century house built round two courts, and still exhibiting a considerable desire for defence. The hall, as was usual in double-courted houses, was placed in a wing between the two courts, thus being in the most central and best-protected position. It was flanked, according to the usual custom, at one end by the buttery, pantry and kitchen, and at the other by the family apartments, hitherto confined to the solar, but now developing into the parlour and other rooms, including a number of separate bedrooms. This plan of Haddon shows the great chamber and the long gallery, but it should be remembered that the great chamber was probably not so called prior to the sixteenth century, while the long gallery was contrived over the walls of a number of earlier rooms, towards the close of that century. The kitchens here are much more elaborate than in any of the previous examples, and they go to show that the wants of a large household and a hospitable lord were both great and permanent, and not so liable as in ancient days to interruption from hostile visitors.

The possibility of such interruptions was never absent from the minds of the builders of those days. Houses were nearly always surrounded by a moat where the nature of the ground permitted it. The entrance gateways still followed in many cases the ancient fashion of placing an archway between two towers. The courtyard plan still held the field in houses of any pretensions. As the years went on the character of the ornament changed just as it changed in churches. The tracery disappeared from the windows, which became flatheaded; doorways likewise became less aspiring, and assumed the obtuse angle of the Tudors. Fan tracery made its appearance in various places, such as the ceilings of bay windows and porches; circular stairs were placed in turrets, which were carried up above the main block of the building and crowned with lead cupolas. The splendid brick chimneys of Henry VII. made their appearance, with all their intricacy of cut and moulded brickwork.

Then came the Italian influence, which first made itself felt in unimportant ornament and then spread to shaping the building itself, reducing it to symmetry so far as the exterior was concerned, but leaving the interior still to be arranged after the old fashion.

It brought also that exotic feature, the loggia, or open arcade, which, however, never obtained a really firm footing in English houses. Indeed, all through the sixteenth century and the first quarter of the seventeenth, the new Italian influence never overmastered the old irregular English habits. But under the accomplished Inigo Jones, as we shall presently see, symmetry, which had hitherto been kept to the outside of the house, invaded the inside as well.

However much the character of the ornament may have varied, the character of the plan moved but slowly and always in one direction. Haddon and Apethorpe, two large houses, have shown how the old type grew at its two ends, the hall remaining as of old, but the kitchen and the private apart-

ments undergoing considerable increase and development. On a smaller scale Canons Ashby tells the same story. So do the plans of Elizabeth's time, such as Canons on a small scale and Kirby on a large scale, both taken from Thorpe's book. In looking at these plans it is obvious that the old idea is still the foundation of the arrangements, although in a great place like Kirby the accessory apartments have become vastly multiplied, and all thought of defence has been abandoned. Houses are no longer built for safety, but for show. Windows which once were sparingly introduced into the outside walls, that is, the walls looking out on to the country, are now used without restraint, and are regarded quite as much from the point of view of how they will help the composition of the design, as from that of usefulness in lighting the rooms. Cheerfulness, splendour, comfort (of a kind), these are the qualities now sought after. The hall had long ceased to be used as a sleeping apartment; when the family and servants retired to rest, it was left to Puck and the fairies, to Oberon and Titania and their train, who

Through the house give glimmering light  
By the dead and drowsy fire.

It was not always used even as an eating place, at least by the master and mistress and their family, for many families had already sought a smaller and snugger room for their meals, where they could enjoy more comfort and privacy. Not only had the ancient solar developed into the parlour, but the parlour had been developed into the summer parlour, the winter parlour and the dining parlour. It was no longer on the upper floors, but close to the hall on the ground floor. It was no longer the only bedroom, for bedrooms had been indefinitely multiplied, and, under the name of "lodging," fill up any space in old plans to which no more fitting name could be given. The solar had still further developed. In addition to the parlours on the ground floor, there had arisen the great chamber on the upper floor, and the long gallery—that feature peculiar to Elizabethan houses.

The finishing and embellishment of these rooms had developed along with their number. In the days of Henry III. we hear of plastered walls and wainscotted walls and roof, but the rooms were extremely draughty, and the smoke from the central fires must have been almost intolerable; there was, indeed, no great inducement to abolish draughts so long as the smoke hung about the room. But the discomfort of draughts and smoke gradually told, even on the iron constitutions of Mediæval knights, and by degrees fireplaces with a special flue for the smoke grew more common and the smaller rooms were furnished with them. Draughts were excluded by filling the windows with glass, and later by plastering the ceilings as well as the walls. Indeed, the ceilings were plastered more frequently than the walls, which were usually covered either with tapestry or with panelling. The plaster on the ceilings was not kept plain, as it usually is in our days, but was worked into an infinite variety of ornamental patterns. Indeed, by the period at which our story has now arrived, the fitting up of rooms had reached a point of development beyond which we have not gone very far. We have introduced a number of refinements in detail, but with the exclusion of the weather, the furnishing of a means of heating and the embellishment of the walls and ceiling, our ancestors of Elizabeth's time had really surmounted the chief difficulties of making an individual room pleasant. Its relation to the general scheme of the house is another matter.

Down to the end of the sixteenth century, and, indeed, as far as the first quarter of the seventeenth, the old type of house-plan was still used—the old type which had prevailed in the days of the Norman kings. It is true that the ancient idea had been greatly developed; the kitchen department had been so much enlarged as sometimes to require a court to itself. The single private room, the solar, had been multiplied into several parlours, the great chamber, the long gallery and many "lodgings" or bedrooms. But the hall still remained the centre of household life, and the *daïs*, which indicates its use as a living-room, is shown on nearly all the plans in Thorpe's book. This enormous development of household convenience and comfort would, of course, have been impossible had the first idea of the builders been, as of old, to secure safety; but it was not, and as the certainty increased that a man need not depend upon his own efforts to preserve his security, but the public authorities, so he found more leisure to attend to his comfort, and for securing greater privacy for himself and the members of his household. The great hall began to feel the influence of this change; it had long ceased to be used as a sleeping apartment, and now it ceased to be used for meals. The family withdrew at one end, the servants at the other, and it became merely a vestibule. Concurrently with this change of use there went a change of idea in planning. The symmetrical disposition of houses which the Italian influence produced demanded that the hall should be central. Long-established custom demanded an entrance at one end of the hall, in the "screens," which,

therefore, could not be in the centre of the façade. There are a number of examples, both in Thorpe's plans and in actual houses, of how these difficulties were surmounted. But when the hall was no longer wanted as a living room, there was no longer need for the entrance to be in its old position at the end, and the imperious demands of symmetry were satisfied by placing the hall in the centre of the façade and the entrance door in the centre of the hall. This point is curiously illustrated by comparing Thorpe's plan of Aston Hall with that of the house as built. Thorpe shows the door in the old-fashioned situation at the end. It was actually built in the centre, and the hall here definitely ceased to be a living-room and became a vestibule. This change is a momentous one; it brings us out of the Mediæval idea into the modern.

But although at Aston the plan shows a new departure so far as the hall is concerned, it still follows the old lines in its general grouping, and so does the external appearance. The triumph of foreign fashions over native was, however, near at hand, and it was Inigo Jones who brought it about. At Raynham Hall the plan is no longer founded on the old type. The hall is not the chief apartment, with the family at one end and the servants at the other. The latter have descended into a basement, and the whole ground floor is occupied by family rooms. Traces of the old fashions remain in the projecting wings and in the gables with which they are roofed. But in Coleshill, another house of Inigo Jones, the foreign influence is even more marked, the plan is still more symmetrical, the elevations are still more Classic. In neither house are the windows mullioned; they have sashes, and the change from mullions to sashes marks the final disappearance of the last traces of Mediæval treatment.

The lesson in foreign fashions which Jones gave his countrymen was continued by Wren, and bettered by his successors in the eighteenth century. At Raynham and Coleshill one cannot help thinking that the snugness of home is sacrificed to the demands of stateliness; but at Blackheath and Kedleston it is lost altogether, and the inhabitants of those great houses must daily pay a penalty inflicted by grandeur. The component parts of the house are divided into separate blocks with tiresome corridors of communication. The great houses of the eighteenth century make a brave show, but they exhibit a profound scorn for the small amenities of household life. They were built in an artificial age, and like the huge wigs which their builders wore as an indispensable part of their costume, they were intended rather for the admiration of the beholder than the comfort of the owner.

But the pursuit of comfort, which was the propelling force in all the changes of domestic architecture which we have been tracing, although it was neglected by the great in the days of Anne and the Georges, was still followed by persons of humbler ambitions, and in the smaller houses of the eighteenth century there is much that is admirable. Much skill and care was expended upon their internal embellishment, and the woodwork of that period is always worth our careful study. This is not the occasion upon which to enter on a minute description of the respects in which it differed from that of Elizabeth's time; this only need be said, that it followed the general tendency of domestic architecture in adopting largeness of scale and dropping minuteness of parts. The two examples from Wilton House and the Brewers' Hall will be sufficient to indicate the change of treatment.

This long story must now come to an end. It has not dwelt much on details; it has rather sought to show by means of actual illustrations, as distinguished from mere assertions, that our domestic architecture has undergone a real process of evolution, and that it has reflected, as indeed one might suppose that it would, the habits and wants of well-to-do English people. The feudal lord, surrounded by his retainers, was satisfied with one great room for his household, a small room for himself when he desired rest and privacy, and a place to cook his food; the more important added to these a chapel. These few rooms were securely placed behind a surrounding wall. The feudal lord's Elizabethan descendant was no longer concerned about the safety of his household. This had increased in number rather than diminished, and while the courtier of the Virgin Queen still kept the old hall of his forefathers, he added a vast array of rooms in one direction for his household, and in another for his great guests and their retinues. His descendant of Queen Anne's time no longer made even the pretence of living in the midst of his household. His servants were banished to a basement or a distant wing, and his chief concern was to have stately halls for the reception of his guests, after whose departure he and his family sought the seclusion of such rooms as were of a reasonable size. But just as these habits were of a slow growth, so the changes which they wrought in the houses were quite gradual. A continuous thread runs through the whole series from the Conqueror to the Georges, and the vast palace of Blenheim can trace its origin back to the lonely little tower perched on the hill above the Peak Cavern at Castleton.

Mr. J. DOUGLASS MATHEWS proposed a vote of thanks to

Mr. Gotch. Mr. H. H. STATHAM seconded. Messrs. ARNOLD MITCHELL, G. M. NICHOLSON and N. F. BARWELL supported the motion.

### ARCHITECTURAL OUTLOOK IN AUSTRALIA.\*

IN giving a ten minutes' impression of the outlook of the architectural profession under the Commonwealth it can safely be anticipated that under federation the general advancement of the whole of Australia will be helped forward and the natural advantages of various parts be more generally known. It can also be assumed that the leading position occupied by Victoria will be maintained, and this may possibly be greatly due to the climatic as well as geographical advantages it possesses. Anyhow, I anticipate that the members of our profession here will hold their own, and their works compare favourably with those of other parts of Australia.

Unfortunately, there has been in the past a feeling that cheapness and showy appearance was the principal matter to be observed, and a more substantial class of work generally has been erected in adjacent States. Personally, I am pleased to find that there is an improvement in this feeling, and I anticipate that with a more settled political condition there will be a better class of buildings erected in the future.

Unfortunately, at the present time there is such uncertainty in commercial circles as to the results of federation, and the present proposals for taxation, that it prevents many building operations from being carried out, which we all devoutly look forward to; but in spite of the political gentlemen who so readily undertake to manage us, the natural resources of Australia must be rapidly developed, and thus give opportunities for the employment of architects in the practice of their profession.

The man who has been properly trained, and who, while not posing as a genius, has artistic feeling combined with the necessary knowledge of mankind to deal with clients and workmen, will get a fair proportion of this work, and I cannot see that the new conditions will alter the fact that it is not all luck which gives one man more commissions than another.

Unfortunately there is the difficulty to be faced that there is even at the present time a great scarcity of really good workmen in nearly all trades—many of these men have left Australia. I have found them engaged in country pursuits, and the attractions of that life are sometimes sufficient to prevent them returning to their trades, although their present earnings are less. And apparently there is not that system of training for young tradesmen which warrants us looking forward to their being able to fill the places of those who have gone, or who must, from natural causes or the result of decisions of wages boards, cease work at a time when all their experience would be for the production of quality of work if not quantity.

While I have great admiration for the efforts made in the training which may be imparted at the working men's college, or the various technical classes of schools of mines, this alone will not give that practical and methodical experience which we want in the men who, however good the architect may be, must carry his ideas into practical form. I am in hopes that in time the workmen—and I mean skilled tradesmen—will come to the conclusion that a trades' hall should be instituted for other reasons than that of reducing hours and increasing wages, and that they should formulate schemes for proper systems of apprenticeship, which are the best means of training men to carry out the class of work which we as architects would like to see.

The great possibility of work in connection with the formation of a federal capital will possibly be looked forward to as being in the immediate future. I sincerely trust this may be so, but it must be remembered that even supposing that the site was decided on at once, it will take many years before the preliminary work of water supply, roads, &c., could be completed, and it may be that the younger members of the profession can anticipate the fees they are likely to earn with more enthusiasm than I personally am able to. In connection with the erection of the various State and departmental buildings which will form a great part of any federal city, it is to be hoped that their character will not be cramped by the possibly natural desire of those in permanent Government positions to keep the ordinary struggling architect out of it. I hope that the erection of these works will be open to members of the profession who are outside this charmed circle. In England, during the last few years, a wonderful improvement and development has taken place in the character and magnitude of Government buildings, and in nearly all cases the Government has availed itself of the experience and ability which has been shown by architects in private practice, and I am, I think, safely within the mark when I maintain that if architects were given the same facilities here, they would prove themselves as capable as those of other countries

in carrying out similar works, and I am confident that under private management an equal class of work could be carried out for far less than it costs under departmental administration.

I do not think there is any profession which depends more on the general advancement of a country than that of an architect, and his success and that of the builders and workmen go hand in hand. Unfortunately, no amount of energy on the part of an architect will induce clients to build unless they want to, and our greatest hope for the future is that under federation the progress of Australia will advance by leaps and bounds, and that this will be on a sound basis, where people will accumulate wealth and spend it in building.

### A COPTIC MONASTERY.

PROGRESS in a dahabeah on the Nile is determined now, says a correspondent of the *Scotsman*, as it was in the days of Menes (5,000 B.C.), by the wind. You are lucky if a contrary wind stops you at a place where there is some object of interest, some little known group of rock-hewn tombs, some graveyard of the men who lived long before Agamemnon, or some place of worship of an early faith. At present we are wind-bound at a reach of the Nile where progress up-stream is impossible without a north-east wind, and to-day a small gale has been blowing from the south-west. It is Christmas Day, and the temperature at mid-day was 81 degrees. In the neighbourhood there are no very early monuments, but within half a mile rises a wall of limestone rock some hundreds of feet high above the river bed. Scarred and serrated, with deep fissures, it marks the old course of the Nile in ages before the First Dynasty. On its highest point stands one of the earliest Christian churches, which still remains almost exactly as it was in the days of Constantine. The plateau itself is not without interest. The limestone has been quarried here and there from the days of Rameses III., and probably earlier, and the work still goes on. There are two curious legends about the place; one of prehistoric antiquity, the other Christian. The former is that all the birds of Egypt were wont to assemble here once a year. They then selected one of their number who should remain here till the following year, and the others flew away into all parts of Africa till the anniversary, when they returned and appointed another guardian. The Arabic writer Al. Makrizi gives another version. According to him:—"At one point of the hill is a narrow fissure, and on the saint's day of the convent all the bukir birds in the neighbourhood come flying to this fissure, flocking together in a huge crowd and making a tremendous din. One after the other in constant succession thrusts its head into the cleft and utters a scream, until one comes whose head sticks fast and cannot be withdrawn. The victim then beats its wings against the rocks until it dies, after which all the other birds depart and leave the rock in solitude and silence." The "bukir" bird is described by another Arabic author as "black and white, with a black neck, ringed near the head, black wing-feathers, and the ability to swim." Maspéro identifies the bird with the heron (*Ardea bubulcus* of Cuvier). He notes that the same tale is told by many other Arab writers, and that "it faintly recalls that ancient tradition of the cleft at Abydos, whereby souls must pass as human-headed birds in order to reach the other world. The Christian tradition is that the mountain bowed down in worship before our Lord, that He grasped it with His hand as it worshipped and set it back in its place, and that the mark of His hand remains on it to this day. The name of the hill is Gebel el Ter, while the monastery recalls the tradition of the birds by its name, Der el Bukêr.

Whether it was regarded as a holy place before the fourth century is unknown, but there seems to be no reason to doubt that the Empress Helena founded the church and monastery which remain to this day. In Egypt you are so much in the habit of seeing antiquities of all sorts, from Pyramids to necklaces, which date from 5,000 or 6,000 years ago, that a building which can boast of an antiquity of no more than some 1,500 or 1,600 years comes to be regarded as a modern structure. Visitors to the Empress Helena's foundation are now few. Those who travel by the tourist steamboats are hurried past this as well as many other interesting places, while those on dahabeahs are loth to lose a good wind on the upward journey, and have probably got too many areas of sight-seeing on their way down-stream to spend the necessary day on anything later than the work of the Ptolemies.

Until quite recent years the Nile flowed close by the cliff on which the monastery is perched. A shaft with a rope and windlass went down inside the rock some hundred feet or so, and it was the custom of the lay brethren to descend this shaft and swim out to passing dahabeahs to demand "backsheesh." The Coptic patriarch has forbidden this practice; but an alteration in the course of the Nile, which for nine months of the year now leaves a broad stretch of rich land at the foot of

\* A paper read by Mr. Chas. A. D'Ebrow, F.R.V.I.A., at a meeting of the Royal Victorian Institute of Architects.

the rock, has probably been more effectual in stopping the undignified proceeding than the commands of the ecclesiastical superior. The shaft, too, is now replaced by an easy staircase of about 100 steps, and up and down these there passes all day long a string of labourers, women carrying water-jars on their heads, as well as cattle and donkeys, who seem to find the staircase as convenient as do bipeds.

At the top of the staircase a short incline leads you to the wall which surrounds the church and dwelling-places of the community. There are at present fourteen monks, but a good-sized village, peopled by lay brethren with their wives and families, has from time immemorial been gathered round the little sanctuary. In the days of Moslem intolerance these walls were very necessary for the Coptic communities in Egypt, and here the general appearance of the whole place reminds you more of one of the old Provençal fortress towns than the seat of a religious community.

The houses are but huts, the streets narrow alleys—none of them straight—and the buildings, except the church, are without architectural interest. A crowd of the inhabitants appears at once, curious, but, for the present, silent. Two or three are monks clothed in flowing black robes and wearing black turbans; the rest are women with their veils drawn across their faces, young men glad of an excuse for a holiday, and some dozens of children. The monks are striking-looking men, tall, lean ascetics, with straight, high features and those long almond-shaped eyes which have come down to them from the days of the first Pyramid builders. A living proof, it seemed to us, of the fact that the Copts are of the oldest race which has inhabited Lower Egypt. Here there seems to have been no mixture with a darker people. The skins of all are brown, of course. What else could they be after centuries of exposure to an Egyptian sun? But it is essentially a race of white men. A race, alas! that has been persecuted and oppressed for centuries, but which still preserves, along with much superstition and many irrational observances, the Christian faith which St. Mark is said first to have preached at Alexandria.

We are conducted to a small square on one side of which is the ancient church. The present entrance is on the south side, near the east end. At the west end was the old doorway, now built up, but still showing the carved lintel and posts. The carving of these appears to be of later date than the rest of the church, and the door might be the work of the seventh century. None of the guide-books give any detailed description of the church, and Curzon, in his "Monasteries of the Levant," does not mention this disused door. Whatever the date, the carving is Byzantine in character, and the interlaced patterns have a certain likeness to Celtic work. The church itself is partly rock-hewn. It is said to be "built in the recesses of an ancient quarry." The north and south walls are solid rock. There are no transepts, but an apse with rock-hewn pilasters with rough Græco-Roman capitals. The church is in the form of a basilica, as is usual with those of the pious Empress Helena's foundation. On entering you descend a few steps and reach an aisle about 10 feet wide. This aisle runs round the south-west and north of the nave, and thus an inner square is formed in front of the sanctuary. The dividing columns are octagonal and of great strength and thickness. Above is a sort of clerestory, and the whole nave is surmounted by a dome, of later date than the rest of the church, with some rude decoration on its sides. The only light in the church comes from this dome—there are three small cupolas over the sanctuary, but they are of brick or stone plastered inside and out. The screen in front of the altar is of poor workmanship, very different from the marvellous inlaid screens which still glorify some of the Coptic churches in old Cairo. Above it are some poor pictures in pseudo-Byzantine style. A Madonna and Child in the centre might almost be a bad copy of a Cimabue. St. George and the Dragon are there, of course, as in nearly every Coptic church. Formerly the monastery possessed some valuable Arabic MSS. and some old Coptic books. These have been sold years ago when poverty was most pressing. Latterly times have somewhat improved with the monks, and though they show no signs of affluence or even of comfort they possess lands and flocks and herds. After the church had been thoroughly examined we suggested to our dragoman the desirability of taking a photograph of the interior. He had no hesitation in ordering the monks out of the way of the camera or in driving the lay crowd out of the building altogether. This was necessary, as the dim light required a long exposure. In the bright sunshine outside there was no difficulty in getting photographs of monks and laity alike—all of them were delighted, and posed at once in picturesque groups and in dignified attitudes. A donation to the monk who had done the honours of the shrine raised a cry for "backsheesh," which never ceased while we visited the neighbouring graveyard on the desert plateau. The children regarded the whole thing as a great joke, and fled from the wrath of the dragoman, only to reappear over the edge of rocks like a lot of rabbits. To geologists the whole plateau is interesting. The limestone is full of shell-fragments—num-

mulites are so abundant that it is almost impossible to pick up a piece of stone which is not full of this large foraminifera. Remains of various bivalves are also to be found in quantities, and the theory that the sea once flowed up to the first cataract receives ample proof.

After taking some more photographs of the outside of the church and village, and another of a group of the younger inhabitants, and after satisfying to a small extent some of the many claimants for backsheesh, we went down the staircase again to the Nile valley, followed by a string of cows, who tripped down the steps with the delicacy of Agag.

## THE FEDERAL CITY.\*

IN placing this paper before you I wish, at the outset, to preface it by a few explanatory remarks. In the first place, this meeting of architects and surveyors has been called for the purpose of arousing if possible some genuine public interest in the subject we are about to discuss. Mr. Knibbs in his exhaustive and scholarly paper read before the Royal Society a few weeks ago, treated the subject admirably from a high academic standpoint. I have only ventured to approach it from the standpoint of the man in the street.

The necessity for a Federal capital offers us an occasion to achieve distinction by founding a city that may be made almost perfect with regard to its planning. Almost perfect, for though ever since the earth was first peopled men have been building cities for themselves, we have not yet arrived at anything like an absolutely perfect plan. And we probably never will, for the best scheme we could devise to-day must necessarily be imperfectly adapted to the increased requirements of those who come after us, unless all human progress is to cease. As it is now so it always has been, though perhaps in a lesser degree, for the onward march of civilisation is hourly becoming more rapid and more insistent. Every other city, with the exception perhaps of Washington, has grown naturally and gradually about the primeval settlement formed at first by a few pioneers attracted thither generally by some commercial or industrial motive. They were not always careful to select the best site for their embryo town—in fact it seldom or never occurred to them that they were forming a town—they were quite satisfied that they had chosen the spot best suited to their purpose. They only made such necessary arrangements for general convenience as their simple wants and limited knowledge could suggest; matters of hygiene and æsthetic questions troubled them not at all. Even where some slight consideration for posterity was shown, it was not always possible, for practical or other reasons, to carry out the original intention. Let one illustration suffice for all.

As perhaps many of you are aware, it was intended by the first Governor, Arthur Phillip, to make the principal streets of this city of ours 200 feet wide, and only one house was to be allowed on each allotment. These allotments were to have been of 60 feet frontage by 150 feet in depth, to preserve uniformity in the buildings and to provide against narrow streets. But even the autocratic Phillip was unable to realise his ideal. To carry out his scheme would have required more men and money and greater facilities than he could command, and there was other work to do. In the meantime his people required some better shelter than their tents afforded, and one by one temporary tenements were erected on any spot the builder chose to select; the little settlement climbed slowly up the hill-side; rough bush tracks in time became roads; by-and-by houses of a more substantial character arose, and vested interests grew with the growth of the town through the successive administrations of Hunter, King and Bligh, and it was not until Macquarie assumed the reins of government in 1810 that any strenuous effort was made towards laying out the streets. But Macquarie himself—that Botany Bay Augustus, who found Sydney a village and left it a city—was powerless to undo what had been done, and hence the narrow crooked streets of that early time exist to this day in a part of our metropolis lately resumed by the Government, that unsavoury region known as "The Rocks." If I may be permitted to be a little discursive I would like to say that, as an integral part of a great city, this area is, of course, hopelessly impossible; but it is, nevertheless, wonderfully picturesque in its squalor and astonishing disregard for anything approaching system in the arrangement of its streets; and it is, moreover, a place that should be of absorbing historical interest to all Australians, for it is the veritable cradle of the Commonwealth.

What is true of Sydney is true of every other town. As an American essayist has pointed out, this lamentable want of system on the part of our forefathers lends to many cities a

\* A paper recently read before a joint meeting of the Institutes of Architects and Surveyors of New South Wales by Mr. John Barlow, F.R.I.B.A., president of the Institute of Architects of New South Wales, and published in the *Building, Engineering and Mining Journal*.

charm without which they would be for the most part utterly uninteresting. This contrast between the old and the new has something more than a merely picturesque value, for it writes the history of a people in the streets of their town. And there should always be some traces of a history. The studied, foredoomed, regular irregularity of Washington never can appear to be anything but an artificial and formal appointment with which history and growth had as little to do as with a diagram of Euclid. Our new city cannot be of natural growth; it is being forced into existence for a special purpose, and if its arrangement boldly proclaims that purpose we may rest satisfied that we have done all that can be expected of us as far as the future historians of cities are concerned. I think in our Federal city we should not go beyond this. Let us do the best we can to meet our present requirements, and let us attempt no more. We know the needs of our own day; we cannot hope to forecast those of fifty years hence. The most we could have wished Phillip and Macquarie to have done for us was to have provided us with wide streets at convenient distances apart and of a comparatively easy gradient. And posterity will demand no more of us. I very much doubt whether they will thank us for the wide streets. For it hardly needs the gift of prophecy to foresee that all horse traffic will be banished from our cities before this century closes. We know more of aerial navigation now than we did of steam locomotion one hundred years ago, and yet who could have dreamed in the dawn of the nineteenth century that electricity—then but the plaything of science—would before that century ended be slowly but surely superseding steam as a motive power, that it would revolutionise the commerce of the world and add so materially to the things which make life worth living? Who will be so bold as to say that electricity itself will not be superseded, or at any rate applied to the requirements of mankind in a radically different manner before the next hundred years have passed over our heads?

Our business is to create a Federal city, the seat of the Government of the Commonwealth. The population must at first be small and migratory. We will have primarily to provide the necessary buildings for the use of the Federal Parliament, the Houses of Parliament, post office, custom house, law courts and Governor-General's residence, probably some twenty buildings altogether; and in addition to these, space would be needed for libraries and art gallery, theatres, churches, hospital, markets, baths, abattoirs, public gardens, recreation grounds and cemeteries, &c. Then we would have to provide for the accommodation of, say, 20,000 people, and the shops, &c., required for their use. We must give them room enough, and every luxury must be at hand; for it will be, if I mistake not, a summer city—a city, not of commerce and manufacture, but of pleasure. But all this, even when ample allowance is made for the circumstances under which we will assume the inhabitants of this antipodean Paris to exist, will not of itself occupy a very great portion of that 100 square miles that our State is to cede to the Commonwealth. Let us take an instance. The area of Washington is said to be 10 square miles, and the population in 1890 was roughly 203,000, say 20,000 to the square mile. If, then, we take two square miles and lay that out as our Federal city we must be considered to have allowed ample room for the assumed 20,000 inhabitants. Of course it may be said that I am underestimating the possible population, but Washington, brought in existence under similar circumstances, had only a population of little over 8,000 seventeen years after the foundation of its capital was laid. I have merely taken this number as a unit, but you may make it anything you please, and by allowing 20,000 to the square mile you will arrive at the size of the proposed Federal capital on the Washington basis. For the first few years, at any rate, I think that to put the total population at 20,000 is a sufficiently liberal estimate. This being granted then, our city would not cover more than an area of 2 square miles, and when the site is selected I would invite competitive drawings from all the world for the laying out of this portion, and this portion only. Let us make a study of our actual requirements, and if we can meet them in a satisfactory way we can afford to be careless of the future.

My city, in other words, would be as complete and self-contained as the town of Mediaeval days encircled by its wall. Some system, of course, would have to be adopted by which its future growth would be regulated; and for my own part I should favour the radial system, intersected by streets in a bold series of concentric circles, with a system of rectangular streets between. By this means it would be possible to extend zone beyond zone as the increasing population demanded it. It would not be allowed to stretch away in any direction, but that would be the only restriction. We should leave nothing else predestined or prearranged. Each zone, or part of a zone, could be laid out as it was required; all previous mistakes rectified and all increased necessities provided for. Washington earned its sobriquet of the "City of magnificent distances" from the fact that its huge framework of streets in years stretched out miles beyond the city itself, and precluded any alteration of the original design. It also, by extending in

the wrong direction, made the Capitol apparently turn its back upon the greater part of the town. By the system here proposed the Houses of Parliament and the Government buildings should be the centre round which would cluster all the other buildings, and no matter how vast in after years the city might become that centre would remain fixed and unaltered. As to the laying out of the town itself, what with Herr Stubben's paper on "The Construction of Towns" and Mr. Knibbs's valuable contribution, "The Theory of City Design," there seems to be very little left to say. So little at present would this capital of ours be a city of utility that I think it ought to be designed by artists working in conjunction with architects and surveyors—if only we could find some modern Poussin or later Turner. There are one or two things, however, I might suggest. The main thoroughfares should be triple avenues about 150 feet in width, and the other streets need not be more than a chain in width. There should be trees everywhere—deciduous trees for the most part, and not the ubiquitous pepper tree and the eternal fig. Flowering trees should also be placed at intervals, such as the Japanese plum and cherry, in order that we might have a blaze of blossom interspersed among the tender green. There should be lawns or rather ribands of smooth-shaven turf, separating the houses in the residential part from the footpaths; circuses should be formed at the intersections of the main streets, and the centre in each case marked by a great fountain or a monument. As for the houses themselves, each block should be more or less uniform as regards height and material, but a good deal of latitude might be allowed with regard to treatment, imposing only sufficient restraint to prevent incongruity. There should be no overhead electric wires; and it is to be devoutly hoped before the city is an accomplished fact that engineering science will have advanced sufficiently to enable the Federal water and sewerage board to devise some system of sewerage, which will not necessitate a forest of hideous ventilating pipes to insure its efficiency.

## TESSERÆ.

### The Use of Choirs in Churches.

IT may be doubted whether the exclusion of the laity from the outer chancel or choir was ever in ordinary cases very strict in practice, however it might have been in theory. It is, perhaps, no great proof of this that no such strictness is usual in continental churches at the present day, and that their choirs are often absolutely crowded with people of all orders. But it would appear hardly inconsistent with reason that there should be one part (the sanctuary) from which they were absolutely excluded, and one from which they were only debarred for the sake of convenience and good order. Sparrow says:—"In it (*i.e.* the chancel) were, at least in some principal churches, these divisions—chorus cantorum, the quire, where was a high seat for the bishop, and other stalls or seats for the rest of the quire, and the chancel properly, that which of old was called *agion bema*—'the sanctuary,' which was separated from the rest of the church with rails, and whither, indeed, none but sacred persons entered, whereas the laity entered into the other." Hooker, in speaking of the division in churches "between the clergy and the rest," adds in a parenthesis, "which yet we do not with any great strictness or curiosity observe neither."

### Discovery of Pompeii.

The light volcanic mould abundantly spread over the buried Pompeii in time became capable of cultivation, and the unconscious husbandman reaped from the fertile soil which covered the roofs of the buildings rich crops of wine and grain. Not a trace of even a ruin was to be seen for many centuries except a fragment of an old wall, which had constantly been supposed to have been reared on the surface on which it was thought to stand, but which, in fact, proved afterwards the most elevated part of the great theatre of Pompeii. Its superior height over all the other buildings had caused it to project above the volcanic stratum. In this state of things and subsequent to the discovery of Herculaneum, the hoe of a labourer was arrested by a hard substance. On removing the surrounding earth he perceived that he had nearly decapitated a small statue of, as he thought, massive gold. His eager efforts to pull up the fancied treasure were fruitless; the idol was firmly rivetted into a stone pedestal and the latter still more strongly cemented into some hard substance underneath. The peasant, however, had his wits about him. After possessing himself of a small fragment of the doubtful metal he restored matters in *statu quo* and left the field in the evening. The verdict of a silversmith was obtained in course, and being satisfied of the impossibility of turning the brass, even in his possession, to any great account, the peasant at once became loyal and honest, and imparted his secret to the proper officer of government, who immediately ordered the ground to be excavated on the spot pointed out. The image was soon found again, and,

moreover, it was ascertained that it constituted the ornament of the roof of a small temple, which, being likewise laid open, was the signal for all future Pompeian discoveries. The statue proved to be a Minerva, perfect in all parts except the head, which was nearly cleft in two by the sacrilegious hoe.

#### Sir Jeffry Wyattville.

In his youth Jeffry Wyatt, the son of a surveyor at Burton-on-Trent, was so far from displaying any predilection for studies connected with his future profession, that he was bent upon going to sea, and made two attempts to do so. At the age of seventeen he was to have gone out with Admiral Kempenfeldt in the *Royal George*, but being prevented from joining the vessel in time, he escaped the fate which awaited it at Spithead. Thus thwarted, he betook himself to the Metropolis in the hope of finding some opportunity of entering into the naval service, but as the American war had terminated no such opportunity offered. These disappointments, however, were all so many turns of good fortune. His uncle Samuel, an architect and builder of some note and considerable practice (who erected the Trinity House, London; Heaton House, Lancashire; Tatton Hall, &c.), although almost obscure in the profession, in comparison with James, took him into his office for seven years. At the end of that period, in the course of which he had become fully acquainted with the routine and business of his profession, he served a sort of second apprenticeship with his other uncle James Wyatt, R.A., and it was no doubt from him that he imbibed a preference for the Gothic and Old English styles. While with James he was brought into contact with several persons of high rank and influence, and among others his future royal patron, then Prince of Wales. No great encouragement, however, at least no opportunities, seem to have been held out to him at that time from that quarter, for in 1799 he accepted the proposal made him by John Armstrong, a builder, who had extensive Government contracts, to join with him. The business he now engaged in was highly respectable, nor the less so because eminently lucrative. Still it proved for about twenty years a bar to his admission into the Royal Academy as a member. It did not, however, prevent his being employed very extensively as an architect by many noblemen and gentlemen in various parts of the country, either in improving and making additions to their mansions or erecting new ones. Nearly all his works are of this class, however varied in themselves, with the exception of the new front of Sidney-Sussex College, Cambridge. He was not, therefore, so much known by repute to the public generally as he might have been had he been employed on buildings more open to notice. It seems to have been unexpected by himself when he was summoned to Windsor by George IV. in 1824; and perhaps it occasioned some surprise in others when it was first announced that Mr. Jeffry Wyatt, who changed his name to Wyattville, was to be the architect employed in remodelling the castle—such an opportunity for the display of talent as had not till then been offered to anyone in the profession for full a century. That work nearly occupied him exclusively for the remainder of his life, during which he resided chiefly at Windsor, within the precincts of the castle, in what is called the Wykeham Tower, at the western extremity of the north terrace, and where, after suffering for five years under an asthmatic complaint, he died February 18, 1840, in his seventy-fourth year, and was buried in St. George's Chapel.

#### Public Opinion and the Artist.

A man of fine talent is always to a certain extent the creation of the age in which he appears. The point from which he sets out is that condition of knowledge and illumination which prevails at the moment his career begins. The same opinions, the same feelings which influence the public opinion, have also their influence upon him. They have also enlightened his nascent intellect, have fanned his earliest fires. And in this point of view the condition of the taste of an age and a country may be reckoned among the constituent elements of genius. But while we admit that his achievements are the result of this double cause—on the one side the powerful impulse of his internal inspiration, on the other that which arises from the ideas, the prejudices and the opinions which prevail over all that surrounds him—it remains still to examine in what proportion these two principles are united, and how it happens that sometimes one and sometimes another exercises so powerful an influence. In this respect circumstances do everything. With a people who are more under the influence of reason than of sensibility, whose opinions are firmly formed and whose prejudices are tenacious, who mingle with the enjoyments of intellect more of pedantry than of enthusiasm, genius is compelled to restrain its flight within the narrow boundaries which are prescribed. It must tread that path which is marked out for it. It submits to laws instead of imposing them. It does not direct opinion, but is directed by it. Its features are with difficulty seen through the mask which encumbers them. There taste is the tyrant and genius the slave. On the contrary, in a nation where the taste

is not entirely formed, where the idol of opinion requires less sacrifices, genius launches freely and fearlessly on its career, and pursues it without trammels. It bends under no pre-existent rules. It creates the rules by its own example. It obeys no laws, but it becomes a legislator, and it stamps the glorious impress of its own character upon its works, upon the age in which it flourishes. In a word, genius is then a sovereign to whom taste is the subject.

#### Arabic Pendentives.

The stone and plasterwork of Cairo is chiefly surface decoration, of an even or flat tone, which has little or no constructive meaning, and seems to be more or less derived from the patterns which were used for the decoration of textile fabrics. The stalactite or pendentive bracketing, however, is strictly constructive, and forms a strongly marked characteristic of Saracenic art. Its first and principal use is for masking the transition from the square, as in a mausoleum, to the circle of the dome. In their domes the Arabs adopted and improved on the constructional expedient for vaulting over the space beneath, and passing from a square apartment to the circle of the dome, used by both Byzantines and Persians. The church of Sta Sophia, at Constantinople, presents fine examples of its Byzantine form; but in later edifices of that style constructional difficulties seem to have confined the architects to small domes. The buildings of the Sassanian dynasty also contain pendentives. The Arabs, with their peculiar faculty for cutting away all superfluous material, naturally arched the overlapping stones that filled up the angles of the building, and by using pointed arches overcame the difficulty of the Byzantine architects. The pendentive was speedily adopted by the Arabs in Egypt in a great variety of shapes, and for almost every conceivable architectural and ornamental purpose, to effect the transition from the recessed windows to the outer plane of a building, and to vault in a similar manner the great porches of mosques, which form so grand a feature characteristic of the style. All the more simple woodwork of dwelling-houses was fashioned in a variety of curious patterns of the same character; the pendentive, in fact, strongly marks the Arab fashion of cutting off angles and useless material, always in a pleasing and constructively advantageous manner.

[The Editor does not hold himself responsible for opinions expressed by the writers.]

#### Architecture in 1901.

SIR,—Permit me to point out that the writer of the article entitled "Architecture in 1901," which appears in your issue of 3rd inst. (page 4), has adversely commented upon the action of the Birmingham Architectural Association in connection with the Birmingham University without a full knowledge of the facts.

In the first place, the B.A.A. fully appreciate the architectural abilities of Messrs. Webb & Bell; as evidence thereof, when the Corporation determined to erect police offices adjoining the Victoria Law Courts, and proposed to have an architectural competition, I wrote to the Mayor protesting against such a course, and called a meeting of the B.A.A., at which it was unanimously resolved to petition the Council to employ Messrs. Webb & Bell to make the additions to their building. Fortunately our views were favourably considered, and I hold a very cordial letter of appreciation from Messrs. Webb & Bell of the action taken by the B.A.A.

With regard to the University, the difficulty was to obtain any reliable information on the subject. At first we were informed that Messrs. Webb & Bell had only been provisionally consulted. Then it was urged there should be a competition—not confined to Birmingham architects, as stated in your article, but either entirely open or among a selected few.

Some time afterwards the Vice-Chancellor made the astounding statement that, because Lord Calthorpe had imposed restrictions in connection with the gift of a site, the principle of competition could not be advantageously adopted; but Lord Calthorpe's agent wrote to the papers and absolutely denied that any restrictions imposed necessarily affected the question.

Up to that time no public announcement of the appointment of Messrs. Webb & Bell as architects had been made, and I have it on the authority of two members of the Council that they knew of no such appointment. I am sure if the writer of the article, whoever he may be, knew the members of the B.A.A. as well as I do and was accurately acquainted with the facts, he would not have even suggested selfish motives on the part of any one of them.

I should scarcely have ventured personally to show up the fallacious insinuations of the article referred to had no mention been made of the Royal Victoria Hospital, Belfast; but in addition to the architects of Birmingham being gratified that one of their number was selected for that work, I have the satisfaction of knowing that the architects of Belfast realise that the committee of the hospital went about the selection of an architect in an open and business-like way, and that after inspecting all the large recently erected hospitals, they appointed a perfect stranger to every one of them, simply from the evidence of the actual work of—Yours truly,

WILLIAM HENMAN, F.R.I.B.A.

P.S.—I trust that in fairness to the architects of Birmingham you will permit the above to appear in your next issue.  
19 Temple Street, Birmingham : January 6, 1902.

#### Fire Insurance.

SIR,—May I bring to the notice of your readers the fact that in most fire insurance policies there is what is known as an "average clause," the wording of which is very complicated, but the exact legal meaning is that if a man insures half the value of his stock or premises and a fire occurs, the company will only pay half the value of the ascertained loss; thus, if a man had stock to the value of 4,000*l.* and he had only insured for 2,000*l.*, and he had 1,000*l.* worth of damage through fire, the insurance companies would only pay him 500*l.*

Believing that this is a most iniquitous clause and not generally understood, I take the liberty of sending you the above letter.

It is also a fact that in London the fire insurance premiums have been increased from 400 to 500 per cent. more than they were six or seven years ago.

Seeing that the companies are, many of them, if not all of them, still paying 20 per cent. and more on their paid-up capital, it seems that the only way to bring them to reason, both in their charges and conditions, is for the general body of ratepayers to insist on municipal insurance. This plan has been adopted in several places with very great success and immense saving to the pockets of insurers.

I enclose my card as a proof of good faith, but not for publication.—Believe me, yours truly,

A SUFFERER FROM FIRE INSURANCE RAPACITY.

January 6, 1902.

#### Bailey v. Longton at Leeds Assizes.

SIR,—In your last issue you remark, "It would be interesting to know the private opinion of Mr. Justice Ridley on the evidence that was given."

The learned judge commented on "the evidence of defendant's witnesses," whether in a flattering manner or otherwise you may gather from the judgment for the full amount claimed, nearly double that which the said witnesses swore was "reasonable" payment, and, of course, the judgment carried costs—about 300*l.* The witnesses referred to were F. W. Bedford, A.R.I.B.A., Leeds; J. W. Connon, F.R.I.B.A., Leeds, and C. France, F.R.I.B.A., Bradford. You also refer to an alleged estimate of cost. It may interest any of your readers who may be troubled with ill-advised clients to learn that the first appearance of this bogus estimate was when defendant entered his defence to the action, and on which he denied liability. At the very opening of the case in Court defendant's counsel admitted liability, dropping the estimate defence, and it was subsequent to this that the three members of the R.I.B.A. gave their evidence.—Yours, &c.,

Bradford : January 7, 1902. W. BAILEY.

#### GENERAL.

**The Italian Government** has purchased the Ludovisi Boncompagni Museum, and it is now open to the public in the Baths of Diocletian. It is intended to unite all the Roman museums in the Villa Borghese, forming a national museum of Italy.

**The King** has given permission to Mr. John Morris-Moore to accept and wear the insignia of a Commandership of the Order of the Crown of Italy, conferred upon him by His Majesty the King of Italy in recognition of services rendered by him in Italy to Italian literature and art.

**M. Leclerc**, the architect of the château of Rambouillet, has commenced the restoration of several of the fountains of St. Cloud. The plan of the palace has also been carefully traced out with flower borders and turf.

**Dr. Baurath von Schich**, the Palestine explorer and one of the best authorities on the topography of ancient Jerusalem, has died in Jerusalem at the advanced age of eighty years. He settled in Jerusalem fifty-five years ago, where he worked as an architect. His miniature model of Jerusalem, with the

Ark of the Covenant and the Temple, is a permanent memorial to his patient and untiring labours.

**The Hungarian Sculptors** who are participating in the prize competition for a monument to the late Empress Elizabeth have mooted the idea of inviting the German Emperor to act as judge. The sculptors think that the Kaiser may permit himself to be represented by a prominent artist.

**Westminster Abbey** will be closed from March 31 for the preparations necessary for the Coronation. In accordance with precedents, the Dean will first instruct an architect to report upon the best method of carrying out the alterations without interfering with the permanent character of the building, and then the work will be placed in the hands of the Office of Works.

**The Fine Art Society** will open on Monday an exhibition of the water-colour drawings, &c., left by the late Miss Kate Greenaway.

**Mr. St. John Hope**, assistant secretary of the Society of Antiquaries, has discovered the foundations of the great hall of the infirmary of the Lewes Priory. The infirmary lies to the east of the monastery and south of the Priory chapel, which was uncovered last year. The excavations are being carried out under the personal direction of Mr. H. Michell Whitley, of the Sussex Archaeological Society.

**Reports** have appeared during the last few days, says a correspondent of the *Times*, to the effect that one of the largest private collections of works of art in Italy is to be removed to America. What the collection is and how the Italian law prohibiting the export of the masterpieces is to be evaded is not stated. A representative of the Syracuse Museum of Fine Arts said that he expected that the negotiations would be completed in a few days, adding that the collection included works by Raphael, Michel Angelo and Titian.

**Lord Strathcona**, the Lord Rector of the University, has sent a cheque for 25,000*l.* towards the Aberdeen University building scheme. This sum was promised in December 1900, under certain conditions which have been fulfilled.

**M. Georges Bateau** has completed the model of a large relief illustrative of Victor Hugo's "Légende des Siècles" and containing a multitude of figures. It will be placed, when executed in marble, either in the Panthéon or the Musée Victor Hugo.

**Dr. A. S. Murray** will deliver on Thursday next before the Royal Institution the first of a course of three lectures on "Recent Excavations at Delphi and in the Greek Islands."

**The General Purposes Committee** of the King's Norton Urban District Council recommend the purchase of a piece of land situate at King's Norton and containing 7,567 square yards, for the sum of 1,135*l.* 1*s.*, for the purpose of the erection thereon of public offices.

**Mr. F. B. Behr**, the well-known advocate of the mono-rail system of electric traction, last week gave a lecture at the invitation of the Belgian Society of Engineers in the Brussels Bourse on the subject of the Manchester and Liverpool Railway, in which he dealt generally with the question of high-speed railways.

**The Queen's Memorial Hall**, erected in connection with St. Augustine's Church, Brighton, was opened on Monday. The tender of the contractor, Mr. H. J. Penfold, for the building was 2,550*l.* Seating accommodation is provided for over 500. The architect was Mr. G. E. S. Streatfield.

**The German Emperor**, after making several alterations in the plans of a police-station to be erected at Wiesbaden, has returned them to the local authorities.

**The Commissioners of Works** in Ireland accepted by deed during the past year the guardianship as ancient monuments of Cashelmore, county Sligo; Round Tower, Kells, county Meath; Tullaherin Round Tower, county Kilkenny; and Lusk Round Tower, county Dublin.

**The late M. Thomy Thierry**, a native of Mauritius, long resident in Paris, who has just died, bequeathed to the Louvre important works by Corot, Delacroix, Troyon, Millet, Rousseau, Daubigny, Isabey, Decamps, Jules Dupré, Diaz, and a number of bronzes by Barye.

**The Dean and Chapter** of Peterborough hope to be able to grant permission for the cathedral bells to be rung in honour of the King's coronation. The bells have been silent for fifty years, fears being felt that the vibration would endanger the safety of the west front. The structure has now been made thoroughly secure, and the bells were rehung some years ago. An expert is to be called in before any risk is run.

**The Institution of Civil Engineers** will hold an ordinary meeting on Tuesday next, the 14th inst., at 8 P.M., when a paper on "American Workshop Methods in Steel Construction," by Henry Bridges Molesworth, M.Inst.C.E., will be submitted for discussion.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## ANSWERS TO CORRESPONDENTS.

**ARCHITECT'S LIABILITIES (W. W. L.).**—If the building owner can establish negligence on your part in supervising the erection of the building then he can undoubtedly recover from you the loss he has sustained by your not seeing that the house was built according to your plans and specifications. It would be worth your while, however, to point out to the building owner that you have done all that could reasonably be required of you in visiting the place fortnightly, and that his right of action is against the builder for defective work.

**DISTRESS (F. G.).**—While the rent remains in arrear the landlord may distrain for it, unless after the rent became due he accepted a *bonâ-fide* security.

**DAMAGES (Pauper).**—To sue *in formâ pauperis* it is necessary first of all to obtain the certificate of a barrister that you have a good cause of action. You cannot so sue if you have goods worth 25*l.* or upwards.

## COMPETITIONS OPEN.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

**BATTERSEA.**—Jan. 31.—Premiums of 50*l.*, 25*l.* and 10*l.* respectively are offered for the three best sets of designs, &c., of dwellings, as follows:—(a) A house of two storeys; (b) a house consisting of two self-contained tenements; and (c) a house consisting of three self-contained tenements. Mr. W. Marcus Wilkins, town clerk, Municipal Buildings, Lavender Hill, S.W.

**GLASGOW.**—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

**HULL.**—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

**IRELAND.**—Jan. 20.—Plans, &c., are invited for drainage of Howth and Sutton, Dublin (and an alternative system for the latter). A premium of 50*l.* is offered. Mr. John O'Neill, clerk, board-room, North Brunswick Street, Dublin.

**ISLE OF WIGHT.**—Jan. 31.—Designs are invited for a suitable monument as a memorial to Her late Majesty, to be erected in St. James's Square, Newport, Isle of Wight. A premium of 25*l.* is offered for the accepted design. The Secretary, Isle of Wight Queen Victoria Memorial Committee, 20 Holyrood Street, Newport, Isle of Wight.

**LANGHO.**—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200*l.*, 150*l.* and 100*l.* respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**LIVERPOOL.**—Jan. 31.—Applications are invited from architects willing to submit designs in a limited competition for rebuilding the Liverpool Infirmary for Children. Colonel C. Forbes Bell, Eagle Chambers, 17 Fenwick Street, Liverpool.

**SCOTLAND.**—Jan. 15.—The Kirkcaldy Burgh School Board invite competitive plans for a technical and science and art school to accommodate from 400 to 500 pupils, and an elementary school to accommodate about 400 pupils. Mr. Alexander Beveridge, clerk to the Board.

**WALES.**—Feb. 4.—Competitive designs are invited for municipal offices proposed to be erected by adapting, adding to and rearranging the town hall buildings at Mountain Ash. A premium of 75*l.* will be paid to the author of the design placed first in order of merit. Mr. H. P. Linton, clerk, Town Hall, Mountain Ash.

**WREXHAM.**—Feb. 1.—For erection of dwelling accommodation for the horsekeeper, &c. Mr. Thomas Bury, town clerk, Guildhall.

**WREXHAM.**—Feb. 18.—For reconstruction of the main lantern lights along the roof of the butchers' market, &c, and reconstruction of market sanitary arrangements and conveniences. Mr. Thomas Bury, town clerk, Guildhall.

THE Bishop of Reading opened the new National schools at Winslow, Bucks, on Tuesday afternoon, in the presence of a large company. The cost of the schools was 2,700*l.*, of which 400*l.* remains to be subscribed. In the course of his address his lordship dwelt on the necessity of seeing that religious teaching was continued in public elementary schools.

THE Tower House in High Street, Leicester, will shortly be demolished in order to carry out an extensive scheme of street improvement. The building dates back to the early part of the sixteenth century. In 1569 it became the residence of the Earl of Huntingdon, and in that year the Earl had under his care at the Tower House Mary Queen of Scots. King James I. was a guest there in 1612 for seven days, and Charles I., Prince Charles—afterwards Charles II.—and Prince Rupert were visitors in later years.

**A SPLENDID RECORD.**  
 Two Great Newspapers.

Recently the owner of a foundry saved by the May-Oatway Fire Alarm wrote:—"It is the best," and now the *New Zealand Star*, referring to a big gas explosion in its own premises, says:—"A satisfactory feature is the test it gave to the efficiency of the May-Oatway Fire Alarm apparatus. Though only a little heat was generated the apparatus promptly signalled the alarm, and the fire brigade arrived." The *Otago Daily Times*, whose premises are also protected by this system, in referring to the *Star* explosion, says:—"It would thus appear that the May-Oatway Alarm is as efficacious in the case of an explosion as it has already proved itself to be on an outbreak of fire." This confirmation of its high reputation gave great satisfaction to the Brigade and Insurance authorities, the two great organisations of which have unanimously recommended this system.

NEW CATALOGUE.

THE diary issued by Messrs. Dorman, Long & Co., Ltd., shows consideration for the limited capacity of modern pockets. Under no circumstances could it be called an encumbrance. In addition to the ruled pages for entries, tables are given relating to iron and steel in many forms, which contain the class of information which it is important but difficult to remember.

A NEW elementary school, erected by the School Board at Ardeer on the south side of the Glasgow and South-Western Railway, and designed to meet the educational requirements of a growing district, was formally opened on Monday. The school is built on the most approved style, and consists of six large classrooms, with the usual cloakrooms, lavatories, &c., and will accommodate 380 pupils.

THE opening took place on Tuesday of a new hospital which has been erected at Sutton, Surrey. The new building is a modest structure of pleasing appearance, which now succeeds the two cottages in Bushey Road that for the last three years have been lent by the Urban District Council at a peppercorn rent for hospital purposes.

SUB-AGENTS OR TRAVELLERS REQUIRED THROUGHOUT THE UNITED KINGDOM.

**ELECTRIC NOTES.**

THE estimated cost of Manchester's proposed tube railway is 1,112,763/.

AT Monday's meeting of the electricity committee of the Manchester Corporation it was reported that during the past fortnight the output of electrical energy had been 716,165 units, as compared with 491,060 units in the corresponding period of last year. This result, it was stated, had been achieved although the number of men now employed was 457, against 571 twelve months ago, and the amount of wages paid 1,300/ against 1,370/. The committee, over whom Dr. Bishop presided, considered the report highly satisfactory.

THE elaborate electrical effects of the great fan scene in the Drury Lane pantomime are installed on the E.L.B. system. Several thousand lamps are used nightly. The same system of the Electric Lighting Boards Company has also been applied for Mr. Moss's large "Cinderella" pantomime at Liverpool. The application of the system to theatrical work has mainly found favour on account of the rapidity of installation, a point of the utmost importance in the production of plays, and in which the company is constantly beating time records.

THE North-Eastern Railway Company are at the present time engaged upon a comprehensive scheme of alterations and extensions to the existing dock accommodation at Middlesbrough, which upon completion will afford ample facilities for the docking at the Tees port of the largest vessels afloat. Electricity will be largely utilised for both motive and illuminating power, and the generating-house recently erected close to the docks is one of the largest in the North of England. The steam cranes formerly used on the quays are now being replaced by powerful electric cranes, of which no less than seventeen are to be installed. The new cranes are of great height, the distance from the quay to the centre of the pulley at the end of the jib being 60 feet, while the radius is 44 feet 9 inches. Each crane is carried on a pedestal which will run on the railway lines alongside the quay. It is operated by an electric motor placed on the lower part of the pedestal. Separate motors are provided for hoisting and revolving, the current being supplied by underground cables through coupling-boxes placed at convenient distances along the quay. The load is lifted at 150 feet per minute, half-loads being lifted at

225 feet a minute. The revolving speed at the hook is 400 feet per minute, and the travelling speed 40 feet. These speeds, however, can be reduced as required, whilst, in addition, an automatic break is provided in case of failure of the current.

**VARIETIES.**

MR. STUART GRACE, town clerk of St. Andrews, N.B., died at his residence there on the 2nd inst., after a prolonged illness.

THE Independent chapel at Mortlake, which is one of the oldest buildings in connection with London Congregationalism, having been erected in 1716, has been closed, and the congregation will shortly enter into possession of a new church, which is in course of erection.

FORTY cottages have been erected by the Manchester Corporation at Miles Platting for the accommodation of families who have been displaced by city improvements, and the estates sub-committee, after a full investigation, have recommended that a clerk of works and a district building inspector should be dismissed for having passed very bad work.

ON January 1 Mr. Sacheverell, who entered the service of the firm seventy-four years ago, called to wish the directors of G. B. Kent & Sons, Ltd., "a happy new year" on their entering the 125th year of the firm's existence. He was accompanied by Mr. W. Benwell (late foreman of the painting brush department), who came to work for Kents on March 25, 1846, and who is now retired on a pension, so that the combined years of service of the two old employes amounted to 130 years, which must be a record hard to beat.

THE new chancel added to St. John the Baptist Church, Sevenoaks, was consecrated on Saturday last by the Archbishop of Canterbury. The new building was designed by Mr. Hoole Thomas, of London, and the work has been successfully carried out by Mr. Wiltshire, builder, of Sevenoaks. It is red brick, with a roof of corrugated iron, and is built in the Gothic style. The extension provides additional seats equal to those of the old existing part. Under the large east window the altar-table is approached by steps raising it well above the ground level. On the left has been provided an organ-chamber and additional vestry accommodation.

ST. MARY'S CHURCH, ECCLESTON: NAVE, LOOKING EAST.

SAVINGS BANK, GLASGOW. THE BOARD-ROOM.

VILLA TIJUGA, VILLEFRANCHE.

ST. PHILIP'S CHAMBERS, BIRMINGHAM.

THE new United Free church at Finstown, Orkney, which is seated for 400 persons, has been opened for public worship.

A NEW boys' school which has been erected at Ellesmere Port was formally opened on Monday afternoon by Dr. Jayne, Bishop of Chester. The school, which is a handsome building, stands in Church Street, near Christ Church, and opposite to the mixed school. It is 96 feet long and 21 feet 6 inches wide, the room being practically divided into two by a glass partition. The building is constructed in Ruabon red brick, while internally the appearance is artistic, bright and cheerful, the comfort of the room having been assured by the institution of a hot-water system, by which the temperature can be regulated. The total cost of the building is 1,700*l*. There is accommodation for 200 boys. Messrs. E. Griffiths & Co., Ellesmere Port, carried out the building contract to the design of Mr. J. R. Gebb, architect, Birmingham.

MUCH has of late been written as to British manufacturing firms not being able to compete with America, with the result that large orders, especially for engineering work, have left the country because America was able to give quicker delivery and cheaper price. We are glad, however, to know that many British firms are successfully competing with America and Germany, and are making special arrangements in order to give greater facility for reducing the cost of production and expediting delivery. When the Central London Railway was constructed, all the rolling-stock, rails, lifts, in fact nearly all the engineering plant, was imported from America, and when the company decided on some additional lifts they asked tenders not only from America but also from some British firms, and it is pleasant to note that a British firm in this instance has been successful. Messrs. R. Waygood & Co., Ltd., of Falmouth Road, London, S.E., have been entrusted with this contract, being able to comply with the special requirements of the railway company. We also note with satisfaction that the lifts for

the City and South London and the Great Northern and City Railways have been secured by a British firm in face of keen American competition.

THE new pavilion on Southport Pier was opened on New Year's Day. This forms part of a large scheme of improvements on the pier, which also includes setting back the entrance about 60 feet, new entrance buildings, toll offices, &c., and widening the pier. The new pavilion, which is calculated to seat about 1,500, has been built to take the place of that which was destroyed by fire. The shell is formed of steel and cast-iron, filled in with panelled and moulded framing in the lower parts and glass in the upper, with ornamental heads. The roofs are boarded and covered with zinc. All floors are finished with pitch-pine boards in narrow widths. The general plan consists of a large hall, 90 feet by 53 feet, with recessed alcoves on each side, and galleries on three sides. The principal entrance is placed at the promenade end of the building, where are also the office and main staircases to gallery. On each side of this entrance are provided ladies' and gentlemen's retiring-rooms. Access is obtained to main hall on each side of the ticket-office by means of swing doors so arranged as to check draughts as far as possible. Entrances are also provided in each side of the building. The one near the Marine Bridge will ultimately be provided with an ornamental covered way, so that it will be possible to drive up to and enter the building without exposure to the weather. The gallery front, proscenium and a portion of the ceiling have been specially designed and modelled for this work, and are finished in enriched fibrous plaster. The building is lighted throughout with electric light, and is heated by means of chancel gas-stoves, six of which are let into the floor. A small system of gas lighting is provided in case of emergency. One of the principal features of the building are the outside balconies, which in summer will no doubt prove a great attraction. An octagonal turret is placed at each corner of the building, finished with a cupola and ornamental iron finial. The pavilion is divided from the pier by means of ornamental iron railing with electric-light standards in same. The whole of the work has been carried out from the designs and under the supervision of Mr. R. Knill-Freeman, F.R.I.B.A., of Bolton and Manchester. Engineer for superstructure, Mr. Walter Tester, C.E., Manchester; engineers for substructure, Messrs. C. S. Allott & Son, Manchester; local superintendent of the work, Mr. Orlando E. T. Prescott, Southport; contractors, Messrs. W. A. Peters, Rochdale.

**BUILDING AND BUILDERS.**

THE West Ham School Board are building two large blocks of premises in Carter Road, Plaistow. Mr. William Jacques, of 2 Fen Court, E.C., is the architect.

THE new schools erected by the Smethwick School Board in Durban Road, Cape Hill, have been opened by Alderman W. H. Goodyear.

MESSRS. FOULSHAM & RICHES, architects, of 3 Crooked Lane, King William Street, London, are carrying out extensive alterations at the Shaftesbury Arms, Hoxton.

THE architects for the new offices and coal stores at the Hackney Electricity Works are Messrs. Gorton & Gunton, of Finsbury House, Blomfield Street, E.C.

MESSRS. WRIGHT & DAVIE, builders, of Edinburgh, have secured the contract for the enlargement, at a cost of 4,000*l.*, of the post office at Dunfermline.

THE Enfield and District Land Company are building a block of cottages at Ponder's End, Middlesex, of which Messrs. Michael Faraday & Rogers, of 77 Chancery Lane, E.C., are the architects.

THE foundation-stone was laid on the 27th ult. of the new Congregational church, Primrose Hill, Northampton, which is being erected at a total cost of 3,000*l.* Mr. Alexander Anderson, of Northampton, is the architect, and Mr. G. W. Souster, of Northampton, the builder.

THE premiated designs for the new baths and library to be erected in York Road, Leeds, have been on view this week in the Leeds City Art Gallery. Premiums were gained as follows:—(1) Mr. H. A. Chapman, (2) Mr. W. Bakewell, and (3) Mr. Percy Robinson. All are Leeds architects.

FOR some time past the Jewish community at Hull have been very much exercised over the question of a new synagogue, the old one having become obsolete. A site has been purchased in Osborne Street, very near to the Jewish quarter, for the sum of 1,900*l.*, on which a school and a synagogue will be erected, and the work will be taken in hand as speedily as possible.

SEVERAL Maidstone firms belonging to the Master Builders' Society have locked out the carpenters, joiners and bricklayers in their employment because they arrived at work at 8.30 instead of eight o'clock on Monday and Tuesday mornings. It is believed that the remaining firms will adopt the same course. The men's society does not seem inclined to give way.

IT will be remembered that some time ago the master plasterers of Perth gave notice to the men of a reduction of a halfpenny on wages. The men, however, came out on strike. At a meeting of the masters and men on the 6th inst. the masters made a compromise that wages would be reduced on and after March 10. The men have accepted these terms.

THE Prince of Wales has consented to visit Bristol on March 5 to cut the first sod of the new dock at Avonmouth, which is to be constructed by the city at a cost of 2,000,000*l.* The Lord Mayor of Bristol, Alderman Howell Davies, and chairman of the dock committee, had an interview with Sir Arthur Bigge at York House last week, when preliminaries were arranged.

THE Liverpool City Council have under consideration an important proposal in connection with an increased water supply. The scheme consists in laying a second line of pipes from Lake Vyrnwy, the city's present source of supply in Wales. The estimated cost is 785,000*l.* The first section of the work to be undertaken is that between Norton and Prescot, and this in itself will involve an outlay of 116,000*l.*

THE designs of Messrs. Cossins, Peacock & Bewlay have been accepted for the erection of a church at the Cotteridge, King's Norton, Worcester. They are now ready for submission to the Christ Church trustees, who made a grant towards the building fund of 2,500*l.*, and on their approval the building will be carried on expeditiously. This church is estimated to cost 9,000*l.*

THE new infants' school at Boldmere, Sutton Coldfield, which has been in course of erection for some months past, was formally opened on the 6th inst. It has been built by Mr. John W. Smith, of Small Heath, at a cost of 1,200*l.*, from plans furnished by Mr. E. F. Titley, architect, Birmingham, and consists of a large schoolroom, classroom, cloak-room and store-room, with outbuildings and playshed to accommodate 116 children.

THE hospitals committee of the Metropolitan Asylums Board have decided to proceed immediately with the building of a hospital at Longridge, in the neighbourhood of that already existing, at a cost of considerably over 100,000*l.* It is expected that the hospital will be ready to receive patients in two months' time. This addition, to decide on which a meeting was held on the 6th inst., is not to be confounded with the new ambulance station at West Wharf, Fulham, to be

**147 STRAND, LONDON, W.C. (FIRST FLOOR)**

built at a cost of 26,500*l.*, which was decided upon on Saturday at the weekly meeting of the Asylums Board.

At a recent meeting the Barnsley Guardians discussed which of two plans should be accepted for the conversion of a house in Pitt Street into offices. The matter was adjourned a fortnight ago, when the committee recommended, by four votes to two, plan No. 3. One of the majority on the committee, a lady, now said that she had changed her mind, and as the committee appeared to be evenly divided a suggestion was made that the matter should be referred back. The chairman, however, said he had nothing to do with the shuffling of the cards, and declined to accede to this, with the result that the committee's plan—costing 1,350*l.*—was accepted. The rival plan provided for alterations to cost 1,000*l.*

THE brick trade in various parts of the Black Country is just now in a very depressed condition. The high prices of bricks and materials which have prevailed for some time past have checked building operations to a serious extent, and the recent severe weather also made the depression more acute. The result of the slackness in the demand during the last two or three months is that stocks have unduly accumulated, and the advisability of closing some of the large works, at least temporarily, is being considered. The announcement of a fall in the price of coal comes at a very opportune time, so far as this important industry is concerned, and with better weather and the coming of spring, the trade generally, it is hoped, will shortly show signs of improvement.

THE work of altering and making additions to the Wolverhampton town hall, which is expected will cost nearly 15,000*l.*, has been commenced. The first portion of the alterations which has been started upon relates to the fire brigade station in Red Lion Street. The old buildings have been taken down and the new ones will shortly be built. They will consist of engineer's shop and engine-house, which will occupy a space of 59 feet by 31½ feet, and the building will run across the old double gateway, a new one being placed in the wall near to the present detective office. Hitherto the horses for the fire-engines have been stabled some distance away, but new stables will be erected behind the engine-house. The next stage in the alterations will be to add an additional storey to the police barracks.

At a meeting of the Mersey Docks and Harbour Board on the 2nd inst. the works committee brought forward a recommendation which involves the construction of a new graving

dock at the south end of the Board's estate. It was stated that the new dock is to be constructed on land immediately adjoining the present Herculeaneum graving docks, and that it will be worked by the pumping system already in operation there. It is proposed to make the sill of the dock 3½ feet deeper than that of the older docks. It was pointed out that the new dock, while under construction, would not interfere with the working of any of the other docks in the neighbourhood, and that several very desirable improvements might be carried out in connection with it. The new dock is to be constructed by contract. The recommendation of the committee has the approval of the Board.

A SITE has been secured for new post offices at the junction of Little Park and Church Streets, Enfield. A more convenient and central spot could not have been selected. The present offices are a part of the fine old Tudor building known as the Royal Palace. The south wing, with its tall brick chimneys, still remains, and within there are richly ornamented ceilings, oak panelled walls and a massive chimneypiece on Ionic and Corinthian columns, and here are seen the letters "E. R." (Edward VI.), with the arms of England and France quartered, the rose and the portcullis, and the lion and the gryphon. At the rear of the old building stands the largest cedar tree in this country, and the seed of it, from Mount Lebanon, was the first brought and reared in England.

AN inquiry was held at the Council Chamber, Camberley, on the 31st ult., by Colonel C. H. Luard, R.E., Local Government Board inspector, respecting an application of the Frimley Urban District Council for sanction to borrow 6,000*l.* for purposes of sewerage and sewage disposal. The circumstances leading to the necessity for the application were explained by Mr. A. M. Kennett, clerk to the Council, and the scheme was described by Mr. F. C. Wren, surveyor, and a representative from Messrs. Adams & Co., sanitary engineers, Westminster, described the sewage lift. The scheme provides for the diverting and relaying of a portion of the existing sewers, and the automatic raising of the sewage to the farm, where it will be treated in a series of bacteria beds, which are to be filled and discharged automatically. The inspector subsequently visited and examined the sites of the proposed works.

THE Coventry Master Builders' Association have served notices upon the men engaged in the various sections of the building trade of an intended reduction of wages and an alteration of working hours. This applies to bricklayers,

carpenters and joiners, also to painters, stonemasons, plasterers and labourers. In some cases the proposed reduction amounts to three-farthings per hour, in others a halfpenny. Such notices have, according to the rules, to be sent in by December 31. Last year, it will be remembered, similar notices were issued, and the matter went to arbitration. The arbitrator held, however, that the notices were received a day too late, and they were consequently withdrawn. The change in the working hours relates more especially to the winter months. The masters are desirous that in certain months the working hours shall be from eight o'clock in the morning till four in the afternoon. They also propose that on Saturdays work shall cease at one o'clock all the year round, instead of at twelve, as at present. The reason for this is that where men are engaged in some outlying district they have to cease work very much earlier than usual in order to reach the city by noon, at which time wages are paid, thus making the hours of labour on Saturday very short. The bricklayers and carpenters and joiners have, on the other hand, it is stated, sent in a demand for an advance of wages. Both notices will be considered in due course.

At Selly Park, Birmingham, on the 2nd inst., the foundation-stone was laid of a new Roman Catholic church which is rising at the corner of Bournbrook and Elmdon Roads. The church, which is dedicated to St. Edward, will, when completed, afford seating accommodation for a congregation of about 500. The plans adopted are for a church in the early decorated style of English Gothic, comprising a nave 82 feet long, 30 feet wide and 50 feet high, two aisles equal in length to the nave and each 11 feet wide, and an apsidal-ended chancel 30 feet in length, of the full width of the nave, and separated from it by a lofty and richly-moulded chancel arch. At the east ends of the north and south aisles respectively will be the lady and Sacred Heart chapels, and at the west end of the nave there is to be a spacious vestibule, over which will be placed the choir gallery. The baptistery will be at the west end of the south aisle, and at the west end of the north aisle will be situated the tower, surmounted by an imposing spire, while the sacristy block, containing priests' sacristy, working sacristy, confessionals, &c., is to be placed against the wall of the south aisle. The nave will be separated from the aisles by lofty arcades of five bays, the arches being of stone and resting on octagonal stone piers. The nave roof, which will be open to about two-thirds of its height, is to be carried by hammer-beam roof trusses with arched ribs, and the aisle roofs will be supported by transverse stone arches springing from the aisle walls and the piers of the nave arcades. The sides of the apse will each contain a three-light traceried window and an elaborate window of a similar character is to be placed in the west gable. The aisle windows will consist of groups of three lights, with cusped heads, and those of the clerestory of two lights, with simple tracery in the leads. Built mainly of brick, the church will be faced externally with sand-stock facing bricks and internally with plaster. The woodwork will for the most part be of pitch-pine, and the roofs are to be covered with Preceley green slates, while the floors under the seats will be laid with wood blocks, and those of the nave and aisle passages with terrazzo marble mosaic. As the building fund does not permit of the whole scheme being carried out in its entirety at present, the nave, aisles and sacristy are to be erected first, and the contract for this work, which amounts to about 4,200*l.*, has been accepted by Mr. W. Bishop, of King's Heath.

### FLORENTINE QUARRIES.

ACCORDING to the British Consul-General, in the province of Florence there are 202 stone quarries in actual work, four of which are serpentine (*verde di Prato*), five calcareous stone (*alberese*), two grindstone (*enfolide* or *granitone*), five fireproof stone, three calcareous stuff, 170 "arenaria" (hard greystone for olive presses), eleven building stone (*pietra forte*) and two majolica earth.

The serpentine (*verde di Prato*) serves for architectural and ornamental purposes. These quarries, situated at Monferrato, near Prato, have been worked from a very early date. In 1365 they were taken on lease by the Opera del Duomo to employ the stone in ornamental works on the cathedral. At present they are in the hands of two private persons, and their output (valued at 1,000*l.* per annum) is almost entirely used in Florence partly for repairs to the cathedral and other churches of the city, and partly in making statuettes, bowls, vases and other ornamental objects.

With regard to the calcareous stone (*alberese*) some is cut into flags for street paving, and the remainder is employed in masonry in its original state, or else reduced into chippings and utilised in the metalling of roads. The average output of these quarries may be calculated at about 3,200*l.* per annum.

The tuff is utilised as a very common building stone, the greater part being reduced into gravel.

The arenaria stone, including the varieties of "macigno" and "pietra forte," enjoys an excellent reputation as a first-class architectural and building stone; the largest output is obtained at Fiesole, Carmignano, Lastra a Signa and Galluzzo. The Fiesole quarries alone give an approximate annual output of 10,400*l.* The total number of quarries is 1,300. This stone is frequently used outside Tuscany, and even exported abroad.

### BIRMINGHAM UNIVERSITY.

THE annual report which was submitted to a meeting of the Court of Governors of the University of Birmingham on Wednesday, stated that at the commencement of the year a University buildings committee was appointed, to which was referred the consideration of the report of the former advisory committee. Mr. G. H. Kenrick was appointed chairman. The Council having approved the plans prepared by Messrs. Aston Webb & Ingress Bell for utilising the land presented by Lord Calthorpe, considerable progress had been made in the formation of the road and preparation of the site. The tender of Messrs. Currall, Lewis & Martin, amounting to 4,556*l.* 2*s.* 10*d.*, for the construction of the new road, was accepted, as also their price of 1*s.* 7*d.* per cube yard for levelling the site. The generous grants made by the Corporation of Birmingham and the Staffordshire County Council had enabled the Council to proceed at once with a larger portion of the University buildings ultimately contemplated than would have been possible without such support. It had been decided to erect in the first instance a University hall of large dimensions (150 feet by 75 feet) and three departmental blocks, two on the west and one on the east side of the hall; the whole fronting to the arc of a semicircle, the diameter of which is University Road. In these buildings it was proposed to instal a complete engineering department, including mechanical engineering, civil engineering and electrical engineering, which would occupy two blocks, while a third block would accommodate the new departments of mining and metallurgy. In another part of the ground would be built a power station, and also a forge and foundry, all three being connected with the engineering department.

The Chancellor (the Right Hon. Joseph Chamberlain) in the course of his speech said:—

I have ventured to urge upon my colleagues great boldness in regard to expenditure, and above all, in regard to the plans for the new buildings which we are about to commence. I want that we shall build—and in this I am happy to say that we have received the unanimous support of my colleagues—I want that we shall build for the future and not only for the present, and above all, that we shall so build what we now undertake that we shall not compromise in any way the possibilities of the future. I have in my mind the action of the builders and founders of those magnificent cathedrals which have come down to us from the Middle Ages. Not one of them was built at once, but all were built with a view to the greatest possible extension. Our ancestors, if they had not the money to complete the work, were satisfied to build a transept or a nave or a portion of the church, but always on a scale that when complete it should be worthy of its object. Ladies and gentlemen, we propose to follow that example. We propose to build a portion such as our funds will enable us to lay down, but each portion will be on a scale which shall be equal to our highest anticipation of what the future may have in store for us. We have received from our architects the rough plans of our future University—of the University as it will be perhaps a generation hence, perhaps to-morrow if we can only find in this country some individuals who are ready to follow the munificent example which has been set by American millionaires in similar circumstances, and who may be proud to associate their name with the completion of so great and important a work. In dealing with such large sums any estimate must be very perfunctory, but I reckon that the buildings of this new University cannot be erected and equipped for a less sum than a million sterling. We have 300,000*l.* in hand, and accordingly out of ten working blocks of which the University buildings will ultimately consist we propose to begin with the erection of three. These three blocks will give us the schools of mining, of metallurgy and of civil, mechanical and electrical engineering. They will also give us the great hall of the University, which will be necessary for such meetings as this, for examinations, for refectory and possibly for other purposes. We have arranged to-day for an exhibition of the plans by means of the magic-lantern, and at the conclusion of this meeting they will be thrown so far as they are complete upon the screen, and the character of them

will be explained to you; but I must warn you beforehand that they are very incomplete, and that they may, as the work goes on, be subject to further alteration, but they will perhaps be sufficient to give you a general idea of what we intend.

## WEST MOLESEY HOSPITAL FOR INFECTIOUS DISEASES.

MR. ARNOLD ROYLE, C.B., an inspector of the Local Government Board, held an inquiry at the Molesey District Council offices recently into the application of the Council to borrow 900*l.* for the purchase of a site for an infectious hospital at West Molesey. Mr. D. Cann (clerk) said that the greatest proof of the necessity for the hospital was the fact that the Council were continually spending sums of money on nurses and the isolation of poor people suffering with infectious disease. Although this was done under the advice of the medical officer, the Local Government Board had surcharged him (the clerk), the money having been paid out of his petty cash. Up to the present time the Council had paid over 50*l.* for such treatment. Originally West Molesey was a partner in the Tolworth Isolation Hospital, but they sold their interest to Surbiton for 1,356*l.*, which sum had been invested and earmarked for the purpose of building a hospital. Under an agreement West Molesey had the right to send patients to the Tolworth Hospital for a period of five years. It was proposed to utilise that sum, and later on the Council would submit plans for the erection of a hospital at an estimated cost of 1,350*l.* Mr. H. J. Robinson said the piece of land they proposed to purchase was the only piece procurable. They had to pay 550*l.* for the freehold of the land. Part of it was under cultivation, but they had arranged for the whole of the orchard to be at once given up on the payment of 700*l.*, so that they would have to ask the Local Government Board's sanction to borrow 1,260*l.* instead of 900*l.* They were not applying for a loan for building. The West Molesey money would be utilised for that purpose, and the remainder would be raised from the rates. East Molesey would, of course, have to reimburse West Molesey. Dr. J. E. Knox gave it as his opinion that the site was a very good one. The inspector said the Local Government Board would require an undertaking that smallpox patients would not be admitted to the hospital, and the

chairman thought the Council would be willing to give this. The surveyor, having given evidence as to the suitability of the site, and as to the price being reasonable, the case for the Council was closed. The Rev. Peter Ward said he hoped the Local Government Board would see that the expenses were properly adjusted between the two parishes, and he trusted that they would take into account any injury that might be done to West Molesey by the establishment of an infectious hospital in their midst. Mr. W. B. Barclay said he was strongly opposed to the site. The inquiry then terminated, the inspector and officials proceeding to view the land.

## THE NEW ADMIRALTY BUILDINGS.

IF one may judge of our Navy by the increase of staff and the expansion of headquarter facilities at Whitehall, says the *Daily News*, that Navy certainly ought to be growing in strength and efficiency rapidly enough to satisfy the most ardent of Imperialists. When, after a good many years of deliberation, it was finally decided to supplement the old Admiralty by new buildings, it was resolved to do things handsomely. Two fine blocks of buildings were to be erected. The first, looking out westward along Birdcage Walk and St. James's Park, was to cost about 200,000*l.* This was completed and occupation commenced in July, 1895. Whether the second block was absolutely decided on at the outset we are not quite sure, but if not it was recognised as an addition that might have to be made, and long before the first pile was completed on the west of the quadrangle behind the old Admiralty, it was decided to erect another on the north of the quadrangle, leaving the south side open to the Horse Guards Parade except for a covered corridor running across to connect the south ends of the old Admiralty and the first of the new supplementary blocks.

That for a time, it seems to have been supposed, would meet all requirements of the expanding service. So confident were the Government and Admiralty chiefs that this second addition would complete the establishment, and permit of all necessary readjustment and reforms, that it was resolved that the great north block and the corridor running across the south side of the quadrangle should be carried out simultaneously. But by the time that second great pile, with its hundred rooms—some of them very large—was well in hand, it began to be questioned whether, after all, accommodation

would be sufficient. Every new ship added to the Navy means an addition to the headquarter staff, and such additions were coming thick and fast. Moreover, it was only when they began to come in from the outlying buildings in which various branches of the service had been temporarily lodged that the severe compression under which the work of the Department had been carried on came to be fully realised. It was, we believe, intended that the Director of Works should have found accommodation in the second of the new buildings. That was found to be impracticable, and it was eventually decided to drop the idea of a mere connecting covered-way, and to set up a third great new pile of offices instead. That has been actually commenced, and Messrs. Chessum & Son, of Bow, are now engaged upon the foundations. The architects of this third erection are to be Messrs. Leeming & Leeming, who have carried out the other two blocks. The new pile will, of course, correspond with the edifice overlooking St. James's Park, the characteristics of which were largely dominated by the original old Admiralty building to which it was an addition.

This coming structure on the Horse Guards' side of the quadrangle will probably constitute the most important frontage of the modern Admiralty. While, of course, the general style of it will be that of the two other portions, it will be somewhat more imposing and elaborate, the money for it having been voted before the outbreak of the South African war. It is a pity that it should have been necessary to depart from the original idea of a low ornamental corridor along this side of the Horse Guards' Parade, for the open quadrangle would have been rather imposing from the outside, while the inside would have been much pleasanter and the backs of the buildings lighter and airier. But the addition has been found imperative necessary.

And even this great third block does not seem likely to be the end of the business. Already there is, we understand, a fourth addition in contemplation, and the probability is that before the Horse Guards' frontage has got far on its way a new building will be decided on to face Whitehall, and running down from the Park to the Paymaster's Office, thus effectually extinguishing Ripley's ungainly pillars and pediment which the screen on the street-frontage line was erected in some measure to mark. The old Admiralty buildings there is no thought of disturbing, but if this final project is carried out, these old and interesting offices, from which the British Navy was controlled in its most famous days, will form only the central point of a

great modern institution flanking Whitehall on the west, as the War Office will soon flank it on the east. This final erection would, of course, have to be not only extensive, but, from its position on a main West-end thoroughfare, must necessarily be imposing and elaborate, and therefore very expensive. It is hardly to be expected that money will be voted for it till we can see the bottom of our little business in South Africa.

### WOLVERHAMPTON WATER-SUPPLY.

A PUBLIC meeting of the owners and ratepayers of the borough was held in the Free Library Lecture Hall, Wolverhampton, on Monday evening, to consider the expediency of the Corporation promoting a Bill in the ensuing session of Parliament to extend their water undertaking and obtain powers to raise money for that purpose. The mayor (Mr. C. P. Plant) presided over only a few people, and the proceedings were of a most formal character.

His Worship, in opening the proceedings, said it would appear from the small attendance that the ratepayers were in favour of the object the Corporation had in view.

Alderman Marston, the chairman of the water committee, explained the objects of the Bill, and traversed the ground he covered when relating the scheme to the members of the Town Council a few weeks ago. He explained that a similar Bill was introduced into Parliament twelve months ago, and the facts had not been altered. The town required a further supply of water, as the population was gradually increasing, and the Bill last year would have been passed but for a misconception as to the meaning of the compensation clauses. It was then intended to give compensation to all who had water taken away from them, but Parliament misunderstood the purport of the Bill and threw it out. Compensation clauses were again inserted, and, judging from the negotiations which had passed with the owners of property, there was reason to believe that a friendly arrangement would be come to before the Bill was brought to a second reading. This year the clauses relating to extending the limits of supply had been eliminated, and it was not intended to increase the water area. With regard to compensation, it was now proposed to supply water to any house or residence within two miles of the site of the works in case, through the operations of the water committee, the water was taken away from them. In addition, the water would be laid on to the houses without

ny charge whatever. It was also proposed to supply local authorities with water at a fair rate per thousand gallons, so that they would be able to supply the residents in their districts which were short of water at a reasonable rate. In other respects the Bill remained the same as that of last year. They were asked last year to go to Birmingham for a supply of water, and that question had been considered, and interviews had taken place with the Birmingham authorities, who had given them every consideration to become customers. It was thought, however, that water could be got cheaper from Hilton and Stapleford. The Birmingham water, too, would have to be treated at a further expense. The Birmingham Corporation proposed to charge 6d. per 1,000 gallons. That was considered a low price considering the enormous cost of the Birmingham scheme, but if Wolverhampton took 1,000,000 gallons a day it would cost 10,000l. per annum, and that amount would be too great. The new scheme of laying down pumping plant at Hilton and Stapleford, together with tramway and reservoirs, would cost 149,000l., and for new mains and other works 101,000l. would be required, so that it was proposed to ask for 250,000l. Up to the present time the waterworks scheme had realised a profit, and it was not anticipated that the new works would necessitate any call on the rates. The Mayor then moved a resolution in favour of the Bill being promoted, and this was seconded by Alderman Joseph Jones, and carried without a dissentient voice.

### NEW ASYLUM FOR YORK.

A NEW asylum for York having become a very pressing need, the asylums committee of the Corporation have issued the following *résumé* of the history of the project for the erection of such an institution:—

It having become necessary that the city should provide an asylum of its own for the reception and maintenance of its pauper lunatics, the finance committee in 1899 advertised for particulars of price, &c., of estates of not less than 50 acres, in a ring fence, within a radius of ten miles of York, suitable for the erection of an asylum. Several offers were submitted, and the committee having considered the same decided to recommend the Council to purchase Acres House Farm, Naburn, comprising 140 acres, for 12,350l. The Council adopted this recommendation on August 14, 1899, the purchase being, however, subject to the approval of the Lunacy Commissioners and

the Home Secretary, and to the sanction of the Local Government Board for borrowing the necessary money, application for which was directed to be made by the Council.

Dr. Needham, one of the Lunacy Commissioners, officially inspected the farm, and a copy of his report was printed for the information of the Council, together with a letter from the secretary of the Commissioners, intimating that on receiving the assurance of the committee mentioned in Dr. Needham's report the contract for the purchase of the farm would be forwarded to the Home Secretary for approval.

The assurance referred to was that the committee had satisfied themselves that they might erect the proposed asylum on Acres Farm without risk of danger or inconvenience to its inmates by the proximity of the sewerage works of the city. This assurance was given and the approval of the purchase of the land by the Home Secretary was obtained.

The Local Government Board also gave their sanction to the borrowing of the purchase money, after one of the Board's inspectors had held a local inquiry in respect thereof, the period of repayment extending to thirty years.

With a view to improving the boundary line of the property, and so that all the buildings might be in the parish of Fulford Water, the Council on the recommendation of the committee subsequently purchased from Captain Key additional land, to the extent of 15a. 1r. 13p. and 25 yards, for the sum of 1,303l. 11s. 10d. The Local Government Board has granted sanction for borrowing the money, repayable in thirty years.

In November 1899 the committee considered the question of the appointment of an architect for the asylum, but before coming to any decision it was decided that they should visit and inspect the asylums at Middlesbrough, Sunderland and Beverley, and they accordingly visited those institutions.

On the recommendation of the committee, the Council on February 5, 1900, appointed the city engineer as the architect for the asylum, and Dr. Pope, the medical superintendent of the Middlesbrough Asylum, was subsequently retained to advise in connection with the plans at a fee of 150l. The city engineer was to be allowed the necessary clerical assistance in the preparation of the plans, &c.

The city engineer accordingly proceeded to prepare the necessary plans of the new asylum, which it is intended shall provide for the accommodation of 362 patients, with an ultimate increase to 486.

The preliminary plans were submitted to the Lunacy Commissioners in June 1900, and after considerable delay and some

modifications therein to meet the requirements of the Commissioners they were ultimately approved. This fact was reported to the Council on October 7 last, when the plans were also submitted for and received the approval of the Council, as required by the Lunacy Act. The complete plans have now been submitted to the Lunacy Commissioners for their provisional approval. The committee are considering the system of heating and ventilation to be adopted at the asylum.

The committee add that arrangements are being made with the North Riding Asylum and the Bootham Asylum for the renewal of the contracts for the reception of pauper patients.

### CARDIFF NEW TOWN HALL.

IN 1878 the Cardiff Corporation obtained power to borrow 850,000*l.*, and of that sum 200,000*l.* was for the purposes of the new town hall and law courts. Owing to an alteration in the design of the new buildings, by raising the elevations, the estimate of 200,000*l.* has been exceeded by 33,000*l.*, and the total amount sanctioned to be borrowed under the Act has been exceeded by 38,548*l.* 16*s.* 8*d.* The Corporation, therefore, applied to the Local Government Board for a provisional order to remove the limitation of the borrowing powers imposed by the Act. Last week Col. Slacke was engaged at the town hall for close upon three hours in holding an inquiry into this matter. Opposition was offered by Mr. J. B. Ingledew (on behalf of the Taff Vale Railway Company), Mr. S. Hern (in the interest of the Cardiff Property Owners and Ratepayers' Association), Mr. Isaac Watkins for the Cardiff House-owners' Association, and others.

The Mayor was first called upon to give evidence, and referred in detail to the progress which the town had made, and said he saw no prospect of a diminution in the rate of commercial progress. Since 1875 the capital expenditure of the Corporation upon public works and other improvements had amounted to 2,638,995*l.*, and the total indebtedness of the borough was 2,470,795*l.* 16*s.* 3*d.*, including waterworks, tramways and electric lighting. In 1898 the Corporation promoted a Bill for powers to purchase Cathays Park, on which to erect a new town hall and law courts. The proposal was passed with great cordiality at a meeting of ratepayers. By the Act of 1898 the Corporation were authorised to borrow amongst other amounts any sum not exceeding 200,000*l.* for erection of town hall and law courts. By section 59 it was provided that

the Corporation might borrow for the purposes named (except tramways) and for furnishing the town hall and law courts such further sums as might be sanctioned by the Local Government Board. Under the Act the total amount to be borrowed could not exceed 850,000*l.* With regard to the sum of 200,000*l.* for the town hall, &c., it was ultimately found that those buildings would cost 233,000*l.*, and the Local Government Board sanctioned the borrowing of an additional 33,000*l.* under the Cardiff Corporation Act, 1898. In the early part of the present year it was found necessary to apply to the Board of Trade for sanction to the borrowing of further moneys for tramway purposes under the powers of the Act of 1898, and therefore they had been authorised to borrow 888,548*l.* 16*s.* 8*d.*, or 38,548*l.* 16*s.* 8*d.* in excess of the maximum sum stated in the Act. The Corporation had therefore been authorised to borrow sums to the amount of 30,570*l.* beyond the borrowing powers stipulated in the Act, and in order that the matter might be immediately dealt with an satisfactorily arranged the town clerk was instructed to ask the Board to consent to their sanction in respect of 33,000*l.* being borrowed under the powers contained in sections 105 and 106 of the Municipal Corporations Act, 1882, instead of under the Cardiff Corporation Act, 1898. The Council had decided upon this course inasmuch as in the estimate of the borough engineer for the Act of 1898 no provision was made for any expenditure on the town hall beyond the sum of 200,000*l.* mentioned in the Act. The Board, however, could not consent to this transfer, and as it would be necessary hereafter to approach the Board for the borrowing of moneys for the furnishing of the town hall, the Council came to the conclusion that it was very desirable that all moneys in excess of the 200,000*l.* specifically appropriated under the Act of 1898 for the new town hall should also be borrowed under that Act, and considered it desirable to amend the Act so as to make provision for further borrowing powers. The power to borrow would only be used with the sanction of the Local Government Board.

Mr. Lanchester, the architect, gave particulars showing how the increased cost had arisen. Besides raising the height of the façade and the right-angle pavilions, there had been increased strong-room accommodation provided, larger rooms for the borough engineer's and health superintendent's department, additional offices in the water rentals department, private lavatories for head officials, two extra rooms in the town clerk's department, luncheon-room, &c.

Mr. H. M. Ingledew then submitted his objections. He intended that the object for which this money was required should not come within section 303 of the Public Health Act, that there was a debt of over 775,000*l.* over the two years' assessable value, and that therefore the Local Government were barred from giving the power sought, and, further, that all ratepayers assented to was a maximum expenditure of 10,000*l.* The company he represented, the Taff Vale, paid one-twentieth of the rates.

The Town Clerk said that the Corporation's local Acts proceeded against the objection Mr. Ingledew had raised as to the total indebtedness exceeding the two years' assessable value to the objection under the Public Health Act, all Corporations had power to erect suitable offices and buildings. He denied that the rates had gone up during the last three years, and said the ratepayers would not have wished the Corporation to spoil the new town hall for the sake of a few thousand pounds.

The inquiry then closed, and the result will be made known due course.

### WINWICK ASYLUM, LANCASHIRE.

LAST week the opening ceremony in connection with the new Lancashire asylum was performed. The estate on which the building is erected is known as Winwick Park, and it was purchased from the Ecclesiastical Commissioners in 1894 for 100*l.* Brickmaking was begun in 1896, and in October 1897 Messrs. Neill & Sons, of Manchester, signed the contract for the building of the asylum for 253,000*l.* The progress of the work has been delayed on several occasions by strikes. It is hoped, however, that it will be quite completed within a few months. What remains to be done is principally furnishing and laying out the grounds. The accommodation is for 2,000 inmates—1,000 males and 1,000 females—with 200 attendants. The buildings comprise an administrative block in the centre, and the pavilion system has been adopted. The various parts of the building are connected with the administrative block by long corridors. The length of the corridors is in all seven miles. There are two wings. A short distance away on the Warrington side there is an isolated hospital for infectious diseases, and on the Newton side is a row of houses for the officers of the asylum. The whole of the buildings are lighted with the electric light. There is a generating station on the premises

with three dynamos, which also supply the power for working the laundry. A large water tower with large water tanks is provided in case of fire, and there is also a tower for condensing steam to prevent any inconvenience arising from steam escape. A very complete laundry and cookery establishment, a large recreation hall, a church with accommodation for 800 people, and a railway siding connected with the London and North-Western Railway are among the other provisions. At the present time there are fifty imbecile children in the old hall.

At the opening ceremony Mr. Francomb, chairman of the visiting committee, in an interesting address alluded to the fact that there had been a large amount of extras in the contract, and they were chiefly extras in the foundation, the soil of the district having proved to be very treacherous. The site cost 22,130*l.*, for which they had over 200 acres of freehold land. For railway bridge they had spent 2,094*l.* Twelve cottages and two lodges had cost 5,292*l.*, the brickmaking 25,450*l.*, the building 276,400*l.*, the electric lighting 13,732*l.*, architect's, quantity surveyor's and engineers' commissions 15,754*l.*, the salaries of the clerk of the works and assistants 2,000*l.*, the new farm building 8,180*l.*, the alteration to the old farm buildings 2,550*l.*, Warrington Corporation for gas and water mains 1,075*l.*, making a grand total of 382,955*l.* That was at the rate of 200*l.* per bed, and he was assured by Dr. Rhodes that it was almost the cheapest asylum ever built. They had been building about four years, and would have been finished before now had they not been terribly bothered with strikes.

### VAUXHALL BRIDGE.

IN the City of London Court, on Tuesday, before Mr. Lumley-Smith, K.C., actions were brought by Messrs. Pethick Brothers, who are constructing the new Vauxhall Bridge over the Thames, against Messrs. William Cory & Sons, Ltd., 52 Mark Lane, E.C., and the Thames Steam Tug and Lighterage Company, to recover 50*l.* and 20 guineas respectively for damage done in collisions. It appeared from the evidence that the plaintiffs in October last were driving 50-foot piles into the river at Vauxhall to form a coffer dam, and the works were properly lighted. The tug *Rajah* came up in the dead of the night and smashed two piles, involving an expense of 50*l.* The second defendants allowed a barge to run into the plaintiffs' pile-driving machinery, when damage

NO DANGER.

Mr. D'O'LY CARTE, of the Savoy Theatre, writing of these Stoves, says:—"I used your Hygienic Gas Heating Stoves in this Theatre all last winter, and found them in every way most satisfactory. I think I must have had ten or a dozen of them in various parts of the Theatre, and in the very cold weather we had last winter they succeeded in warming the corridors, &c., admirably. Two of them were used to heat the Business Offices of the Theatre, and they fulfilled this object capitally, while apparently in no way injuring the air in the offices—a most important consideration."

to the amount of 20 guineas was done. The defendants' case was that the rebuilding of Vauxhall Bridge had given rise to a great many accidents, and that they ought not to be held to blame for what was unavoidable. The contractors took up a great deal of the fairway of the river, and it had become a great danger to navigation. It was very hard on the owners of barges and other craft using the river daily. The Judge said for craft to get by Vauxhall Bridge was like driving along Cheapside with the road up on both sides. Corys' tug *Rajah* ought not to have had so many tugs fastened to her. Defendants' counsel said that if that argument were to prevail a man with only one eye should not go along the Strand because it was densely crowded. The Judge said the tug did not give the piles a sufficiently wide berth. He must find for the plaintiffs in the first case for 45*l*, and in the second for 20 guineas. In a third case the contractors recovered 5*l*, costs following in each action.

### PLUMBERS' NIGHT WORK.

THE following opinion by Sheriff Balfour has been given in a reference between the Master and Operative Plumbers' Associations in Glasgow with reference to a dispute which arose out of the Glasgow Exhibition work, regarding the question as to payment of operative plumbers for work done by nightshift. The opinion explains the circumstances, and is as follows:—

"This arbitration applies to a dispute which has arisen between the Master Plumbers' Association and the Operative Plumbers' Association, and the circumstances are as follow:— Certain operatives were employed by Mr. Renfrew, the plumber, at the Glasgow Exhibition, and in consequence of the requirements of the Exhibition they were unable to work during the day. On Tuesday, June 18, 1901, they stopped work at 1 P.M., and started again at 9 P.M. the same evening and worked all night until 9 A.M. the following morning (Wednesday), when they stopped work, and did not resume again until Wednesday night at 9 P.M. The men continued working at night from 10 P.M. until 9 A.M., with two breaks of half an hour each night for meals, until Saturday, June 29. They were then paid on the footing of receiving the usual wages for fifty-one hours per week and time and half for the time wrought after the fifty-one hours. They received the payment under protest and

claimed to be paid time and a half for all night work, without reference to working fifty-one hours in the week. The rule applicable to the working time for Glasgow, as agreed upon between the parties, and which came into operation on May 1901, have been submitted to me, and according to these rules the working hours from February 16 to November 14 are from 6 or 6.30 A.M. to 5 P.M., taking two hours for breakfast and dinner, for the first five days of the week and on Saturdays from 6 or 6.30 A.M. to 1 P.M., taking an hour for breakfast. With regard to overtime, the rule is that all time wrought after fifty-one hours per week from February 16 to November 14 is to be paid at the rate of time and half. There is nothing said in the rules as to night shift, that is, as to men working only at night and not during the day. The rules provide for the men working during the day and completing fifty-one hours per week, and for any work done in addition to the fifty-one hours they are to be paid time and half, and there is no rule that the men are to be paid time and half for night work alone. The rules do not therefore apply to the dispute which has arisen, and the question arises as to what is a fair and reasonable sum for Mr. Renfrew to pay to men who have been engaged in night-shift work alone. It is clear that the men are not entitled as a matter of contract to time and half for the whole night work, and what Mr. Renfrew has done is—he has paid the men the usual wages for the fifty-one hours per week of night work and time and half for the surplus over the fifty-one hours per week, and further, Mr. Renfrew has offered them 1*s*. per night extra for working during the night, which the men have refused. It appears to me that, in the absence of any rule on the subject, the payment already made by Mr. Renfrew, along with the offer of 1*s*. per night extra, is a fair and reasonable offer, and should be accepted by the men, and that the men are not entitled to time and half for the whole of the night work. With regard to the four cases in which the operatives state that men were paid time and half for night work I do not think that these cases are sufficient to establish a custom of trade. It is unnecessary to deal with the alleged compact made by the leading hand, James Watson, on behalf of the men, because although it is averred by Mr. Renfrew that a compact was made by Watson that the men were not to receive any allowance beyond time and half for the surplus over fifty-one hours per week, this is denied by Watson, and the men say that he had no power to enter into such a compact on their behalf."

# PROUT'S CONTINENTAL SKETCHES

*Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 42*s*. Net.*

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the

## PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to the Drawings, says:—

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest."

"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverent enthusiasm."

"The sharpest photograph is not half so natural."

"No architect, however accurate in his measurements—no artist, however sensitive in his admiration—ever gave the proportion and grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately: there are no existing true records of the real effect of Gothic towers and spires—except only Prout's."

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

# The Architect.

## THE WEEK.

THE *Gazette* on Tuesday announced that a petition was presented to the KING for incorporating "The British Academy for the Promotion of Historical, Philosophical and Philological Studies." To some extent this is a revival of a more consolidated form of the scheme for the foundation of an institution resembling the Académie Française. At the beginning of the reign of GEORGE III. it took the title of the Academy of Minerva, and there was a belief among wits that Dr. JOHNSON would be the Grand Owl. About thirty years ago public attention was directed to the question by an essay of MATTHEW ARNOLD on the influence of academies. The academy that is now projected will not, however, concern itself with polite literature; it will deal with such serious subjects as moral and political sciences, history, philosophy, law, politics and economics, archæology and philology. The necessity of such a body was manifested at meetings of the European and American academies, when it was found that the Royal Society, which was the representative of Great Britain, was devoted to science rather than to philosophical, philological or historical studies. A British Academy was founded as the result, but as it possesses no official standing, application has been made to HIS MAJESTY for incorporation by royal charter. Among the first fellows named in the draft charter are Viscount DILLON, President of the Society of Antiquaries, and Mr. ARTHUR J. EVANS, Keeper of the Ashmolean Museum, Oxford, who are the only representatives of archæology. The petition has been referred to a committee of the Lords of Council, to whom all petitions in favour of or in opposition to the proposed charter should be sent on or before February 14.

By section 145 of the London Building Act, it is well known that two clear days' notice is to be given to the district surveyor respecting every building or structure or work that is affected by the provisions of the Act or the by-laws. At first sight it might not appear that a street box for the purpose of inspection in connection with electric energy was such a building structure or work. But it has been decided by the High Court that such is the case. The Charing Cross and Strand Supply Corporation, Ltd., were a few days ago summoned before Mr. Alderman CROSBY at the Guildhall by Mr. EDWARD WOODTHORPE, district surveyor of the northern division of the City of London, for beginning certain works without having served the required notice. The Alderman convicted the company, and imposed a fine of 40s., with two guineas costs. The company are eager to have such a case argued before a special Divisional Court consisting of more than six judges. It may be inconvenient to companies to be subjected to visits from district surveyors, but a class of construction is now carried out below pavements and streets which can become as dangerous as any warehouse, shop, or private residence. There should be some control, and there are no officers so competent for the duty as the district surveyors. It is not to be expected, however, that important companies will be satisfied with the judgments given in police courts, especially when it is known that the magistrate has not had an elementary training in law. To remove all doubts and misgivings, it would therefore be well that the decision of the High Courts should be invoked.

If a statue should ever be set up in Brighton as a memorial to the Rev. A. D. WAGNER, who died on Tuesday morning, it ought to take the form of one of those mediæval priests who are represented as holding the model of a church as expressive of their predominant quality. In the nineteenth century he stood without a rival as a church builder. His father, who was also a Brighton vicar, set an example, for he erected Christ Church, All Saints Church, St. Paul's and the parish church of St. Peter's. Miss WAGNER had the old royal chapel removed stone by stone, and it is now known as St. Stephen's. The Rev. A. D. WAGNER was in his twenty-fifth year appointed by his father as vicar of St. Paul's, and he held that position for twenty-two years. He was known to have sympathy with

Mediæval ways, and as Brighton prided itself on its Puritanic orthodoxy, Mr. WAGNER was often attacked in the streets, and on one occasion an attempt was made to shoot him. He erected St. Mary Magdalene's, St. Bartholomew's, the Annunciation, the Holy Resurrection, and St. Mary's, Buxted, and endowed them and the schools connected with them. With his brothers he built and endowed St. Martin's Church as a memorial to his father. The extent of his outlay was never divulged by him, but it must have amounted to an enormous sum. The Church of the Resurrection is partly underground, for in order to escape the opposition of property owners in the neighbourhood it was necessary to have the nave between 30 and 40 feet below the street level. His enthusiasm was not confined to the building of churches. In order to meet the deficiency of suitable accommodation for the working classes he erected 400 houses, and then found that they were considered as too costly for the tenants. During his lifetime Mr. WAGNER endeavoured as far as he could to conceal his munificence, and some memorial should be raised as a tribute to a man who possessed many of the apostolic virtues and who was never weary of well doing.

THE announcement that a memorial, at a cost of 19,000 francs, is to be erected at Formigny will be a surprise to many visitors to Normandy. A memorial already exists of the battle which was fought in 1450, when the English army was defeated and Normandy ceased to be a British possession. It would be an advantage if the new memorial were to announce the circumstances in an impartial way. In 1446 the marriage of HENRY VI. and MARGARET, the daughter of RENÉ of Anjou, brought about the restoration, it may be only nominally, of the dukedoms of Anjou and Maine to the queen's father. The surrender, however, caused great discontent in England, as will be found described in the play of "Henry VI.," in which the national view is expressed by the speech of the Duke of YORK. He is made to say:—"Anjou and Maine are given to the French; Paris is lost; the State of Normandy stands on a tickle point, now they are gone." The Duke of SUFFOLK who carried the negotiations through was impeached, then banished, and his head was struck off while on shipboard. The rebellion of JACK CADE was one of the consequences of the general discontent with SUFFOLK. The French king was able to use Maine to attack Normandy, and by the defeat of Sir THOMAS KYRIEL the duchy was lost. In the course of a year Calais alone remained of all the English possessions in France. After so many years it seems hardly worth while to recall a battle in which the odds were immeasurably stronger on one side.

A FEW years ago we described a process for producing Celtic interlaced patterns in decoration. A paper was read on the same process by Mr. THOMAS COOKE TRENCH at the Convention of the Association of Master Painters which has been held in Dublin. It has had a practical application in the church of St. Michael, Clane. The difficulty to be overcome is mainly the prevention of crossings of the ribbons at inapposite places. By the French system the artist first covered the space to be dealt with with lines crossing one another, and woven in and out like basket-work. He then proceeded to join all the ends, two and two together, and finally he obliterated crossings here and there, joining the ends thereby set free in a manner differing from that which they originally followed. Any one could join ends, any one could obliterate crossings, but the excellence of the pattern consisted in the skill with which those processes were carried out, and therein lay the art. The development of interlaced patterns is well adapted to occupy the leisure of amateurs. Men and women of that class could hardly be more innocently employed during their leisure hours than by adorning Irish churches, where there is no money to pay decorators, with the ancient forms, which easily can be made to appear as if they were without beginning or end. But if the work can in that way be produced gratuitously or for the cost of the materials employed, it is not to be supposed that members of the Association of Master Painters would undertake contracts on similar terms. Much is now said about the beauty of Celtic ornament, but there is a general agreement that its financial aspects must be carefully avoided.

## OLD MASTERS EXHIBITION. -II.

THE variety which we have pointed out as marking this year's exhibition, is not confined to the great gallery. It characterises the collection which is to be found in the rooms we have yet to describe. Each of them contains works which would be capable to form an independent exhibition on a small scale.

In Gallery No. IV. we first meet with a fine canal scene by AART VAN DER NEER. He was a seventeenth-century painter who had a predilection for villages that were found close to rivers or canals. In Holland his countrymen admired him most when he showed the effect of moonlight on the water. The picture in the Academy would serve for several places in Holland. The canal is lined by high trees, and there are signs of industry not only in the sailing-boat, but also among the fishermen in the foreground. A portrait by VANDYKE is unlike the majority of the painter's works, for he has selected a plebeian type of youth who, although holding books, is not sicklied o'er with the pale cast of thought of the student. JAN GRIFFIER'S *View on the Rhine* is another excellent river scene, and deserves attention from the interest attached to the painter's career. Originally he was a carpenter, next he became a tile-painter, then a flower-painter, and finally, a landscapist. He came to London soon after the Great Fire, and being fascinated by the Thames, he bought a yacht on which he lived with his family, and spent his time in painting scenes along the river between Windsor and Gravesend. Not until he had suffered shipwreck a couple of times did he settle on shore. The view on the Rhine has a suggestion of some of the castled crags, and helps to indicate how far men felt the beauty of the river in the seventeenth century. PIETRO FRANCESCO MOLA is represented by an able landscape in which, after the Italian manner, nymphs are seen bathing in a pool. In its present condition the trees are the best part of the work. Although a landscapist, he gained some distinction as a painter of historic incidents, and in the National Gallery there is a *St. John Preaching in the Wilderness* by him. He was the son of an architect, and in Rome was elected President of the Academy of St. LUKE. The *Sibyl*, by GUIDO, is one of those heads of young women which GUIDO loved to paint, and of which the so-called *Beatrice Cenci* is the best known example. They form a class of work which might easily have been produced during the period when the artist was in a state of thralldom to picture dealers, and was compelled to produce a stipulated quantity of work every day. Although the *Sibyl* is described as having "white and blue drapery," very little blue is to be seen, for one peculiarity of the series of heads is that they wear white head-dresses as well as white robes.

Although *The Last Supper* by TITIAN is no more than a sketch for the large picture which was painted for PHILIP II., it deserves to be considered as a masterpiece. The larger work was sent to Spain in 1554. The painter had then passed his seventieth year. According to the letter which the artist wrote, it occupied him almost continually for nearly seven years. The canvas had to be cut down in order to fill the space in the refectory for which it was intended. TITIAN must have been aware of the arrangement of DA VINCI's fresco in S. Maria delle Grazie, and endeavoured to rival it. He also shows the figures seated at one side of the table, but they are less formally grouped. Instead of the simple surroundings which TITIAN employed in his *Supper at Emmaus*, there is an immense arch behind CHRIST, through which we see a fine landscape. The colours have faded, but originally this sketch must have been delightful. The large altar-piece by TITIAN belonging to Mr. PIERPONT MORGAN is in excellent condition. The VIRGIN looks over her shoulder at the Infant CHRIST, who blesses St. JOHN, and St. JOSEPH is contemplating the group. The faces do not appear to have been idealised, and convey the impression of being portraits. The Venetian School is also represented by the *Diana and Acteon* and *Atalanta* of PAUL VERONESE, besides a sketch measuring about 3 feet by 2 feet of TINTORETTO'S *Marriage Feast*, in the sacristy of S. Maria della Salute, which BURCKHARDT describes as "a magnificent genre picture of a domestic character (not princely, like P. VERONESE), in which at least the miracle

and its effects are in a praiseworthy manner placed in the foreground." It was one of the pictures which REYNOLDS must have had in his mind when he said the bustle of the Venetian School was, in MACBETH'S words, "A tale told by an idiot, full of sound and fury, signifying nothing." Students of the Academy have only to look at the three examples of TINTORETTO which are in the exhibition, in order to realise how prejudiced the first President could occasionally become in his criticisms. TINTORETTO sought to suggest active life, and he has succeeded to an extent that has never been excelled. There is another notable *Virgin and Child*, by FRA BARTOLOMMEO; a portrait of a lawyer, by GHIRLANDAIO; an excellent landscape by SALVATOR ROSA, which bears out the judgment of REYNOLDS, that there was a perfect correspondence between all parts of his works—rocks, trees and sky.

Sir PETER LELY is not the painter we should expect to see in an exhibition like the present, for, indeed, his beauties would be rebuked by the company of so many serious women on the walls. His one example is, however, to be excused, for it is a portrait of VANDYKE, whose influence made LELY abandon history pieces and landscapes for portraits. It may be doubted whether the portrait was taken from life. VANDYKE is depicted as a very young man, not more than twenty years of age at most, but when VANDYKE was twenty LELY was only twenty. Moreover, it is supposed that LELY did not see any of VANDYKE'S works until 1641, which was the year of ANTHONY'S death. There are portraits of two ladies by VANDYKE; one is represented holding a basket of flowers, and in both a great many pearls are introduced. Mr. PIERPONT MORGAN has lent a landscape by REMBRANT which is noteworthy for its beautiful trees. By RUBENS is *The Family of the Duke of Buckingham*. The duke was one of his English patrons, and possessed no less than thirteen of his paintings. It is possible the picture in the Academy was executed during the short stay of the artist in England. The children are admirably arranged, but the sadness of the duchess's expression is remarkable. At the time she was a widow, the duke having succumbed to the fanatical FENTON, and grief for her loss may have left so much trace. There is only one work by KNELLER in the exhibition, *A Portrait of the Earl of Bradford*. Of the years the qualities of the German artist have been depreciated, which is only a reaction from the idolatry which once surrounded him. The noble whom we see in the picture appears to have been riding, and the pose is natural; the colours, too, are quiet—a brown dress, white sleeves, lace collar and a fair wig. CANALETTO'S *St. Mark in Venice*, is like many other of his views of the city, for he has contrived to express the space and the stability of the buildings. Realistic landscapes are in favour. By MURILLO of a view across a valley to a wooded rocky height will give a new notion of his powers. *Painter and His Family*, by EMMANUEL DE WITTE, is one of the most charming of the representations of the domestic life of an artist. As a rule, he preferred to show interiors of a higher architectural character than his own dining-room, but the happiness which seems to surround the painter and his family would make a humbler room attractive. Another interior, and it may be of more pictorial value, is JAN STEEN'S *Grace before Meat*. Although REYNOLDS was no great admirer of the Dutch school, he said on one occasion, "JAN STEEN had a fine manly sense of painting that might become even the design of RAPHAEL." Examples of his art are rare in England, and on that account the Duke of RUTLAND'S picture should receive attention. It illustrates the homeliness of Dutch folk, and a commonplace scene is exalted by the reverence which is shown by the family while a mother teaches a child to repeat a prayer. All the details are treated with great care. The BORGias were an ugly race, and a sight of the medal containing a portrait of the notorious LUCRECE is sufficient to put an end to all the romance which has surrounded her history. The Cardinal GASPAR BORGI is represented by VELASQUEZ. VELASQUEZ does not appear to have been a criminal. CÆSAR BORGIA, who was also Duke of GANDIA, but whose portrait by VELASQUEZ will not diminish the aversion which the family is held.

There are only thirty paintings to be seen in the gallery. They begin with NICHOLAS POUSSIN'S *Bacchante*

*Italian Boys.* As a rule he preferred statuesque men and women or full-grown satyrs and fauns. The nine boys shown in the picture are rather adipose for amorini, and it is hardly reverential to childhood to suggest it can become intoxicated, but the picture is interesting as the effort of a grave man to treat an unaccustomed subject. MICHEL ANGELO's friend "Messer GIORGIO" was, like most Renaissance artists, endowed with versatility. His "Vite de' più eccellenti Pittori, Scultori, e Architetti," however, have insured for him an immortality which he could not have acquired by his pictures or his buildings. The portrait group belonging to Oriel College, Oxford, will on account of VASARI's name gain admiration, although many masterpieces may be hung near it. In it he has depicted DANTE, PETRARCH, BOCCACCIO, GUIDO, CAVALCANTI, MARSEILLO FICINO and ANGELO POLIZIANO, and there is so much vitality in the faces the painting does not altogether look like an imaginary conversation scene. The *Cleopatra* by GUIDO, and *Philip IV.* by VELASQUEZ, are among the numerous versions of those subjects. HONDECOETER's *Birds' Concert* is, as usual with him, very brilliant and not without humour, for the melody produced by an owl, a jay, a duck and a plover could hardly be seraphic. EUSTACHE LESUEUR was an admirable painter, but he exemplifies the ruth of WILKIE's remark, that no master has been able to uphold his reputation without skill in colour. The ability shown in the arrangement of the *Queen of Sheba* and the *Taking-up of St. Stephen* is unquestionable, but they are as cold in appearance as if they were intended to be placed in a Carthusian infirmary or mortuary. *Pharaoh's Daughter and the Infant Moses*, by TINTORETTO, is not remarkable for local truth, especially as we see a hunting scene in the background; it might have been one of those works which originally bore no relation to Scripture. The large altar-piece, *The Trinity*, by SANDRO BOTTICELLI, must have added in parts, because the figures now appear as if they were cut out of one canvas and pasted on to another, so marked is the contrast between them and the background. More interesting as a work of art is BERNARDINO CAVININI's *Virgin and Child with Saints*. He lived in the sixteenth century, and is said to have died in 1578. He was mainly devoted to fresco. Some say he followed GAUDENZIO, but there is no doubt he was an admirer of LEONARDO. In the picture in the Academy we seem to have a repetition in the foreground of the Child angel playing a violin, which was first attempted by FRA BARTOLOMMEO. There are various other amorini, and several figures of saints as well as of men and women, who may have paid for the picture. It is an admirable work, both for the modelling of the figures, the colouring and the composition. A third altar-piece of a similar character is by BARTOLOMMEO MONTAGNA, by whom several pictures are to be seen in Vicenza and Verona. The introduction of an apple on the foremost plane of the picture appears to be so erroneous that the figures will not receive the admiration they deserve. The colours have become darkened, but the reverential treatment and the austere spirit in the faces suggest that the artist was no ordinary picture manufacturer, and merits more renown than has been given to his lot.

Several portraits of Englishmen and Englishwomen are in the gallery. *John Chamber, M.D.*, belonging to Merton College, Oxford, shows a man of eighty-eight who still looks competent to give medical advice. It is in HOLBEIN's style, and may be classed with a portrait of a man which is ascribed to the German artist. The portrait of Queen ELIZABETH, from Jesus College, Oxford, evidently came from the hand of some able if unknown artist. There was a belief among her subjects that she was more than mortal, and such a picture would help the illusion. The full-length portrait of ANNE VAVASOUR, one of the Queen's gentlemen, is remarkable for the power shown in the face and the elaborateness with which the costume is executed. A portrait of EDWARD VI. is attributed to WILLIAM STRETES, who was the king's painter, and by whom he was paid marks for two portraits of his youthful Majesty. The lucky boy does not seem to be happy in his position. Another full-length portrait, attributed to VAN SOMER, is of Lady TANFIELD, the wife of a Chancellor of the Exchequer, and a pendant to it is Viscountess WILMOT. More is seen in another full-length *Lady Pope*, belonging to

Trinity College, Oxford. The portrait of Sir WILLIAM POPE is by MARK GERARD, of Bruges, who lived in England for over fifty years. He was the author of a book on drawing, which is believed to have been the first of its kind published in this country. The *Painter's Mother* is a work by REMBRANDT, and there is also a portrait of himself by Sir ANTONIO MORE, who was fond of that subject. The *Four Peasants* by VELASQUEZ are no doubt likenesses; they were studies for the *Bacchus* at Madrid. They are, however, coarse enough to raise revolt against realism, and should be placed in some pictorial chamber of horrors.

As there are over fifty oil-paintings in the Water-Colour Room it is evident they are all of smaller size than those seen in the other galleries. We have two of EMMANUEL DE WITTE's interiors of Dutch churches, one by VAN DER VLIET and one by SAENREDAM, which are shown with almost painful accuracy. In those days it was not uncommon to play games in churches or to bring dogs into them. GUERCINO's *Charity* would bear to be ascribed to CORREGGIO. The two small but exquisite sketches of Venice by GUARDI are marvels of handling. The head called *Martin Luther*, which is said to be the work of ALBERT DÜRER, is unlike the engravings after the paintings by HOLBEIN and CRANACH. The latter was a close friend of the reformer's, and his painstaking portrait is likely to be a faithful resemblance. According to HEINE, LUTHER was not only the greatest, but also the most German of all Germans, and in his character he represented the virtues and vices of the wonderful German people. He was at once a mystic and a man of action. Considered in that way, the engravings are more suggestive of LUTHER than the head in the Academy. The new portrait reveals a man of a different type, undoubtedly intellectual, but of far less courage and outspoken resolution. The *Bacchante*, by GREUZE, and *The Grace before Meat*, by CHARDIN, have been familiarised in various forms, and will be recognised as old acquaintances by all visitors. DAVID TENIERS, whether the elder or younger is not stated, must at one time have been in a prosperous condition. For he not only shows in a picture his château, garden and lake, but introduces in the foreground an allegorical figure of Abundance with four attendant Cupids, while not far off is an inn with the usual group of revellers; the combination is extraordinary. It would be an interesting question to discover why TERBURG's picture of the *Satin Gown* is universally admired. One reason may be given, which is, that we do not see the lady's face. It is a pity many other Dutch painters did not imitate his example. JACOB OCHTERVELDT was one of those artists who have had consideration for amateurs who are not Dutchmen. The *Lady Playing on a Harpsichord* in the Academy is shown by a back view; the dress is of white satin, with a black bodice cut low; but although the proportions are Batavian the picture is sure of general commendation.

The Black and White Room is occupied with drawings by CLAUDE, but there are four studies by RAPHAEL which mar the unity of the collection.

From our survey it will be evident that the exhibition now open will well repay the visits of all who can admire pictures. It was assumed that the Academicians would be forced to draw upon foreign collections, but with the exception perhaps of Mr. PIERPONT MORGAN, who probably would not wish to be regarded as a foreigner, all the contributors belong to this country. Among those who have contributed several pictures and drawings are Lady WANTAGE, the Duke of DEVONSHIRE, K.G., the Earl of NORTHBROOK, the Earl of BRADFORD, the Earl of LEICESTER, K.G., Viscount COBHAM, Viscount DILLON, Right Hon. LEWIS FRY, Sir E. J. POYNTER, Sir F. COOK, Sir J. C. ROBINSON, Sir W. AGNEW, Sir J. CARMICHAEL, Sir A. NIELD, Major CORBETT-WINTER, Major CHAMBERS, Captain HOLFORD, Mr. J. P. HESELTINE, Mr. J. KNOWLES, Mr. G. SALTING, Mr. R. BANKES and Mr. C. BUTLER.

**American Capitalists**, it is stated, have obtained concessions for electric car lines from Cairo to Mount Sinai and thence along the Arabian Littoral to Mecca. A branch is to connect Damascus with the system at Mount Sinai. It is believed that the traffic during a single annual Mohammedan pilgrimage to Mecca would pay a handsome profit on the cost of construction.

## THE GLORIES OF FRANCE.\*

AN interesting and useful acquisition would be an instrument, if one could be invented, which would gauge mental enjoyment in a way similar to that employed to determine the duration of sunshine by meteorologists. We are sometimes surprised to find that on what appear to be dull days an average amount of brilliancy is recorded, and we might also be able to discover if we possessed suitable apparatus that men who take their pleasures as if they were punishments contrive to have as much enjoyment of life as others who are envied for their manifest capacity to extract delight out of unpromising materials. Take, for example, a visit to some great building by an amateur and an architect, and contrast the difference between the effects it produces on them. To the amateur, assuming him to be instructed, the visit is like the realisation of a dream. The picture formed by his imagination is surpassed, and from the expressions of his gratification it may be concluded that his only regret is that ordinary buildings are not equally beautiful. Much of Mr. RUSKIN's criticism was inspired in that way. When PUGIN angrily exclaimed, "Why doesn't the fellow build something!" he was suggesting one of the reasons which make amateur criticism what it is. The architect can rarely permit himself to have such raptures. The building may have its rebukes for his own modest practice, it may offer hints which he is anxious to remember for future use, or it may compel him to enter into comparison between himself and the architect—most likely unknown—who designed the example before him. In any case the view becomes a subject for reflection, and if he should venture on remarks they are certain to be prosy if compared with those of the amateur. It is on that account so few descriptions of their journeys by architects are popular. They may be valuable to those who can sympathise with the writers, but the ordinary reader turns aside from them. For the public, FREEMAN, PETIT, RUSKIN, WALCOT, &c., have an interest which is never bestowed on architects. Yet if the truth could be ascertained, the dry essays of the architects may have been inspired by more real gladness than was possessed by the amateurs, but the sense of reality has had a sobering effect, and consequently buildings are not treated as if they were visions.

We have been led to offer these remarks from reading the volume in which Mr. BUMPUS describes his visits to several of the cathedrals and churches of France. We have records of summer holidays which are enough to make envious many tourists who come back bored after a trip on the Continent. The author was evidently in a mood to perceive much besides sermons in stones and good in everything that was found in the neighbourhood of a Gothic church. Prepossessed by the drawings of PROUT, WILD, PETIT, NESFIELD, PUGIN, DELAMOTTE and others, the French buildings appeared to him as cherished friends, and he was in the blissful state which is denied to architects, of being able to enjoy their presence as long as he pleased without any anxiety as to the extent to which they could be utilised. Happily for himself, Mr. BUMPUS was able to discover much else besides architecture to captivate his attention. He notices the musical services with the enthusiasm of an expert who is not confined to one style, and follows the order of church services with more than a mere layman's interest. His manifest contentment to remain in churches regardless of the worldly attractions which for the majority of weak mortals make French towns worth a visit is, we fear, not to be acquired by any reading, but in much else Mr. BUMPUS's example will, it is to be hoped, find many imitators. So much innocent, refined and healthy epicureanism which can be realised without much expense is exactly what many need in our time.

Among the places described in the volume are Dieppe, Caen, Bayeux, Coutances, Séez, Chartres, Le Mans, Tours, Bourges, Etampes, Sens, Joigny, Pontigny, Auxerre, Troyes, Châlons-sur-Marne, Chaumont, Langres, Dijon, Autun, Moulins-sur-Allier, Souigny, Nevers, Beauvais, Senlis, Noyon. They do not exhaust the "Glories of France," and we trust that Mr. BUMPUS will employ his holidays in

some of the remaining cities and towns which possess noble examples of architecture. He admires French work heartily but unlike some enthusiasts, he is not forgetful of the beautiful churches which are in England, and in his comparison of the work on both sides of the Channel he is impartial, as will be evident from the following passage:—

There are features in the great French churches to which those of our own land can lay no claim—their portals "scooped into the depth and darkness of Elijah's Horeb cave" and lined with sculptured effigies, but, it must be confessed, not always well proportioned to their façades; their chevets with graceful coronæ of chapels; their rose windows and their wealth of ancient painted glass—a wealth surprising when the fanaticism of the Huguenots, the vitiated taste of the Louis Quinze period and the fury of the Great Revolution are in turn reflected upon. Comparing the historic interest, architecturally, of the generality of the French cathedrals with that of our own, must be admitted that while ours are as a rule less valuable as monuments of one great church-building epoch, the re-edification, enlargement and embellishment of them extending over several centuries, whereas in France the majority of her great cathedrals were completed in all essentials ere the thirteenth century had more than half passed away—the blending of one style with another has always been so much more felicitously accomplished with us as to render an English cathedral the constant source of delight and that endless field for study and research to which, with all its grandioseness, a French one can hardly lay a similar claim. Indeed, in certain instances as in the façades of Paris and Sens, the combination of styles has been far from satisfactorily achieved.

As we have said, Mr. BUMPUS does not confine himself to architecture. He has much to say about ritual. At St. Etienne, Caen, he found that a procession round the entire church is still observed prior to one of the masses. As late as 1856 there were, it appears, no less than nine local "uses" in the united sees of Beauvais, Noyon and Senlis. But those relics of Gallicanism have almost disappeared. We hear much about the impressiveness of the cathedral of Chartres. According to the old saying, one ought to live in Rome like the Romans, and the meaning is no less applicable elsewhere. Mr. BUMPUS evidently acts in that way; for to understand a church thoroughly is a help to share in the services, and we suppose the more rigorous member of the English Church will not be shocked when he is told that Mr. BUMPUS joined in procession, for in that way he traversed parts of the building which might have otherwise been unnoticed. At Le Mans overpowered him still more than Chartres, for when relating his emotions on entering the building he says:—

Oh, for a mastery of vivid thought, for a wealth of pictorial words, that an adequate idea might be given of the greatness and magnificence of this wondrous choir, where the most enthusiastic admirer of the beautiful must pause in sole certainty of having reached perfection. How can I adequately make mention even in declaring its grandeur—a grandeur affording a striking contrast to the contemporary, but more rugged one of Chartres, to be unimaginable—of this choir of Le Mans? A marvellous sight to behold; it is, indeed, more like the preternatural shapes we gaze upon in dreams, embodying in its gigantic proportions the most expressive graceful motif, and withal the most minute and carefully finished details—than the sober realities emanating from skill and handicraft of living men. After having viewed those cathedrals entitled to a place in the first class—Amiens, Chartres, Paris, Rheims and Rouen—I may confidently affirm that I am at a loss to particularise any one the choir of which has, for beauty and solemnity, so indelibly impressed features on the memory as a *chef d'œuvre* in design and execution as that of Le Mans.

It is not often in these days we find a critic of architecture who is willing to acknowledge there is anything which he cannot discern a fault. We are, therefore, much pleased by the novelty as by the sincerity of his avowal. But the sanctuaries of Le Mans and other cities of France, it appears, cannot show altar hangings of needlework equal to those found in English churches. The church of Notre-Dame de la Couture is said to have a finer type of nave for congregational purposes than can easily be imagined. In the remarks on several of the churches, it is easy to see the position of a worshipper been assumed, and the planning becomes an important consideration.

At Tours Mr. BUMPUS found the daily capitular office performed with musical accompaniment and solemnity.

\* *Summer Holidays Among the Glories of France, her Cathedrals and Churches.* By T. Francis Bumpus. London: T. B. Bumpus.

He experienced that the cathedral grew in interest as he became more acquainted with it. He was struck by the peculiar arrangement of the choir, which made it necessary to have the well-known flying buttress carried out far beyond the general outline. Although a lover of Gothic, he has a good word for the new domical church, which has been erected near the site of St. Martin's Abbey. He compares it with the building on top of the hill of Montmartre, and considers it as a superb piece of work, and one which atones in some measure for the loss of the mediæval abbey. In describing the cathedral of Bourges he says:—

It is not often that one visits a world-famed church without disappointment. That of Bourges not only equalled, but much surpassed all previously conceived ideas of it, while its situation at the summit of gently rising streets, whose picturesque houses give scale to its immensity, with the light freely admitted on all sides, and with the archiepiscopal gardens extending the whole length of its south side, is one enjoyed by no other great French churches.

It is pointed out that in Bourges, as elsewhere, the most freedom is allowed to all who attend the services. Unfortunately English visitors are disposed to abuse the liberty, and their peculiar manner of acting as if they were feudal lords coming amongst superstitious serfs imposes a strain on French courtesy. In Sens Mr. BUMPUS found the Classical baldachino did not seem so out of place amidst Gothic surroundings as he had anticipated. But in a French church there is so much that is reminiscent of Rome, one incongruity more or less makes little difference. Habit causes each part to be considered independently, and the relation between them and the whole is generally disregarded. The abbey church at Pontigny, where THOMAS À BECKET obtained a refuge, is described "as a model for a town church, where, means being straightened, neither dignity nor good effect need be sacrificed where the work is entrusted to a master hand." One of the most interesting parts of the book relates to Auxerre, where the people seem to really appreciate the beautiful buildings bequeathed to them. Next Troyes with its fine cathedral is brought before us; then we are carried to Châlons-Marne, where the church of Notre-Dame was restored under the eye of M. CHAMPAÑOIS, the curé. An interview with him is recorded by the late G. E. STREET, and he stated at the time that the design by CLUTTON & BURGESS, which won the first premium in the Lille competition, was a copy of his church.

It is impossible to mention a page in Mr. BUMPUS'S book which is not interesting. He endeavoured to make himself at home in the towns he visited, and there is no trace of that superciliousness which is to be found in many narratives of travel in France. We do not know of any work in which ecclesiology, taking the word in a wide sense, is so genially treated. If it were less fruitful in information, the book would be useful to tourists for suggesting the spirit in which buildings should be visited by strangers. The pages are illustrated by a large number of reproductions of photographs showing the most important parts of the cathedrals or churches.

### THE HARDWICK TAPESTRY.

HARDWICK HALL is well known as one of the most interesting, as it is one of the most imposing, of the stately homes of England. It was built by the Countess of Crewsbury, renowned as Bess of Hardwick, whose sinister connection with the Queen of Scots and Arabella Stuart brings her into the main stream of English history.

The Long Gallery has always been famous, says the *Times*, for its tapestry hangings, and here a few years ago it was covered that, amid the mass of sixteenth-century work, there was a whole series of strips, isolated and to all appearance disconnected, of a much earlier date. Accordingly, the Duke of Devonshire had these taken down and sent to South Kensington, where they have been pieced together and restored with the zeal and efficiency that the officers of the Museum are accustomed to display in the service of the public.

It is now shown that they form a series of four, and the first piece, about 35 feet by 16 feet, restored to its original completeness, is exhibited for the present in the Tapestry Court, where it holds its own with the choice of the best periods.

The subject is a hunting scene, or rather a series of pictures of the chase. On the right is a bear hunt, in which a group

of strangers from the East are taking an active part. One, turbaned and barefooted, rides a camel, while several are using the *jarid*, a kind of dart shaped like a huge arrow, still common in Persia, and, as the Arabic name implies, originally made out of a palm branch stripped of its leaves. The same accuracy appears in the details of costume, and is difficult to account for, unless we suppose that the artist had access either to reality or to genuine Eastern pictures. In the centre of the composition there rises a castle, which, with moat and drawbridge, it has evidently puzzled the draughtsman to build. Some boys have been playing on the bank of the moat, and one of them has fallen in, and is being attacked by swans, while another tries from the bank to scare the angry birds with a stick. The left is taken up by an otter hunt. The animal is just being lifted out of the water on a three-pronged spear or trident. Behind the castle, boys rob a heron's nest in a tree, or present on their knees some specimens of the long-legged brood to a grave personage and his lady in gold chains and elaborate headdresses. In the distance we catch a glimpse of the sea, with ships, one of which flies the red cross of St. George. Finally, of the artist it cannot be said that, like Adonis, "hunting he loved, but love he laughed to scorn," for stately groups of knights and dames stroll up and down, and look on at the hurry and excitement of the scene in the intervals of their amiable converse.

We are accustomed to call tapestry of this kind Flemish, and for no better reason than that, as a rule, we are less certain of the early art of England in its true character and limits than of almost any other. But, in the first place, there is a robustness of type, a feeling of open-air freshness and vitality that contrast sharply with the tone of asceticism and seriousness that pervades the contemporary work of Brussels and Bruges. There is nothing to suggest that the artist is dependent for his images on some illustrated treatise of Veneri; on the contrary, it is more as if he were reproducing with the care and zeal of an enthusiast some of his own adventures *sub jove frigido*. Moreover, the very defects of the work stamp it as home-made. The Flemish craftsmen were further advanced in the art of perspective. They would not have appeared so helplessly at sea with the problem of setting the castle in something like a plausible relation to the landscape and the figures. The costume points to about the middle of the fifteenth century, and there is much both in the style and in the spirit of the piece that reminds one of English miniature art; while to Flemish work of this kind it stands, generally speaking, in the same relation as English to Flemish glass.

Unfortunately there are no documents to show how the tapestry came into the possession of the Cavendish family; but it seems clear that it belonged to the original furniture of Hardwick Hall. The countess was herself an expert and industrious needlewoman, and intolerant of idleness even in the Queen of Scots; but her taste lay in the direction of allegory and Bible history, as we can see in the minstrels' gallery at Hardwick, where there still hangs a panel representing the sacrifice of Isaac, with the countess herself looking on, starched and stiff, in her Elizabethan finery. This may explain, if it does not excuse, the scant respect with which she treated a mere hunting-scene with no strain of allegory or tendency to edification.

### BITS OF OLDER EDINBURGH.

MANY writers have from time to time endeavoured to explain the transformation which has taken place in Sir Walter Scott's "romantic town." Edinburgh was not unique in its subjection to the law of change, but somehow the difference between the present and the past is more marked there than in other cities. The latest contribution to the series of contrasts is the following interesting article by "J. S.," which appeared in the *Scotsman* of Monday last:—

Any one who has lived, moved and had his being in such a city as Edinburgh cannot without a mournful feeling reflect on certain of its once-cherished landmarks and long familiar aspects being for ever swept away. By "Older Edinburgh" is not meant the Edinburgh as it gleams through prehistoric mists, nor even as recorded in the legends of a long way less remote antiquity, but Edinburgh, say, of three-score years ago, or perhaps three-score and ten, and as it can still be easily remembered by that solitary myth, the oldest inhabitant. The city had, with all its drawbacks, a fine old-fashioned charm about it then, and for fifty or sixty years before that time was truly and in every way the capital of Scotland. At no period did she more worthily deserve the designation of the Modern Athens. She was then headquarters of the intellectual, and the powerful and the titled strength—the poetic genius and the forensic talent of the land. Alas! much of her glory has since that date departed. Even all her modern architectural polish and advancing commercial greatness have not made up for a non-resident nobility and an empty palace. That, however, *en passant*. At the time of which we

write there still remained some vanishing traces of what had been an earlier state of things, while there was much belonging to that period itself which was existing then, but now has disappeared. A few personal recollections applying to both these headings may, if not of much practical service, at least possess a certain amount of interest.

In general terms the city, old and new, may be said to have at that period or a little previously extended north and south from about Pitt Street toll bar—for tolls abounded then—to George Square, with a scattered prolongation out by Bristo to St. Leonards. East and west again it stretched from somewhere not much past the Calton Hill to a little way beyond the Lothian Road. Within that area many changes, and no doubt many of them improvements, were shortly to be brought about. Of these, perhaps no greater have at any time or in any part of Edinburgh occurred than those which within the period under notice have taken place in the locality now occupied by the new and extensive Waverley station. Not a great deal more than sixty years ago what is now the East Princes Street Gardens—and particularly the most eastern portion—remained a neglected spot and much in a state of nature. The west gardens again—once stigmatised as “the pest bed for all the city”—had by this time been laid out and were becoming quite a pleasure-ground for those who were the fortunate proprietors of keys. In the east this stage had not been reached, and in many ways the case was very different. Of course no railway, and consequently no Waverley Bridge, existed, but from about opposite the foot of South St. Andrews Street a straggling footpath as a short cut and a tolerable cart or carriage-way of somewhat greater length, and known as the Little Mound, extended across what was little better than an ordinary bleaching green to Market Street upon the other side. This street consisted of a rugged pile of ancient tenements extending eastwards to the arches of the North Bridge, the loftier houses of the High Street and the towering altitudes of the Royal Exchange forming an imposing background. Various archways, stairs, courts and narrow closes made their way through and among those tenements to the heights of the old town, somewhere near and opposite the Tron. Much mystery was attached to several of these wynds and darker corners in this quarter. Time-worn doors of what were held to have been plague cellars, and alleged to have been shut up ever since the last invasion of that scourge, were pointed out in some of their obscure recesses. Mary King’s Close, much of it by that time in a ruinous condition, had for long been superstitiously avoided in dark nights as the most specially haunted region in this neighbourhood, and the most gruesome legends of what had there been seen were still afloat. Mounting, tier after tier, among the mass of dwellings on this steep slope were situated “The Markets;” the high flesh-market, the low market, the middle market, the veal market, the poultry market, the tripe or clysteric market—all chronicled as being once upon a time established there; while the lower or ground floors of the houses facing Market Street were nearly all devoted to the sale of crockery or stoneware. Here also wending its way up alongside the markets was the famous Fleshmarket Close, whose primitive taverns could have told no end of tales about the high jinks and convivial ongoings of the wealth and fashion and sometimes even of the legal luminaries of a bygone day. On the opposite side of Market Street, and rather lower than the level of the roadway, stood a long one-storeyed building, with small iron-barred but open windows—the city shambles. Looking through these windows from the street, it was possible to see the slaughtering going on. An archway and descending steps opening through the middle of this building led to the green market, situated at the lowest level of this piece of ground, and just about where the chief railway booking offices now stand. It consisted of three sides of a square of open sheds fitted up for the sale of fruits and vegetables; the fourth side, next the North Bridge, was open and had been appropriated by the stalwart and comely fishwives of Newhaven as an impromptu market on their own account, by simply ranging themselves there, with their creels and general stock-in-trade in line from north to south. There were many curious stories told about the doings in this market, such as that of a well-known and eminent physician of the period being “slapped” with a raw “haddie” by an irate virago, roused at his too hard haggling for the fish. Between the green market and Princes Street—which stood at a much higher elevation—the space was occupied by the remains of Ann Street, part of which had been already taken down on the erection of the “new buildings” of the North Bridge—and by a row of houses called Canal Street. This street was so named on account of its being expected that the Union Canal would pass in front of the houses there, the first plans of the projected enterprise contemplating that the canal should have been continued through the Nor’ Loch valley, turning down to Greenside, where a basin or dock was to be constructed, from which the canal should join the Firth of Forth at Leith. From Canal Street a broad flight of steps led up once more to Princes Street, emerging almost

close beside the opening of the carriage-way and footpath already mentioned, and not far from the situation of the present railway stair. Bounding these steps on the east side was a rough stone wall, much used as an emporium for the sale of ballads, or “ballants” as they were often called—a species of literature now quite extinct. It took the form of songs printed upon separate slips of paper, each measuring about 10 inches by 5, the letterpress being only on one side. These were strung upon long stretches of twine nailed to the wall for the perusal and purchase of the passers-by. The songs were usually of a popular and “fetching” nature, often ornamented by somewhat sketchy woodcut as a heading, and cost a penny each. Sometimes on extraordinary occasions there were mingled with the songs readings of a more immediate fascinating and piquant character, such as “The last speech and dying words, just newly published,” of some delinquent who had that morning expiated his iniquities at the head of Liberty Wynd. Of both the “ballants” and the speeches, the contributor of these notes has on more than one occasion as a boy been extravagant enough to become a purchaser. Rising to a great height above Canal Street and its neighbourhood was the back of the then still standing new buildings now replaced by the new gigantic railway hotel. An inside stair, one of the new buildings led up to its successive floors, and opened upon the balcony of the old Rainbow Coffee-house from which there was an exit to the pavement of the bridge itself. Between the roadway to Canal Street and the bridge, on the line of Princes Street, there stood the only block of houses ever built on that side of Princes Street previous to the railway hotel now in course of erection there. These were occupied by the Turf Hotel, M’Queen’s Hotel and other establishments, among which were the old coach office where seats were booked for Leith, Seafeld, Portobello and some short stages of the kind. The Leith coach started from Smart’s or MacGregor’s office every half hour, and the coach for Seafeld from the Duty House at the corner of the bridge every hour from 10 A.M. to 9 P.M., the coach for Portobello leaving Croall’s and Turnbull’s offices at 2 P.M. Street every hour during the day throughout the summer season. Most of these conveyances carried two classes of passengers; they were, moreover, of remarkable construction, appearing as if the body of one of our modern broughams had been stuck upon the rear of a roomy family carriage. Other vehicles also started from these offices at hours to suit the sailings of the London steamboats, the *Royal William*, *Royal Adelaide*, the *James Watt*, the *Monarch*, &c., which had now for some time superseded the old Leith and London smacks. The fares for these coaches were high, and there was besides a toll and halfway house upon Leith Wynd and another toll, which was long afterwards continued, on the Portobello Road. Each of the hackney carriages of that time had two horses, and upon the one-horse ones being introduced they were at first known by the name of noddies.

All that has been as yet described was situated on the west side of the North Bridge. Immediately adjoining the east side again were the vestiges of the old Physic Gardens established here about 1670. These were removed to New Shrub Hill, on Leith Walk, about 100 years afterwards, and still later to their present site at Inverleith Row. There they now exist on a far more extensive scale, as the Botanical Gardens. All that remained of the old Physic Gardens so sixty years ago was little more than the mere name. The extent was never very great, but now was only indicated by a bit of waste ground reaching to the foot of Halkerston Wynd and Carrubber’s Close. This gave its name to the continuation of Market Street on passing under the arch that side of the bridge, as “The Physic Gardens.” To the north of what had been the gardens stood the old Orphan Hospital, the predecessor of the present handsome building near Bell’s Mills. This was a commodious and somewhat ecclesiastical-looking edifice of three storeys, surmounted by a slender pointed spire and ancient clock, once belonging to the Netherbow Port. In the immediate vicinity of the Orphan Hospital were Lady Glenorchy’s Chapel, founded in 1774 and seated for 2,000 persons with gratis sittings for the poor; venerable and historic Trinity College Church, founded in 1462 and taken down in 1845, the stones of which upon demolition were marked for reconstruction, and lay for 100 years upon the Regent Road waiting until that should be accomplished, stood next to this; and a little further south was associated with the charity of the Trinity Hospital, all of whose structures were removed during the successive operations of the North British Railway. Behind the Orphan Hospital upon its recreation grounds, where, 100 years before Whitefield used in his open-air conventicles to denounce the drama, there had long ago arisen Shakespeare Square and the old Theatre Royal, opened in 1769, all in their turn again to be removed for the erection of the new General Post Office in 1861, at which time, by the way, the uniform of the postmen was altered from the scarlet swallow-tailed coat and tall hat to the blue tunic and cap now worn by these officials.

Theatre Royal of Edinburgh came to be regarded as a great dramatic training school. By this time on its boards had figured all the great actors and actresses of the day. In addition to the higher class of tragedy and comedy, it had, by this time, produced dramatic versions of most of the Waverley novels; while operatic performances had by no means occupied a subordinate place in what it had supplied. "Il Barbiere," "La Gazza Ladra," "Masaniello," "Oberon," "Le Nozze de Figaro," "Il Turco in Italia," were found appearing in its bills. Its general company had comprised such names, within not many years, as T. P. Cooke, Mackay-Edmunds, W. H. Murray, Pritchard, Montague Stanley, Lloyd, Diddiear, Mrs. Siddons, Miss Noel, Miss Ellen Tree, the Misses Coveney, Miss Cleaver, Miss Nicol, Miss Fairbrother and many others, who added to the prestige of the Edinburgh stage. Opposite the theatre, a short way up Register Street, and in Gabriel's Road, was Ambrose's Tavern, at this time famous for the suppers of the Ettrick Shepherd, Christopher North, and the rest of the immortal coterie of the "Noctes Ambrosianae." Gabriel's Road was part of an ancient footpath used by the lairds of Inverleith on their way to St. Giles's Cathedral, and memorable for a woeful crime from which it got its name.

Shifting to another quarter of the town and extending into a somewhat later period, considerable changes have occurred and many great improvements have been made upon the Eastern Mound. The Mound—"Geordy Boyd's Mud Brig," constructed between 1780 and 1830—had now and for long before been established as a thoroughfare between the old and the new town. "Geordy Boyd," a clothier in the High Street, was said to have commenced it, by providing for himself a dry pathway across the bog to visit the more modern portion of the city. The Royal Institution, founded in 1823 and built upon 2,000 wooden piles, now graced its northern extremity, and in 1836 this edifice was further embellished by several rows of handsome columns being added, by a colossal statue of Her late Majesty being erected on the north portico, and by eight sphinxes being placed upon the four angles of the roof. South of this structure the Mound was to a great extent an empty space of unarrayed simplicity. No national gallery existed; a flat tableland of considerable expanse afforded accommodation for menageries and caravans and all sorts of shows and travelling entertainments. Among other purposes for which this open ground had been subservient was the then unwonted spectacle of a grand display of fireworks on the passing of the 1832 Reform Bill. The narrator of these memoranda, while as yet untrammelled by any political bias whatever, witnessed with delight and amazement its jubilant magnificence from a safe distance, at the head of St. David Street. Between the upper end of this waste ground again and the further portion of the Mound towards Ramsay Gardens a few small temporary shops, factories and unpretentious offices had been set up; while adjoining them, first one and latterly two enormous circular wooden buildings had been erected, called rotundas, and were fitted up as panoramas, Marshall's being the oldest and most popular. There on hundreds of square feet of canvas were exhibited pictorial representations of whatever was the last sensation of the day. Sometimes one or other of these rotundas supplied accommodation for a circus, when it paid a visit to the town, as in the days of Ducrow and Ryan, who had both occupied them in this way. At a later date, and in the same locality, a small theatre was erected known as the Victoria Temple and afterwards as the Victoria Theatre, Gourlay, one of the best Scottish comedians of the day, being the lessee. This place of entertainment was said to have at last slid down the bank behind it into Princes Street Garden. All these were soon after this removed to make way for improvements on the Mound, including the erection of the National Gallery, founded in 1850 and opened in 1859. On the completion of this building the present roadway of the Mound was planned and carried with the gentle curve it now describes round the south end of the Gallery towards Bank Street and the Lawnmarket. Previous to this merely a rough stone wall bounded the east and west sides, in a straight line from Princes Street to Mound Place and Ramsay Gardens. Only on the east side had there ever been any pavement for foot-passengers. Even this was by no means broad, and was always much encumbered with old bookstalls and the easy chairs of their proprietors—some of whom, if all tales be true, were not long in securing considerable wealth and high positions. The wall, too—like that of the stairs leading to Canal Street—was largely patronised as a favourite "pitch" for ballad mongers. All this was confined to the east side of the Mound; no one thought of traversing the west side, nor was there any access there to the adjoining gardens. For any of these alterations on the Mound, whether for better or worse, no railway was responsible. The railway had no doubt unnelled through its substance, but would have blushed to find this catch the eye.

It was very different with the Lothian Road. While the North British Railway had done the work of a magician in the

east, the Caledonian effected several transformations almost as striking in the west. Prior to that time the Lothian Road presented very much the appearance of a lonesome and suburban district. It was alleged to have been originally constructed in a single day, on the occasion of a wager by Sir John Clerk, of Penicuik, that this could be accomplished. Up to the incorporation of the Caledonian Railway Company, the whole stretch from Princes Street to Port Hopetoun was all but houseless. One or two isolated tenements rose at long intervals from the west side, and even these were at no distant date to be demolished. Kirkbrae House, opposite St. John's, the Riding School, the Military Academy and the Diorama were the more conspicuous, while somewhat back from the main thoroughfare were St. Cuthbert's workhouse and Laing's horse bazaar. Kirkbrae House, at the corner of St. Cuthbert's Lane—not very long before a hedge-row—stood till the new station was begun. So also did the notable brick edifice of Free St. George's, built there shortly after the disruption for Dr. Candlish's congregation. The riding school had been established in this locality upon Angelo Tremamendo's Royal Riding "Menage," as it was then called, situated in Nicolson Street, being pulled down to make room for the new Surgeons' Hall. The Royal Military Academy occupied a situation somewhat in front of the riding school. It had been successfully conducted under the superintendence of Captain Orr, who had carried the colours of the Black Watch at Waterloo, and had before its destruction supplied more than 1,000 officers to our army. The Diorama, famous for its artistic effects, stood further up the road, with St. Cuthbert's Workhouse some distance from it—a very different institution from its comparatively elegant and luxurious successor at Craighleith. All these structures were removed between the founding of the first station of the Caledonian Railway, half-way up towards Port Hopetoun and the building of the present one in Princes Street. The opposite side of the road had up to this time presented an equally desolate aspect with the other. Not long before, indeed, it had been principally occupied by barns and byres, and sheds and building yards, one of which had for some time given accommodation to the collection of stone figures long known as Forrest's statuary, which, along with what was designated as "Short's Observatory," had been removed from the Calton Hill. Leading from that side of the Lothian Road again, and winding round the base of the grandly precipitous Castle rock as far as the old West Bow, where it was to open upon the High Street, the new west approach had been begun in 1825, and with the formation of the "King's Road" and the "King's Bridge," completed in 1836. Beyond Port Hopetoun the immediate neighbourhood was much as it remains up to the present day.

Changes in other quarters, as well as changes in many of its ways, have, in Edinburgh within these three-score years and ten, kept pace with all the local metamorphoses which have been here described; changes, indeed, the mere outline of which, far less their description in detail, would require an amount of space which never could be looked for here. The ruthless hand of improvement has but small respect for the historical, the romantic or the picturesque. Even at the present day the most beautiful of all the streets of Europe, and the old rock fortress overlooking it, have suffered much at the hands of this physician. It is in such circumstances that memories of the past may always serve some purpose in recalling what things were before they vanished from our thoughts, and in restoring some that have become obliterated from our recollection. Time works wonders. What now seems trite and commonplace another century may robe with interest. Old memories, like old wines and old fiddles, improve by keeping. It does not, however, follow that to keep them long enough, they should be buried.

#### MANCHESTER SOCIETY OF ARCHITECTS.

THE fourth meeting of the winter session was held at 44 Mosley Street, on Thursday, January 9. Mr. A. Darbyshire, the president, took the chair, and Mr. J. D. Crace, hon. A.R.I.B.A., read a paper on "The Relation of Colour to Architecture." At the close of the paper Mr. Crace went round the room and pointed out the special points of interest in the numerous coloured drawings he had prepared of internal decorations. The paper which should have been read by Mr. Halsey Ricardo on "The Revival of Gothic Architecture" at the last meeting is postponed, as on the date arranged for the reading the train service between London and Manchester was upset by snowstorms. The monthly prize for a design for a shop was won by Mr. Claude Paterson. The November subject for a band stand was won by Mr. H. Solomon.

## NOTES AND COMMENTS.

THE gift of 200,000*l.* by Sir E. CASSEL for the erection of an open-air sanatorium will have the effect of inducing a great many people to give more attention to the new mode of treatment. If consumption is to be grappled with there must be sanatoria proportionate to the number of sufferers afflicted with the disease. The brochure by Dr. CHARLES REINHARDT, entitled "Life in an Open-air Sanatorium" (London: JOHN BALE, SONS & DANIELSSON), is therefore opportune. He was one of the earliest advocates of the system, and is at present physician-in-charge of the Hailey open-air sanatorium. It is not to be expected that architects, although they may have had experience in hospital construction, can understand the new requirements without study. Useful information has been given by Dr. REINHARDT. There are no mysteries about the new hospitals, and it would seem as if they cannot be too simple. Fresh air appears to be the most desirable element in accomplishing a cure, but it is well to be assured by an expert of the extent to which simplicity may be carried.

A CORRESPONDENT in Scotland writes to ask for information on the "method or rules for describing a plot or area of ground from its plan, or as to making a plan from a description where no plan is given." He encloses as an example a legal description relating to. "All and whole that plot of ground situated in Main Street, containing 33 square yards or thereby, bounded on the north-east in the first place by the centre line of Main Street 40 feet wide, along which it extends 35 feet or thereby; and, in the second place, by a steading of ground along which it extends 12 feet 11 inches or thereby, on the north-west by the said steading of ground, along which it extends, firstly, on the centre line of a mean gable wall and range thereof, 63 feet or thereby, and, secondly, 37 feet or thereby, &c." Our correspondent asks whether the description of which the above is a small sample can be considered as sufficient. If tested on the ground the measurements may be correct. It is not likely a Scottish judge would accept the description without some verification, and as long as things remain as they are on and about the plot of ground the phraseology is as clear as what is generally found in conveyances. But in all cases a description of property should be accompanied by a plan, for should the main street be altered, the main gable wall taken down and the adjoining properties change hands, words alone will be found inadequate to point out the exact limits of what was conveyed. Deeds relating to landed property which are not accompanied by plans are recognised by lawyers as an excellent source of revenue.

THE principal task of the French Academy is meant to be the preparation of a dictionary of the French language. Judging by the rate of progress at which the work is done, the globe will have cooled down and be unfit for human habitation before the end of the alphabet is reached. At the same time, the want of an authoritative dictionary is more apparent in England than in France. The judges in the Law Courts are our best interpreters. It was only on Tuesday that the Court of Appeal determined the meaning of the word "adjoining." A sub-lease of a house in High Street, Marylebone, was granted in which there was a covenant that the tenant would not do anything to "interfere with the quiet enjoyment of any adjoining or neighbouring premises," nor "object to any works to adjoining premises which may be sanctioned by or on behalf of the lessor or the superior landlords or landlord, nor claim any easement against the lessor or his superior landlord over any adjoining or neighbouring premises by reason of any act or thing done or suffered by any tenant of such adjoining or neighbouring premises." That was a common covenant in the leases of the Howard de Walden estate. A property company proposed to erect buildings which would cause an obstruction of light to the premises in question, and the lessee brought his action to restrain the company. The immediate lessor, who was interested in the company, endeavoured to stop the action on account of the above covenant. Mr. Justice JOYCE decided that the lessee was precluded from raising objection to any building works on adjoining premises which had

been sanctioned on behalf of the lessor or the superior landlord. An order was, therefore, made staying the proceedings. The plaintiff was, however, successful before the Court of Appeal. It was argued that the word "adjoining premises" extended not only to buildings which came in physical contact with the demised building but also to any buildings which were situated near enough to the demised building for works done on the premises to situate to affect materially the demised premises or obstructing easements enjoyed by the demised premises at the date of the demise. But their lordships declined to approve of any other meaning of "adjoining" than was expressed in the Metropolitan Building Act, 1894, where adjoining owner and adjoining occupier relate to land, buildings, storeys or rooms which are in physical contact with a building owner's property. Adjoining is not, therefore, equivalent to neighbouring, and a knowledge of this fact may sometimes prevent litigation.

AMERICAN inventiveness is applied to the saving of labour on a small as well as on a colossal scale. One of the latest efforts is for quickly producing titles on plans. Fifty or sixty years ago the titles on surveys of estates were often splendid specimens of calligraphy. It was not merely the lettering that was attractive, but vignettes were sometimes introduced as part of the composition. The work was, however, slowly accomplished, and it was not uncommon to spend a month over a title of a valuable property. Afterwards a cheap class of lettering was employed. The stencilling was adopted at least for parts of titles, and engraved letters were manufactured and sold as substitutes for the laboriously formed efforts of the draughtsman. In the United States a small hand press has come into vogue with a special ink that dries quickly. In railway offices where titles used to cost on an average about 10*s.* each the printed titles by the new method can be got out for about a tenth of that price. In a little time we may therefore expect that lettering on plans by hand work will have gone the way of many other lost arts.

## ILLUSTRATIONS.

CATHEDRAL SERIES.—RIPON: THE CHOIR TO EAST WINDOW.

THE DAVID LEWIS HOSPITAL, LIVERPOOL.

ST. MARY'S CHURCH, ECCLESTON, FROM EAST END OF SOUTH AISLE, LOOKING INTO CHANCEL.

THIS church was built by the late Duke of Westminster as the parish church of Eccleston, near Chester. It is entirely formed of the beautiful red stone of the neighbourhood, being of ashlar inside and out. It is made complete, as few churches are, with carved fittings, and all the windows filled with excellent stained glass. The floor is laid entirely with marble, and an organ is happily placed, high up over the tower-arch.

In the view a canopy of stained and gilded oak is shown. Under this there is now placed an altar monument with an effigy of the late Duke, well carved in alabaster, and which was not there when the view was taken. Though the actual dimensions of the building are not large, yet it has much of the effect of a small altar church, vaulted, as it is, throughout in stone. The floor is of marble, and has a high carved oak canopy with figures. The western tower rises well above the clerestory and has double belfry windows. In style it is strictly English of the fourteenth-century manner, but is original in its composition and design.

The architect was Mr. G. F. BODLEY, A.R.A., of Grosvenor Inn. The work was well carried out by Mr. FRANK DEDDINGTON.

COTTAGE HOMES, DRYMEN, N.B.

THE illustrations we give this week of the Convalescent Homes for Girls have been erected by Mr. WILLIAM EWING GILMOUR, in memory of his daughter, for the purpose of employing by Messrs. JOHN ORR-EWING & CO. Mr. CAMPBELL, of Glasgow, was the architect.

THE TOWER OF ST. LAURENT AND THE CHÂTELET.

### THE CHÂTEAU DE VITRÉ.

THE town of Vitré, which is about nine miles from Laval, is constructed upon a hill, at the foot of which is a valley through which the river Vilaine runs. The château is erected on a point of the hill. The town was defended on the north by a wall laid out almost in a straight line, and on the south side by another strong wall which was carried to the foot of the hill. Vitré was so well enclosed that entrance was only obtainable through three gateways and a postern. The three gateways have been destroyed, and the postern is only to be judged in a restored state. Towards the end of the fifteenth century several small towers were constructed as well as bastions in order to cope with the new means of attack. In consequence of those changes the ancient appearance of Vitré is hard to realise. However, a great many of its houses preserve their Mediæval character.

The most important building was the château. It could only be approached through a number of dependencies which formed the first line of defence. Then a court was crossed obliquely in order to reach a bridge that was placed across the ditch. At each of the three angles of the château was placed a tower. The principal tower was named after St. Laurent. It dominated the gate of the city, and commanded the route to Rennes. In other parts there were also several towers, and the building must have been thought an invaluable source of defence. The interior court was irregular in plan. On one side were the kitchen, the bakery, a square tower called after Cæsar, besides cellars and storehouses. On the first floor were the habitations of the owners. But the arrangement is only conjectural, for the whole of the ancient interior arrangements were destroyed in order that the château might be converted into a prison for the department of Ille-et-Vilaine.

Vitré was an appanage of the Comte de Rennes. About

A.D. 990 it was made over to Martin, the son of Tuhæel Beranger, who was the founder of the Barony of Vitré. In 1239 it passed, by marriage, to the house of Montmorency Laval, in 1412 to the house of Laval Montford, and in 1605 to the family of Tremoille. As far as can be made out, the first château of Vitré did not stand on the site of the existing remains. In 1222 it is recorded that prisoners were confined in the building. Exactly two centuries later there is an account of reparations of the château, and in 1582 the Parliament of Brittany used it as a refuge to escape from an epidemic. In the sixteenth century, during the disturbances which arose out of religious differences, the building was repeatedly attacked. In 1590 it was on the point of being surrendered, but was preserved by the bravery of the captain, whose name was Rallon. Two years afterwards it was again attacked, but as it was protected by 1,200 men it was believed invincible. At the time of the Revolution it was declared to be national property, and was utilised first as a prison and then as a barrack. After the fall of Napoleon it was restored to the Tremoille family, who in 1820 made it over to the Department. In order to convert it into a prison it was, as we have said, in a large measure destroyed. It is supposed that the tower of St. Laurent was erected on remains dating from the eleventh century, while the tower itself dates from the thirteenth century. The central part of the châtelet is thought to have been erected in the fifteenth century.

The château must have been of immense size. During several years the ruins were used as a quarry. Vitré possessed invaluable archives, but as the chamber in which they were placed was undefended, the boys of the town gained admission to it and carried off the documents in large bundles. Only a few of the parchments were preserved, and they were deposited in Rennes. But they have also been lost sight of, and it was with difficulty the history of the buildings has been traced.

## AN AMERICAN DRAUGHTSMAN'S OFFICE.\*

**A**FTER completing the course of studies in engineering there is really only one thing lacking to start the young engineer toward success. That one thing is opportunity. Many a successful engineer can trace his success to the right opening that gave him a chance to start. The young engineer is being sought after more each year and the opportunities to get started are on the increase.

A large number of these opportunities present themselves each year in the draughting-rooms of bridge and structural steelworks. When a young engineer secures one of these positions he must show a disposition to learn, work hard, and be willing to do anything. Willingness to take hold of anything will be a large factor to rapid advancement. Too much stress cannot be laid upon the theoretical side of the engineering course. Well-grounded theory is the foundation to practical success.

The design and building of a steel structure may be compared to that of a frame building in which all the nails would be located and holes made for them before putting the boards together, all the pieces of lumber would be laid out and sawed to fit before being put in place, the difference being that if the parts of the steelwork do not fit when put together it is not as easy to recut and shape them as it is with the lumber. If the pieces of steel do not fit when put together they are often spoiled, and must be thrown away. It is often difficult to get the pieces of material to replace the rejected parts. The material for a bridge is ordered from the rolling mills to shape, size and length required, assuming that nothing will be spoiled, just the same as lumber for a house is ordered from the lumber yards. The rolling mills are often hundreds of miles from the bridge shops, while lumber yards are usually in the community in which the house is being built.

The comparison above will serve to illustrate the truth that one of the most important requirements of the draughting-room is accuracy. The most careful and painstaking man will make mistakes, but the more nearly a person's work is free from mistakes the more it will be appreciated. Accuracy should always have the preference over rapidity. Rapidity or hurried work is almost always accompanied by a large number of mistakes or a slackness of the work in one place or another. Work rushed through an office without proper care and attention is almost always accompanied by a greater loss of time in correcting mistakes in drawings while passing through the shop than is saved in the first place, besides the expense of correcting errors that may not be found till the work is erected. The drawings and work of this kind are unsatisfactory, and should be avoided as far as possible.

The engineering force of a bridge company is usually divided into two departments, the estimating and the detailing.

The work of the estimating department is to prepare the estimates of weight and cost of all work that the company bids upon, prepare all stress sheets and preliminary plans when required, and they must secure all data and information necessary in preparing the detail plans. Sometimes the plans for making estimates are furnished by the parties wanting the work. Then it is only necessary to figure the weight and estimate the cost. If no plans are furnished, the stress sheets and preliminary plans must be worked up from the data furnished. When plans are furnished they are usually prepared by an engineer in the employ of the party wanting the work or by a consulting engineer who has charge of the work. The work is contracted for in one of two ways—so much per pound of shipping weight or so much for the work complete. The one is called a pound price and the other a lump sum; sometimes erected complete ready for traffic and sometimes f.o.b. (free on board) cars at a certain place, the party buying the material doing his own erecting.

The work of the detailing department, or what we shall hereafter designate as a draughting department, is to take the data furnished by the estimating department and make the detail shop plans. The work usually requires from three to five times the number of men as the estimating. It seldom occurs that a set of drawings comes into the office that can be sent into the shop without being made over, even though they are carefully worked out in detail; or that a set of plans made for one bridge can be used again, even though it should be of the same length and width. Especially is this true of railroad work, since the conditions vary so from year to year. Specifications for material and loading are changing constantly. Ten years ago a 100-ton engine was considered a heavy engine; to-day, 150-ton engines are common in specifications. Cases where plans were used again in this way have happened only a few times in the ten years' experience of the writer.

A shop that turns out 6,000 to 8,000 tons of work per year requires a draughting force of about eight, distributed about as follows:—The chief draughtsman, two men of experience who

can handle any kind of work, one or both being classed as checkers, three men to detail the bulk of the work and sometimes doing their own tracing, two men to do tracing and who will work into detailing. This makes a draughting force of eight scaling up in experience. Three years' experience in the draughting-room should make an engineer familiar with the ordinary work that comes up.

We will now take a bridge from the beginning and trace through the different steps until it is finished and turned over as completed to the parties buying it. We will assume that a railroad company desires to contract for a bridge. The chief engineer will write to the several bridge companies from which he desires to receive bids, giving the length of span, location, specifications for loading and material, and any other conditions that may govern this particular bridge, and the date of receiving bids. The estimating department takes the data given, prepares the stress-sheet, figures the weight of the bridge and makes an estimate of cost. The bids are received by the railroad company, and we will suppose that the bridge company we are considering receives the award of the contract. It is usually presumed that the lowest bidder gets the contract, although the time of delivery and other conditions may alter this. In the letting of public work where the plans and specifications are definite, the lowest responsible bidder gets the contract.

After the contract is secured all the data required to get out the details of the work are turned over to the chief of the draughting-room. This data will include the stress sheet, specifications and a data sheet, properly filled out, containing a list of items that usually come up in working out the detail. An order for material must first be made, and this may require sketches of such details as are not determined by the data furnished, as every piece of material ordered must have its place in the bridge and every piece required must be ordered.

This material is usually inspected at the rolling mills by some one employed by the railroad company, and must meet the requirements of the specifications. This order for material is turned over to the person whose business it is to place the orders with the rolling mills, and furnish the inspector with a copy of the same. It is a good plan to check the weight of the material ordered with the estimated weight of the bridge.

After the material is ordered the work may be laid aside until a convenient time comes to work up the details, unless the necessities of the case require immediate attention. The data is then all turned over to one or more men, as the case may require, to make the detail drawings. The chief draughtsman should go over the data with the draughtsmen, making such explanation as is necessary, and outline the manner in which the drawings are to be made. Time is saved by planning each sheet and each set of drawings before beginning the pencilling. The drawings are then pencilled and traced. On an average, from two to three days are required to pencil one drawing, and less time is required to trace a drawing than to pencil it. If drawings are to be sent for approval they are usually sent as soon as the tracings are finished and looked over, but before checking, in order to save time. This assumes that the general details, sizes and dimensions are correct, and that errors which affect the shop work alone do not concern the parties getting the bridge, and that these errors will be corrected in checking.

The tracings and all information are now given to the checker, who is supposed to check every figure on the drawings and indicate what may be lacking on the drawings to make them complete and conform to the requirements of the specification. It is a good plan to put a dot of red ink under each figure as it is checked, using waterproof ink so it will not run if the tracings get damp, as they generally do when filed in a vault. All corrections should be made with a blue pencil so as to be seen easily. The tracings are then returned to the man who detailed the pencil drawings to be corrected. All corrections should be checked by the detailer to be sure that the corrections are correct. After corrections are all made the drawings, with the blue pencil marks still on them, are given back to the checker, who looks the drawings over to see that all corrections have been properly made.

One of the duties of the draughting-room is to make out the shipping bill by which the material is shipped when the work is finished in the shop. Every piece of finished material of the different kinds has a line in the shipping bill, that it may be checked off and the weight placed opposite as it is shipped.

From twelve to fifteen sets of blue-prints are made of each set of drawings, distributed about as follows:—Six to the shop, one to the inspector, two for approval, three for file to the parties buying the bridge, and others as occasion may require.

The first work in the shop is to make the templates. Almost every different piece of material is first laid out on boards, the holes bored in their proper places, each piece marked, giving the number required, and any other necessary information. These pieces of boards are called templates, and are used for laying out the work on the pieces of steel by clamping or holding the templates on the pieces of steel. There are from one to eight pieces of each kind for one span.

\* A paper by Mr. R. G. Manning read before the University of Michigan Engineering Society.

of a bridge, and the templates are used on each piece, making one template serve to lay out as many pieces as there are of that kind. One template often serves for more than one kind where they differ only slightly by properly marking the template. Where rivet spacing is symmetrical about a centre line only, one-half of the length of the piece need be laid out on the template. Some of the large plates are often laid out on one of the plates itself, punched and then used as a template, as it would be too expensive to provide the lumber on which to lay it out.

The work then goes through the process of shearing, punching or drilling, assembling, reaming if required, rivetting, milling, boring, inspection, painting, shipping and erection. A draughtsman should visit the shop frequently to see how the work is done and acquaint himself as much as possible with the practical side of the work.

All the work of the draughting-room should be checked by some one other than the person who made the original. This cannot always be done, but should be carried out as far as possible. The work of this department is final and is so important that every precaution possible should be taken to eliminate the errors. It usually results in a saving of time to have the work thoroughly checked, as all mistakes will be discovered before the work has passed through the shop and is erected, and it takes a great deal more time to look up mistakes and correct them after the work is laid aside than it does to do it in the regular way while the work is fresh in the mind. When it is remembered that there are hundreds of figures and relations of parts on every drawing, and that they pass through the steps of preliminary computations, transferring to the pencil drawing, and tracing, with so many chances of misconception, it is very important to have the final work thoroughly checked.

The tools necessary for a draughtsman in a bridge office to have are two 45-degree triangles, 4-inch and 10-inch; two 30-degree and 60-degree triangles, 5-inch and 13-inch; two good right-line pens; one good 42-inch T-square, one that is stiff and not too light; one compass complete, one bow pen, one bow pencil, one engineer's and one architect's scale, pencil and ink erasers, scratcher, and piece of soap-stone to rub over a place in the tracing cloth that has been scratched, to renew the surface and prevent the ink from running. Transparent triangles and scales with celluloid faces are best.

A few of the practical wrinkles of the draughting-room will be found in the following:—

All blue and black pencil marks are removed from the tracing with benzine. Dampen a cloth with it and apply to the tracing. Lay the tracing on a newspaper, or some paper that is not wanted, before applying the benzine, as it passes through the tracing and will spoil a pencil drawing. Plenty of linen cloth is usually obtainable about the draughting-room by washing out the tracing cloth.

An ink to make white lines on blue-prints is obtainable by dissolving soda, lime or saleratus in water, or an ink can be obtained of dealers in draughtsmen's supplies. Any of these inks will run and blot the lines if the print becomes damp.

It is the practice in some offices to pencil the work on the tracing cloth and ink it in. In others the pencilling is done on paper and traced. The writer prefers the latter.

Tracing should be done on the rough side of the cloth, as it is easier to mark on that side in making corrections, changes, or additions. Tracing cloth has a tendency to roll up toward the glazed side, and when the border is put on the drawing on the rough side it will correct this tendency to roll; whereas, if it is put on the glazed side, it will tend to increase it.

There should be one size of sheet for detail work, and under no circumstances should this vary, as it is unnecessary and always proves a nuisance. Where the drawing cannot be made on one sheet it can be made on two or more, and so arranged that the sheets may be pasted together after printing; 23 by 35 inches for border lines and 24 by 36 inches over all is a convenient size.

Prepared ink is preferable to the stick ink, which must be ground, as it is more uniform, cheaper and cleaner.

Tracing cloth powder, which can be obtained of the dealer in small cans ready for use, is better and causes less trouble than powdered chalk.

The natural place for the title of a shop drawing is the lower right-hand corner, the top of the title being about  $3\frac{1}{2}$  inches above the border line. If a stamp is used for all of the title except that which describes the work on the sheet, the titles will be more uniform, and will add considerably to the appearance of the drawings. The title should be made plain and prominent for ready reference in the files. It should contain the contract number, sheet number, general title of the work, the special work on that sheet, scale, date, name of detailer, tracer and checker, and name of bridge company. In the lower right-hand corner a circle  $\frac{3}{4}$ -inch in diameter, with a horizontal line through the centre, having the number of the sheet above the line and the total number of sheets in the set below the line, makes a convenient means of reference.

The writer prefers to file the tracing flat in a drawer, one drawer containing as many tracings as is convenient.

The best way to stretch tracing-cloth on a drawing-board is by means of small one-half ounce tacks. The tacks are driven into and removed from the board by means of a special hammer made of  $\frac{1}{2}$ -inch round steel and tempered. One end is turned over at right angles to the length so that the end is three-quarters of an inch from the inner face, and the other end is straight and sharpened like a chisel. One end is used for driving and the other for removing the tacks. The whole is about  $6\frac{1}{2}$  inches long. The hammer is magnetised at a dynamo and will pick up the tacks so that they do not need to be handled with the fingers. Place the tracing-cloth on the board and empty a box of tacks on the tracing and tack the centre of the four sides with two tacks each, stretching the tracing tight. Then stretch the tracing by working from the centre of the sides to the corners, placing a tack every 2 or 3 inches. The tacks that are left loose on the tracing are taken up with the hammer and dropped back into the box. This gives a perfectly smooth surface to work upon, and the tacks do not interfere with the sliding of the T-square. The tacks are removed with the chisel end of the hammer, taking up one tack after another, the tacks all clinging to the hammer and then dumped into the box. The tracing is put down and taken up very quickly this way, and a thumb tack has not been used in our office for seven years.

There should be a uniform style of lettering for all shop drawings—one that is plain and easy to read. The Reinhardt slant letter is a very good one for this purpose.

Full, light black lines are used for dimension lines. There is enough contrast between the light dimension lines and the heavy lines representing the object drawn not to confuse the drawing. The full, black lines are put on the drawing more rapidly than either dotted or red-ink lines.

## THE DESIGNING OF CITIES.\*

FROM whatever point of view the question be studied, whether from that of convenience or that of artistic effect, one is compelled to admit the overwhelming merits of the adoption as the foundation element of any design of what may be called radial centres; that is, centres from which shall diverge in all directions the streets that are to constitute the main arteries of traffic or leading streets of the city. Just as a town or city has its lines of intercommunication with neighbouring aggregations of settlement, branching out in all directions, so should these radial centres be in direct communication with one another and with every part of the city. This is evidently the arrangement to which there would be what may be called a natural tendency to conform. The greatest area is reached with the least length of street, and the greatest distance to be traversed in passing from any one point to another, as compared with the direct distance between the points, is approximately a minimum when the angles between the diverging streets are about 60 degrees, that is when the radial system is hexagonal. This may, therefore, be taken as a guide in analysing the topography of a site in order to establish the first important element of the design, viz. the positions of these centres and main lines of traffic. The rectangular system of streets, so much in vogue in the States of our Commonwealth, is absolutely inconsistent not only with what may be called the natural arrangement, but also with the position of maximum efficiency; for the best system from the point of convenience is that which, without greatly increasing the aggregate of street length, enables the traveller to reach any desired point without having to pass over a distance seriously greater than its direct distance, and this requirement is obviously satisfied by the radial system only. The rectangular system has the further disadvantage of not admitting of architectural monuments, or other great central features, being brought into striking prominence from so many points of view; it is therefore, compared with the radial system, no less defective when judged aesthetically.

It would be a mistake to infer from its geometric merits that the hexagonal was the only proper form of the radial system. We may often need a greater number of converging streets than six from one point. At the Arc de Triomphe in Paris there are no less than fourteen converging avenues, at the Place de la Bastille ten, at the Place de la Nation nine. At the Capitol in Washington there are eleven long converging streets, and eight and ten in other places in the same city. At Karlsruhe, in Germany, there are no less than eleven radial streets about 120 degrees of arc, their directions all converging upon the Castle, Library and Cabinet of Natural History.

\* A paper by Mr. G. H. Knibbs, F.R.A.S., read before a joint meeting of the Institute of Architects and the Institution of Surveyors, New South Wales, and published in the *Building, Engineering and Mining Journal*.

*Position of Radial Centres.*

Radial centres may be described as points about which particular types of civic activity will tend to concentrate: they may be the foci of political, administrative, commercial or manufacturing energies, or of intellectual or æsthetic interest. Hence they must be on leading lines of communication, on the broadways of traffic, and consequently, also, the most careful regard must be paid in their selection, not only to the limitations imposed by the topographical features of the site, but also to those imposed by the positions of outlying centres and existing or potential roads and railways thereto. Similarly, strenuous care must be exercised as to their efficiency in times of peace and in times of war. Economy of effort in reaching industrial or other ends requires that activities having many points of contact, or frequent need of intercommunication, shall be so grouped as to reduce intercommunication itself to a minimum, and thus it happens that, in order to properly design a city, it becomes necessary in focussing its various energies to have throughout regard to convenience, efficiency and artistic effect. Nothing short of an exact appreciation of the topographical adaptability of the site, and of the interdependence and mutual influence of different forms of civic activity, is sufficient for so localising the occupation of the city that its political, administrative, military and various other features, previously specified, shall be the best possible from every point of view.

Digressing for a moment from the general question, it may be said that, in mentioning the necessity for attention to our military needs, it may be remarked that this is a matter we are likely to treat too lightly. It has been, so far, our good fortune in this land never to have heard the horrid clamour of Bellona; nevertheless the experience of mankind (*e.g.* Paris in the last Franco-German war) shows how important the military provision is, and how bitterly we may rue inattention thereto. Hence, however much it may be disregarded so far as immediate necessities are concerned, ample provision for facilitating the mobilisation and despatch of troops, war material, &c., and for the defence of the city, must be made in the design, in recognition of the inevitable contingencies of at least the more remote future.

Among the several radial centres or focal points to be provided in the design, that at which Parliament will be housed—and round which the great departments of public administration therefore be concentrated as a matter of convenience—will necessarily receive first attention as the grandest centre. For the accommodation of judiciary, commercial and industrial institutions, of a university and its affiliated colleges, of technical and high schools, of barracks, armouries and other provisions for the rapid mobilisation of troops, and also for sites for great public monuments and monumental buildings, other centres must be located in such a manner as best meets the practical needs of city life, and at the same time enhances the appearance of the city.

*Other Systems of Streets.*

As has already been stated, the radial system is unequivocally advantageous from every point of view. Reverting to the question of the best angle between the radial lines, it may be remarked that in a square divided by two diameters into four equal squares, and in a circle of equal area divided into six equal sections by three diameters, the total perimeter length in the latter case is only about 15½ per cent. greater than in the former, while the mean perimeter distance from all points to the centre is 14 per cent. less; that is, supposing the perimeter lines to represent streets, then the reduction of average distance to the centre is practically equal to the increase of street length necessary to obtain it. A little reflection will show that the hexagonal radial system is, as previously stated, the best from this point of view, and involves the introduction of ring streets round the centre, something like those at Karlsruhe in Germany, or those in one quarter of New Orleans in America, *e.g.* St. Charles Avenue. If, however, for the ring streets straight ones are substituted, the iteration of the hexagonal system leads to a division of the entire area into a series of triangles approximately equilateral in form. This scheme possesses the marked advantage of making the greatest distance of travel from any one point to any other never more than 15·47 per cent. greater than the direct distance between the two, while in the rectangular system of streets the distance may be as much as 41·42 per cent. greater. (Hence the ratio of advantage is 115·47:141·42=100:122·47.) While showing that the rectangular system pure and simple ought never to be accepted, this fact does not show that that system may not be beneficially combined with the hexagonal or any other form of the radial system. In travelling about a city set out on the rectangular system there is a distinctly better sense of orientation than where its streets are irregular, and it has always been felt that from the point of view of building construction it has much to commend it. Ancient Antioch, with its magnificent "golden" street, about four miles in length and 200 feet in width, was substantially rectangular

in design, and so also are the majority of cities. It is almost self-evident that a combination of the two systems practically secures the advantages of each, and this is the merit of L'Enfant's design for the capital city of the United States of America. (See fig. 1.)

A radial rectangular system like that of Washington is possible, however, only where the ground is sensibly level, and to attempt to apply it in its integrity to any site without regard to the topographical features of the latter would be to wholly misconceive the problem of design. Cities cannot be designed on a general pattern. Configuration of surface not only necessitates the setting out of streets in such position as will give the best gradients; it also modifies the design in respect of the localisation of its centres, and in respect of its general scheme from the standpoints of æsthetics and hygiene, a matter to which we shall later refer at greater length.

We may say at once, therefore, that the radial system, either with or without its cross or connecting streets in polygonal or

FIG. 1.

spider's web form, or in ring form, and the rectangular system may be combined in any way whatsoever suggested by the conformation of the ground, or by the necessities of localising the centres with respect to convenience or artistic effect. And similarly curved streets, or even streets of zigzag form, may properly be introduced, or rather should be introduced, wherever the resulting gradients show them to be advantageous. Not only may curved streets be employed where they are practically necessitated; they may even be introduced where traffic is only moderate in quantity, for the relief of an unartistic uniformity, provided that the element of gradient is thereby improved.

*Cardinal Direction of Rectangular Streets.*

In the temperate zones the sun's direction for six months of the year is never south of an east-and-west line, a fact showing that the north-and-south and east-and-west directions for the streets in a rectangular system is an error. Where topographical features do not interfere, the directions making angles of 45 degs. with the principal cardinal points are evidently the best so far as the theory of solar light is concerned. Ottawa and Montreal are laid out conformably to this idea.

In latitude 35 degs. south—the nearest fifth degree to the latitude of Sydney—the following proportions obtain between the meridian shadows at the summer solstice, the equinoxes, and the winter solstice, viz. the length of the sun's shadow at noon is respectively  $\frac{1}{5}$ ,  $\frac{7}{10}$  and  $\frac{3}{4}$  of the height of the supposed vertical object casting the shadow on a horizontal plane. The sun is east or west at the following intervals of time before or after apparent noon on the several dates mentioned, viz. :—

Dec. 22.	Jan. 19,	Feb. 19,	Nov. 21,
	Nov. 24.	Oct. 24.	Sept. 23.
h. m.	h. m.	h. m.	h. m.
3 30	3 50	4 50	6 0

The north-east and north-west faces have at all times eight hours of continuous direct sunlight; the south-east and south-west faces from 6½ to 1½ hours, or a mean of four hours, the duration of direct sunlight thereon at the equinoxes. The adoption of directions making angles of 45 degs. with the true north-and-south and east-and-west lines will often be greatly modified by the surface configuration. The theory of the best position is to be taken as a guide, not as an inflexible rule admitting of no variation.

*Width, Grade, Cross-section and Location of Streets.*

In dealing with the characteristics of streets in a capital city, the first principle that may be laid down is that the æsthetic requirements may be regarded as of commanding importance, and should therefore be given prominence in the

general idea, while utilitarian considerations should be subordinated to the last possible degree consistent with the fact that the general arrangements must be really practicable. Although there is no inveterate opposition between artistic effect and convenience, there must to some extent be a sacrifice of one to the other. Thus in respect of the element of width, economy of construction and maintenance, and mere convenience in the conduct of business would suggest the narrowest width of street that would avoid intense congestion of vehicular and pedestrian traffic, while from the sanitary and æsthetic points of view wide streets are preferable, since they are less dangerous and are both healthier and more beautiful.

Dealing with actual dimensions, and commencing at the lower limit, it may be affirmed that lanes of less than 10 metres width are very undesirable. Unimportant streets, so situated that they can never become of importance, might be designed with widths of from 20 to 25 metres. Streets of moderate importance likely to require tramways, cycle paths, central walks and so on would be satisfied by a width of from 30 to 40 metres; while still wider streets, set out with avenues of trees, flower-beds, &c., might be of any width from 50 to 75 metres. For the purpose of comparison it might be mentioned that the streets of Washington are from about 24 to 36 metres, and the avenues about 36 to 49 metres. The usual cross section of roadway with raised footpaths should hold good for the narrowest streets only. In those of medium width a row of fine foliage trees on each side next to the footwalk would constitute the usual feature. In streets where there is little traffic, as, for example, those in the residential quarters of the city, strips forming garden or grass plots, graced with shrubs of various kinds, might well form a feature. To obtain variety a somewhat wider street could have a centre-line or lines of ornamental trees with or without footwalks, or a cycle path, &c. The widest streets would allow of sidewalks, bounded by rows of trees or strips of garden, and a triple central avenue of fine proportions with double footwalks, and still leave ample room for two roads for tramway or vehicular traffic. Cycle and motor paths—already referred to—would always be so located as to involve a minimum of interference with other forms of locomotion.

Touching the question of the limits of street gradient, it may be observed that it must necessarily be sufficient to carry off surface drainage; its lowest limit would therefore be  $\frac{1}{2}$  per cent. For vehicular traffic no severer grade than 10 per cent. should be allowed, and it is hardly necessary to say that of alternative possible designs, that which, other things being equal, secures the lightest grades throughout, especially in the streets which carry the heaviest and greatest amount of traffic, is the better.

The interdependence of topographical features, types of occupation and character of street in a city intended to be ideally healthy and beautiful requires that the study of the design should be exhaustive. Every possible variation should be systematically analysed by a comparative method, for it is only in this way that the best result can be achieved.

The following are the main principles of location. For leading lines of heavy traffic light grades are required, and widths proportionate to its ultimate magnitude. Special regard must be paid to adequate provision for all future contingencies at such points of congestion as depôts and freight yards of all kinds, railway stations and similar places. As before said, provision necessary for the mobilisation and despatch of troops, war material, &c., must also be borne in mind, whatever opinion obtain as to the needlessness of this in the near future.

With respect to residential streets, gradient is of less importance, it being merely necessary that the general character of the street should harmonise with the class of residences adjoining. Where they are to be palatial, the streets should possess a collateral magnificence, while the streets in localities populated by the poorer classes must, of course, be less pretentious in design, though they, too, may well be made picturesque with foliage trees.

#### Engineering Features of Streets.

The necessity for some official control of the localisation of the different classes of occupation, which a regard for the general appearance and welfare of a capital city not only justifies but imperatively demands, permits its development to proceed on lines that obviate frequent changes in the constructional features of the streets, for these can all be thoroughly considered at the outset. The mains, conduits, tunnels, &c., required for water, gas, electric or various forms of power-supply, for sewerage systems, for telephone and telegraphic services or for underground communication of any sort can be located so as to involve the minimum disturbance of traffic and the least expense for maintenance and repair, and the characteristic breaking up of and injury to well-constructed streets in order to reach such mains and conduits can thereby be rendered an unknown element. We pay dearly for want of foresight in municipal arrangements, in the constructional

features of streets. In future city-design the opportunity undoubtedly exists for avoiding that continual waste of resource, which, turned to advantage in more lavishly equipping public institutions and in making the city ornate, can be so much better expended. An exhaustive consideration of the treatment of each street in regard to the necessity for tram or railways is also necessary to insure that the construction is developed on lines that avoid waste through the undertaking of various useless works or injury to necessary ones. It will be a wise economy also to make the foundations of all streets thoroughly, and in no way to stint the means for so doing.

The scheme of lighting to be adopted is an element in which decision antecedent to the development of the design is also requisite. Inasmuch as electric lighting does not involve, except at the generating station, any consumption of oxygen, and as the light itself does not produce those deleterious gases formed in the burning of coal gas, it is to be preferred wherever a start may be made *ab initio*.

More generally it may be said that the predetermination of the whole of the engineering or constructional features for the streets is essential to the design being so elaborated as to reduce the expense to an absolute minimum, and it is only through the initial location of such features that everything dependent thereupon can be consistently and harmoniously adjusted and the best results attained.

#### Size of Blocks between Streets.

If in any site the relation between the total area and that to be occupied as streets be antecedently assigned, the problem of ascertaining the size of blocks becomes numerically determinate as soon as the general scheme for the streets is decided. In Paris the streets cover an area of about one-fifth of the total, in Washington the ratio is still greater. With increase of street area, however, the construction and maintenance becomes correspondingly costly. The following suggestion as to suitable dimensions will sufficiently indicate the idea of general proportions:—

	Metres.
Public institutions, large factories and large establishments generally	100 x 200
Large suburban residences with grounds...	80 x 160
Larger business sites, city residences, &c.	60 x 120—160
Smaller establishments	40 x 80; 30 x 60—90; 20 x 60
Workmen's dwellings	10 x 30

If smaller areas than these last are admitted the elements of hygiene and beauty must be correspondingly sacrificed. The length of blocks may vary between, say, 100 and 200 metres, or, say, between 330 and 660 feet, and rear lanes be from 10 to 15 metres in width, say 33 to 50 feet.

#### Height of Buildings.

Apart from the impossibility of adequately dealing with fires breaking out in very high buildings and the consequent jeopardy to property generally, and apart also from any consideration of the æsthetic defects of such buildings, a certain height may be regarded as injurious, as unduly limiting the skyline, and as preventing sufficient access of direct and diffused sunlight to the properties in the neighbourhood. The question may be settled by considering the rectangular portion of the street system, adjusted to the N.E., S.W., and N.W. and S.E. positions. A review of the positions of the solar-shadow at different times of the day and year indicates that the height of buildings and the width of streets should be approximately of the same order. If a street have buildings immediately abutting on it, equal in height to its width, the maximum angle of sky transverse to the street is 53 deg. 8 min., and the minimum 45 deg. A skyline higher than 45 deg. is clearly too high, hence as a maximum limit the façade of any building abutting on the street should not be of greater height than the street. The façades will be better seen with a less angle; a two-thirds limit would, therefore, be preferable, *i.e.* a height of not more than two-thirds of the street width. Buildings standing back from the street frontage could, of course, be correspondingly increased in height.

(To be concluded.)

#### CULROSS MARKET CROSS.

THE market cross of Culross is being restored and re-erected through the munificence of Sir James Sivewright, K.C.M.G., of Tulliallan Castle. The work will be completed and the cross unveiled on July 1, 1902. When the project of restoration was first entertained, says the *Dunfermline Press*, the Rev Canon Bruce, Dunmarle Castle, Culross, acting for Sir James Sivewright, consulted Mr. J. W. Small, the well-known architect, who is an authority on Scottish market crosses, and recently published an elaborate volume on the subject. The following is quoted from Mr. Small's report on

the existing cross:—"The present shaft and arms of cross are comparatively modern, viz. 1819 date. The steps and old base are very much older, and I have not the slightest hesitation in saying they are as old as the date of the erection of the town into a royal burgh by James VI. in 1588. Consequently my attention was directed to existing market crosses in Scotland of this or later dates for precedents to restore the one under review. I consulted those in the immediately surrounding district, viz. Kincardine, Clackmannan, Stirling, Airth, Doune, Inverkeithing, &c., and have every confidence in submitting the design I have prepared as being in accordance with old precedents, and probably almost identical with that of the cross erected in 1588. On the front of the cross will be the burgh arms, with the date of the creation of the burgh (1588) in the tympanum of the pediment. On the side next the 'Study,' Sir James Sivewright's arms, with his initials in the tympanum. On the back panel the cypher of King James VI., taken from Mars Wark, Stirling, with the date of restoration in tympanum. In the remaining panel will be an inscription, and in the tympanum over it the provost's initials. Crowning all, the unicorn of Scotland holding in front of it the Garter of the Thistle, enclosing the Royal Arms of Scotland, similar to that on the Stirling Market Cross. The inscription referred to will be:—"Restored by the Hon. Sir James Sivewright, K.C.M.G., LL.D., of Tulliallan, July 1, 1902; John A. Erskine Cuninghame of Balgownie, Provost. E.R." [King's initials.] The character of the lettering will be taken from an old stone with the representation of the burgh seal, at present built up in the wall of the staircase to the belfry of the old Town Hall, Culross."

The following details from the specification will show how the work is to be done:—"The present shaft and cross-head to be removed and carefully erected on the 'Tron' (a square piece of masonry about 4 feet high, opposite Town House) The old steps and base are not to be interfered with (but will be prepared to receive the new cross). The shaft will be tapered from 15 inches square at base to 13½ inches at top, and will have a large splay off its four corners, to be in one stone 10 feet long, let into old base and fixed with a copper dowel 20 inches long. The cap to be moulded and carved as shown, and fixed to base with a copper dowel 18 inches by 1 inch. The panelled top will be in one stone, 25 inches high, with pilasters at angles and carved on the four faces as follows:—Front face, arms of Culross; 2nd face, arms of Sir James Sivewright; 3rd face, cypher of King James VI. from Mars Wark, Stirling; 4th face, inscription of donor. The cornice to be in one stone with four curved pediments and seat for unicorn, and the pediments to be curved in each tympanum as follows:—Front, date of creation of burgh, 1588; 2nd, initials of Sir James Sivewright; 3rd, date of restoration, 1902; 4th, initials of Provost Cuninghame. The apex will be a unicorn sitting on its haunches, same as on Stirling market cross, and holding in front of it the collar of the Order of the Thistle and the Royal Shield bearing the Arms of Scotland. The present well at foot of cross to be removed to side of house opposite."

After Mr. Small had prepared all the drawings and made the arrangements for proceeding with the work, he received an appointment in South Africa, which necessitated his removal thither in the beginning of December last. He has left the work in the hands of Mr. Alexander Neilson, sculptor, Dundee, to be carried out under the superintendence of Mr. William Gaudie, architect, Panmure Street, Dundee.

## SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE usual monthly meeting of the Society of Antiquaries of Scotland was held in their library at the museum, Queen Street, Edinburgh, on Monday evening, Mr. David Murray, LL.D., vice president, in the chair. The first paper was a report on the excavation of the Roman camp and other works at Inchtuthil, which the Society had been induced to undertake last season on the invitation of the proprietor, Sir Alexander Muir Mackenzie, of Delvine. The report was given in two sections, the excavations being described by the Hon. John Abercromby, and the plans of the camp and the structures connected with it by Mr. Thomas Ross, architect. The operations began in February last, and were continued till the end of August, under the supervision of Mr. Alexander Mackie, who has been in charge of the Society's excavations at several other Roman sites. Inchtuthil, on the left bank of the Tay, close to Delvine, and about seven miles south-east of Dunkeld, is an ideal site for a fortified station. It is a flat plateau of somewhat triangular shape, comprising an area of about 250 acres, the banks rising steeply to a height of about 55 feet, and further protected by the marshy ground below, and partly encircled by the river. The front of the camp was constructed parallel to the least broken side of the plateau. Though its ramparts are

much obliterated, the general form is still traceable as a square of about 55 acres, each side measuring 520 yards. The ramparts were 20 feet wide, with a ditch also 20 feet in width, and from 6 to 7 feet deep. The rampart was doubled on the south-east side where the natural defence was weakest. A road 20 feet wide divided the area within the ramparts into two unequal parallelograms. There were no foundations of permanent buildings or other signs of a protracted occupation found in the interior of the camp, but fragments of querns and Roman pottery were sure evidence that the occupation had been for more than a few nights. The better to defend the access to the south-east there was a rectangular redoubt about 170 yards long and 130 yards wide about 150 yards from the camp. There were no traverses in front of the gateways. The best evidence that the camp was intended to be occupied for some considerable time was supplied by the discovery of a Roman bath, placed about 100 yards outside the south-east corner of the ramparts. It had a frontage of 125 feet and was 75 feet in width, and was partly surrounded by a ditch 5 feet deep. Outside the ditch were foundations of buildings disposed in the form of a short street. Near this corner, on the outer face of the inner rampart, three large ovens were brought to light. The camp and redoubt, however, are not the only earthworks on the plateau. Its south-west angle had a slightly rounded end, about 90 yards long by 60 yards wide, which is defended by five ramparts and as many ditches drawn across from edge to edge of the steep slopes that surround the point. The site of a hut, roughly paved with flat stones, was found within the area of this fort. But as there was nothing to indicate Roman occupation, the probability is that this extreme end of the plateau was a native fort of a time later than the Roman invasion. After referring to the notices of Inchtuthil by Maitland, Pennant, Pococke, Roy and other writers of the eighteenth century, and pointing out that the Roman building mentioned by more than one of them as lying to the west of the camp could not be the bath now discovered, Mr. Abercromby passed to the consideration of the probable date of the camp. Unfortunately the objects found in it, consisting chiefly of Roman pottery and tiles, with a few harness mountings of bronze, included no inscriptions and only one coin, much oxidised, but most probably an early issue of Domitian. It was thus possible that the camp may have been occupied by one of the legions of Agricola, but in the absence of better evidence the date must remain an open question. A tumulus, known as the Woman's Knowe or Gallows Knowe, lies about 50 yards to the east. When excavated it was found to be surrounded by a ditch at the base, and to consist of a clayey loam capped by a layer of water-worn stones about 2 feet deep, the height of the tumulus being about 6 feet and its diameter 93 feet. In the centre was a cist containing an unburnt burial at full length and oriented, the head to the west and the feet to the east. Nothing was found to give a clue to the period, but it was probably later than the Roman time, as another burial in a tumulus on the top of the rampart certainly was. A third tumulus, excavated at the same time at Ruffel, contained a cremated interment. Mr. Thomas Ross, architect, gave a description in detail of the various works connected with the camp, and of the bath building and its different rooms, illustrated by diagrams and lantern slides, with many photographs. The next paper was a record of explorations in the cairns of Arran, with an anatomical description of the human remains discovered by Dr. T. H. Bryce, of Glasgow University. The work was begun on the initiation of Dr. Ebenezer Duncan, of Glasgow, who had made a partial examination of a cairn near Lag, and subsequently invited Dr. Bryce to undertake a thorough examination of it and another near it. This having been done by permission of the factor, Mr. Auldjo Jamieson, with some novel and interesting results, suggesting a more extended series of investigations to determine, if possible, the relative age of the cairns and of the remains of their builders, a grant was obtained from the Society for this purpose, and the results now gathered, along with those obtained in 1860 by Dr. James Bryce, LL.D., from exploration of the stone circles of Arran, give a fairly complete view of the prehistoric sepulchral monuments of the island. The structures explored fall into three groups—cairns enclosing megalithic structures, cairns with single short cists, and cists within the area of circles of standing stones. Of the first class, four examples, at Torlin, near Lag, at Clachaig, on Sliderry Water, and near Shiskin, were fully excavated. At Torlin and Clachaig the cairn was still in great part extant, but elsewhere the megalithic structure stands denuded. It consists usually of great slabs set on end or on edge, in the form of a trough-like chamber, subdivided into compartments, or a series of megalithic cists placed side to side. Probably in all cases the chamber was roofed in by large flags. At Torlin and Clachaig were found remains of several individuals of both sexes and all ages in heaps in the corners at different levels. At the other sites the presence of charcoal layers indicated cremation, and the bones of domestic animals pointed to the practice of a funeral feast. The implements found were all of stone, mostly of flint, but one polished axe and a polished

perforated hammer were also found. The pottery consisted, of round-bottomed vessels of dark ware, either undecorated and with rude projecting ears, or with an almost horizontal brim, decorated with straight lines and dots. At Beachana, in Kintyre, a similar cairn was explored in 1891 by the Kintyre Scientific Association, of which no record was published, but the writer was indebted to Mr. Gray, of the Marine Biological Station at Millport, for the facts, and to the authorities of the Campbelltown Museum for the opportunity of describing the relics. These were a flint implement, a shuttle-shaped ornament of jet and six urns of the same type as those from Arran. In Islay two cairns of the same class yielded corroborative results. The only cairn of this type previously described in Scotland is one near Crinan, explored by Canon Greenwell in 1864. These examples form one group, to be classed with structures of analogous character in Ireland, about which, however, little is known. They must all be referred to the Stone Age. The pottery is of Stone Age type, but certain specimens are of a form hitherto unknown for vessels of this size in the British Isles. In regard to the second group of cairns enclosing short cists, such cists were found in the Clachaig megalithic cairn as secondary interments, in an oval mound at Clachaig called Ossian's Grave, in a small round cairn at Brownhead, and also within the circles of standing stones on Mauchrie Moor, explored by Dr. James Bryce. These cists yielded flint implements, jet beads and a bronze pin, and they all contained pottery consisting of flat-bottomed urns, richly ornamented and quite different in type from the pottery of the megalithic cairns. Some of them enclosed burnt bones, some fragments of unburnt bones, and one a skull, which could be measured. At Blackwaterfoot there stood a large cairn, now demolished. Working on its site, Mr. Thomas Wallace recently exposed a cist in which was a bronze dagger blade with longitudinal triple mouldings, and the rivets by which it was affixed to the handle, accompanied by a fluted gold fillet, which seemed to have ornamented the hilt. These were generously presented to the National Museum by Mr. Wallace. No pottery or bones were found in the cist, which was subsequently examined and the remainder of the cairn investigated without further result by the writer. All these short cists, whether in cairns or stone circles, seem to belong to the Bronze Age. The human remains in the megalithic chambers were those of a race of short stature, with oval-shaped heads, long oval faces, and short, narrow and weak jaws. They are of the same type as the long barrow people of England. The skull found by Dr. James Bryce in a cist within a circle is broad, and of an entirely different type. The local contrast in the structural features of the monuments, the character of the interments, the nature of the implements, and especially of the pottery, indicates a succession in the early occupation of Arran—a long-headed race in the stage of Stone Age culture, succeeded by a broad-headed race acquainted with bronze, who must have made a long stay before the culture of the Iron Age reached them. The paper was illustrated by large diagrams and lantern slides.

## TESSERÆ.

### Process in Sculpture.

LITTLE change has taken place in the processes used in the fine arts during the many ages in which they have been practised. Even the few novel inventions that have been brought to bear upon them have tended in no way to improve their quality; some, on the contrary, have been found rather to detract from their excellence than otherwise. The only change which new discoveries have created in the fine arts has been the saving of time and labour, the multiplying of copies with greater facility, and the consequent cheapening of cost. It may be fairly presumed that the ancient Greeks and Romans, in the palmy days of sculpture, employed much the same methods in working their statues as do the artists of the present day. It is true there is no direct evidence of their having modelled them previous to commencing the marble, but their terra-cottas and bronzes show indubitably their knowledge of modelling in clay, and their acquaintance with the processes of moulding and casting; and it is but fair, especially when we consider the excellence of their marble figures, and the numbers which they produced, to infer that they must have applied that knowledge to facilitate the working of them. It is probable, again, that the manner of taking measurements on the marble from the model was much about the same as it now is. The Italians, a people not noted for throwing aside old notions, or much addicted for exchanging old lamps for new, still adopt the most simple plan for this purpose, that of dropping plumb-lines from fixed points over model and marble in order to ascertain the relative position of parts.

### Materials Employed in Ancient Sculpture.

The ancients employed a greater variety of substances for their statues and groups than the moderns. Many of them, however, were chosen merely because they were the native productions best suited to the object—for instance, the syenites, basalts and granites of the Egyptians. Then, again, the Greeks were fortunate enough to possess within their own islands the beautiful Parian marble of which their ancient statues are composed; and the Italians have had the advantage of a white limestone existing in their own country, superior even in purity and fineness of crystal to that of the Greeks, and this last, commonly known by the name of statuary marble, is that now chiefly employed in sculpture. Vitrified substances were in use among the ancient Egyptians for small works; as may be seen from specimens in the British Museum. They were in the habit, too, of employing more than one material in the same work; for example, of making the statue itself of wood or stone, with glass or jewels inserted for the eyes, and the draperies and ornaments of metals. The Israelites, who in all probability adopted most of the methods of the Egyptians, followed this plan also, for frequent allusion is made to it in the sacred writings. Indeed, if we consider the method which Moses used to destroy the molten calf, as described in two distinct places—Exod. c. xxxii. v. 20, and Deut. c. ix. v. 21—we shall perceive that, though generally understood as a molten image, it must have been composed of either wood or stone—probably the former—and merely decorated with molten ornaments, for had it been entirely cast or molten he could not have ground it to dust, nor have strewn the ashes in the brook, as he is said to have done. The ancient Greeks employed not only marble and bronze, but ivory and gold. The ivory was cut into thin plates and laid on the surface, by which a beautiful flesh-like colour was imparted to the naked portions of the statues, while the precious metals served to give colour to the drapery.

### Grandeur in Painting.

Grandeur refers less to the subject than to the manner in which it is treated. It consists, firstly, in making everything subservient to the principal object in view; secondly, in avoiding the introduction of anything that may interfere with that object; and, lastly, in the absence of any peculiarity of execution which shall lead the mind from its proper duties. And thus it arouses the deepest feelings of the observer, to the utter exclusion of all minor sources of delight. No matter what may be the nature of the subject it treats of, tragic or comic, sacred or profane, domestic or historic, its presence will ever be felt throughout the whole work. It is this quality which marks the difference between the sublimity of Michel Angelo and the pretension of his imitators, between the expression of Raphael and the insipidity of Carlo Dolce, between the grace of Correggio and the affectation of Barroccio, between the glow of Titian and the glare of Rubens, between the fertility of Paul Veronese and the exuberance of Pietro da Cortona, between the solemnity of Tintoretto and the gloom of Caravaggio, between the simple truth of Velasquez and the obtrusive materialism of Ribera, between the elegance of Vandyke and the allurements of Lely, between Rembrandt and Ferdinand Boll, Ostade and Metz, Jan Steen and Teniers, De Hooe and Terburgh, Cuyp and Both, between Reynolds and Lawrence and, lastly, between Turner and every landscape-painter who lived before him. It has often been said that this quality depends in a great measure on the mere dimensions of a work, and no doubt as regards natural scenery and architecture the observation is partially correct. The Colosseum at Rome is grander than the amphitheatre at Verona, and the Swiss mountains than those of our own country; but with respect to the human form we need no evidence beyond what colossal sculpture affords to prove that size instead of imparting grandeur has often a contrary effect; and were an artist to paint a man 20 feet high (witness the *Satan* by Lawrence) he would only arouse a feeling akin to that produced by the sight of monster gooseberries which we hear of in the dull season. There can be no doubt that in pictorial illustrations a great advantage is derived from employing the average standard of the human figure, but that such a practice is not absolutely necessary to impart grandeur may be proved by many works.

### Ancient Irish Churches.

That the unadorned simplicity and contracted dimensions of the earliest Irish churches were not at least altogether the result of poverty and ignorance of the arts in their founders appears to be extremely probable. Poor those honoured individuals unquestionably were, but that poverty generally, if not in all instances, appears to have been voluntary, as became men walking in the footsteps of the Redeemer, and who obtained their simple food by the labour of their hands; but that they were ignorant of the arts or insensible to their influence could scarcely have been possible in men, very many of whom—Romans, Gauls and Britons—were educated where those arts, though they had become debased, were still culti-

vated, and we have not only abundant historical evidence to show that many of the ecclesiastics in those early times obtained celebrity as artificers and makers of the sacred implements necessary for the Church and as illuminators of books, but we have also still remaining the most indisputable evidences of their skill in those arts, in ancient croziers, bells, shrines, &c., and in MSS. not inferior in splendour to any extant in Europe. It is indeed by no means improbable that the severe simplicity, as well as the uniformity of plan and size which usually characterises the early churches of Ireland, was less the result of the poverty or ignorance of their founders than of choice, originating in the spirit of their faith or a veneration for some model given to them by their first teachers; for that the earliest Christian churches on the Continent before the time of Constantine were, like these, small and unadorned, there is no reason to doubt, and the oldest churches still remaining in Greece are similar to those in Ireland.

#### Destruction of Rood-Lofts.

The order of Edward for the taking down of roods applied, in the first instance, simply to the removal of the rood figures, *per se*, being afterwards erroneously concluded to extend to the rood-loft or gallery of access to them. This gallery was formed on the upper beam of the screen, into which the joists of it, with the supporting timbers of the rood figures, were framed, and its either side was defended or fenced in by a parapet along its length, to secure safe passage across. It was this gallery or passage to, and as such, connected and associated with, the objected-to rood figures that it was the object of the reformers of Elizabeth's time to do away with, as is very clearly and explicitly shown by her order. The indiscriminating ignorance and prejudice of the age, however, failed to distinguish between transposition, "transposed" being the word of the order, and destruction, as it had already done between reformation and abolition, and from the lack of a clear understanding or a wilful misconception of former orders, had with the rood-gallery and its figures pulled down, and were continuing to pull down, the entire upper portion of the screen, extending the demolition in some instances to the entire structure of it, leaving them as that at Southwold, and in a number of other cases, is now seen stripped to their naked framing and entirely denuded of their upper part. To this condition it was not the authorised intention to reduce them. Elizabeth's order clearly defines the extent to which they were to be altered and the mode in which they were to be finished and left after such alteration. The words are as follows:—"It is thus decreed and ordained that the rood-lofts"—roods had already been previously for the most part removed—"as yet, being at this day aforesaid, untransposed, shall be so altered that the upper part of the same with the soller"—an old term for an upper storey—"be quite taken down unto the upper parts of the vautes" (vaulting) "and beam running in length over the said vautes, by putting some convenient crest upon the said beam towards the church;" that is to say, the rood-loft or gallery was to be taken down to the beam or cornice above the groined canopy or vault, and was there to be finished with a crest ornament or brattishing, the common mode of finishing such a cornice or termination.

#### GENERAL.

**Mr. James Ponsford, M.I.C.E.**, died at Cairo on January 2, after a very brief illness. Mr. Ponsford had been engaged for many years in leading positions, as an engineer, upon the construction and working of railways in European and Asiatic Turkey, and had received the Medjidieh of the Fourth Class from the Sultan for his services.

**Professor J. H. Marshall**, late of King's College, Cambridge, and for three years past associated with Mr. Bosanquet in archaeological researches at Athens, has been appointed by the Secretary of State for India the first Director-General of the Archaeological Survey of India, for a period of five years in the first instance.

**The Harrogate Town Council** have decided to erect a new town hall at a cost of 40,000*l.* Competitive designs are to be sought.

**In Memory** of the late Sir A. W. Blomfield, under whose direction St. Mary's Church, Bryanston Square, W., was improved and adorned, and who was an active and earnest parochial worker for many years, a brass tablet has been affixed to the south-eastern wall, near the doorway of the church.

**Mr. E. B. J. Knox**, finding the conditions again favourable, has resumed practice in Johannesburg as architect and civil engineer.

**Mr. M. Sullivan** will read a paper before the Society of Architects on Thursday next entitled "Early British and Celtic Art."

**The Duke of Marlborough** has offered to the Corporation of Oxford a large picture, "The Rape of the Sabines," painted by Pietro da Cortona. The gift will be formally accepted at the next meeting of the city council, and will be placed in the municipal buildings.

**The Brighton Town Council** propose to expend a sum of 45,000*l.* on the construction of a system of telephones.

**A Committee** has been formed to carry out the plan for the restoration and preservation of the well of the Venerable Bede at Monkton Dene.

**The Salary** of Mr. McCarthy, architect to the Corporation of Dublin, has been fixed at 750*l.* a year.

**Mr. Joseph M. Houston**, of Philadelphia, has been selected as architect for the new Capitol to be erected at Harrisburg.

**The Earl of Idlesleigh**, chairman of the Royal Commission on Sewage Disposal, has sanctioned the appointments of Miss Harriette Chick, B.Sc., and Miss M. O. Power, former students of the Bedford College for Women, as assistants to Dr. Houston, chief bacteriologist to the Commission.

**The Council** of the Royal Society of Painter-Etchers and Engravers have elected the following Associates of the Society:—M. E. Kershaw, B. Gorst, Hermann Struck and L. Taylor.

**Mr. Arthur Henry Newton**, of the firm of Winsor & Newton, Ltd., artists' colourman, Rathbone Place, has left property valued at 105,955*l.* 5*s.*

**The Yarmouth Town Council** have decided, in spite of all protests, to demolish for the sake of street improvements the northern portion of an old flint wall which was built in 1395.

**Mr. Goscombe John** has presented to the Devonshire Hospital, Buxton, a plaster statue of the late Duke of Devonshire.

**The Local Government Board** have approved of the expenditure of 79,468*l.* in connection with the Joyce Green Hospital, and of a contract being entered into with Messrs. Leslie & Co. for the erection and completion of the additional pavilions, isolation hospital and other works connected with the scheme without first advertising for tenders.

**The Estimate** of the cost of constructing the electric railway between Brighton and London is in round figures 7,338,403*l.*, apportioned as follows over the three lines:—Railway No. 1, 607,580*l.*; ditto No. 2, 2,240,176*l.*; ditto No. 3, 4,490,647*l.* It is proposed to spend 330,000*l.* on stations; accommodation bridges and viaducts, 1,128,361*l.*, and 2,408,720*l.* on tunnels. The cost of the line is estimated at about 7,310*l.* per mile.

**Mr. John Galen Howard**, of New York, who has been preparing the plans for the new mining building for the University of California at Berkeley, is to be superintending architect for the execution of plans for the greater University designed by M. Bénard, of Paris.

**The Finance Committee** of the Liverpool Corporation have been considering the proposed acquisition of part of St. James's Mount by the cathedral committee as a site for the Cathedral, and, after considering the joint reports of the town clerk, the controller of accounts and the corporation surveyor, have adopted a resolution to the effect that, so far as that committee is concerned, the preamble of the Liverpool Cathedral Bill should not be opposed.

**The Foundations** of the ruins of Lewes Priory are now visible, but the excavations are shortly to be filled in.

**The Lighting Committee** of the Brighton Town Council recommend that Mr. W. R. Galbraith be engaged as consulting engineer in connection with the electric power house works now in progress at Southwick, under Messrs. Pedrette & Co's contract, at the inclusive fee of 3½ per cent. on 25,000*l.* (875*l.*), the Corporation to pay in addition the wages (about 3*l.* per week) of an inspector, to be recommended by Mr. Galbraith.

**The Third Members' Meeting** of the Liverpool Architectural Society will be held at 6 P.M. on Monday next, the 20th inst., in the Law Library, 41 Castle Street, Mr. P. C. Thicknesse in the chair, when a paper will be read by Mr. R. Wynne Owen, A.R.I.B.A., on "The Value of Sketching," which will be accompanied by lantern slides and some examples of original sketches by well-known architects.

**Mr. H. Ricardo** will read a paper on "The Architect's Use of Enamelled Tiles" at the meeting of the Applied Art Section of the Society of Arts on Tuesday next at 8 P.M.

**The Annual Meeting** of the Royal Society of Antiquaries of Ireland will be held in Dublin on the 28th inst. The Council find it necessary to draw attention to the fact that a considerable proportion of members still fail to pay their subscriptions, though deriving all the benefits of membership, and receiving the publications which are produced at so much cost. A list of those in arrear was read out at the annual general meeting of the Society held in January last, and forty-four members were struck off the roll.

THE

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

**BATTERSEA.**—Jan. 31.—Premiums of 50*l.*, 25*l.* and 10*l.* respectively are offered for the three best sets of designs, &c., of dwellings, as follows:—(a) A house of two storeys; (b) a house consisting of two self-contained tenements; and (c) a house consisting of three self-contained tenements. Mr. W. Marcus Wilkins, town clerk, Municipal Buildings, Lavender Hill, S.W.

**GLASGOW.**—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

**HULL.**—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

**IRELAND.**—Jan. 20.—Plans, &c., are invited for drainage of Howth and Sutton, Dublin (and an alternative system for the latter). A premium of 50*l.* is offered. Mr. John O'Neill, clerk, board-room, North Brunswick Street, Dublin.

**ISLE OF WIGHT.**—Jan. 31.—Designs are invited for a suitable monument as a memorial to Her late Majesty, to be erected in St. James's Square, Newport, Isle of Wight. A premium of 25*l.* is offered for the accepted design. The Secretary, Isle of Wight Queen Victoria Memorial Committee, 20 Holyrood Street, Newport, Isle of Wight.

**LANGHO.**—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200*l.*, 150*l.* and 100*l.* respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**LIVERPOOL.**—Jan. 31.—Applications are invited from architects willing to submit designs in a limited competition for rebuilding the Liverpool Infirmary for Children. Colonel C. Forbes Bell, Eagle Chambers, 17 Fenwick Street, Liverpool.

**WALES.**—Feb. 4.—Competitive designs are invited for municipal offices proposed to be erected by adapting, adding to and rearranging the town hall buildings at Mountain Ash. A premium of 75*l.* will be paid to the author of the design placed first in order of merit. Mr. H. P. Linton, clerk, Town Hall, Mountain Ash.

## CONTRACTS OPEN.

**BARKING.**—Jan. 24.—For supply and erection of additional electricity generating plant. Mr. E. H. Lister, clerk, Public Offices, Barking, Essex.

**BARNESLEY.**—Jan. 25.—For erection of a villa residence, surgery, stables, &c., at Worsborough Bridge, near Barnsley. Messrs. Senior & Clegg, architects, 15 Regent Street, Barnsley.

**BEDFORD.**—Jan. 21.—For erection of a corrugated iron hospital and outbuildings, &c., near the present isolation hospitals belonging to the Corporation, and for alterations and additions to the existing hospitals. The Borough Surveyor, Town Hall, Bedford.

**BERMONDSEY.**—Jan. 20.—For construction of three underground conveniences. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BIRMINGHAM.**—Jan. 24.—For erection of stabling, roller-house, workshops, offices, workmen's dwellings, together with certain other works, including the covering of Hockley Brook, paving yard, &c., Aston Manor. Mr. G. H. Jack, surveyor, Council House, Albert Road, Aston Manor.

**BLACKPOOL.**—Jan. 29.—For erection of a station at South Shore, Blackpool, for the Lancashire and Yorkshire and

**FREE TO ARCHITECTS.**  
**A PRACTICAL TREATISE ON**  
**WARMING AND VENTILATING**  
**IN APPLICATION TO THE**  
**STURTEVANT ENGINEERING CO. LD.**  
**47 QUEEN VICTORIA STREET, LONDON.**

London and North-Western Joint Railways. Mr. R. C. Irwin, Secretary, Hunt's Bank, Manchester.

BOOTLE.—Jan. 21.—For wiring of the baths, library, &c., in Marsh Lane, Bootle, Lancs, for the purposes of electric lighting. Particulars may be obtained at the Borough Electricity Works, Pine Grove.

THE appearance of Unter den Linden and other principal streets in Berlin will be shortly much improved by their being repaved with asphalt, a municipal reform for which it is announced that a sum of 175,000*l.* has just been granted. Hitherto, as compared with the handsome and fashionable streets of Paris and even "ugly and dirty" London, the famous Berlin thoroughfare has distinctly suffered by the retention in the carriageways of the old-fashioned and unsightly, if pre-eminently durable, method of paving. In future Unter den Linden should be a thoroughfare of which all Germans may be rightly proud.

#### ELECTRIC NOTES.

THE promoters of the London and Brighton Electric Railway have deposited the sum of 370,000*l.* as a guarantee that the Bill will be proceeded with in the ensuing session. The Examiner of Petitions (Mr. Campion) will hear the parties or memorials in opposition to private Bills on Saturday next. It is expected that the opposition of the Brighton Railway Company and the landowners on the route of the proposed railway will occupy a considerable time. Probably the hearing will take place on the 24th inst.

IN connection with the celebrations on the occasion of M. Waldeck Rousseau's visit to St. Etienne on the 12th inst. and the opening of the new prefecture buildings, the French representatives of Electric Lighting Boards, Ltd., received from the Government the order for the electrical illuminations, the extent of the contract being 1,250*l.*, and including as many as 4,000 lamps. A further important contract has also been obtained by the French representatives of Electric Lighting Boards, Ltd., from the Paris Illumination Company, comprising no less than 30,000 feet of flexible cable, 1,000 superficial feet of boards and 15,000 lamps.

THE Leicestershire and Warwickshire Electric Power Bill, which is to be proceeded with in the coming session of Parliament, provides for the erection of generating stations in the counties of Warwick and Leicester for the supply of electrical energy to authorised undertakers, but the promoters of the company have also inserted a clause in the Bill to the effect that nothing in the Act shall prevent them from applying for provisional orders to supply electricity for domestic and lighting purposes. The proposed measure has already been

mentioned at the meetings of several of the local governing bodies of Warwickshire comprised in the area to be covered by the Bill, and one of these—the Leamington Town Council—has appointed a committee to consider the matter. The generating stations are proposed to be erected at Newbold-on-Avon, near Rugby; at Whitacre Station, near Shustoke; and at Leek Wootton, near Warwick. The area is an extensive one, the unions it comprises including Stratford-on-Avon, Southam, Rugby, Meriden, Coventry, Foleshill, Lutterworth, Nuneaton, Atherstone, Tamworth and that portion of the Aston Union not comprised in the county borough of Birmingham. The capital of the company is to be 750,000*l.* in 75,000 shares of 10*l.* each.

WITH admirable foresight the Corporation of Wrexham acquired some few years since suitable property on which to establish a dépôt providing for, among other things, the supply of electricity for lighting and other purposes. This property, the Willow Brewery to wit, has cost comparatively very little in its conversion, and the Corporation have now a very complete installation, including an electric station, for which a destructor supplies the power required, baths, stables, and accommodation for all the rolling stock. The destructor consists of four grates, combustion-chamber, boiler, regenerator and hot-air conduit. The furnaces are fed by hand. The regenerator is constructed of cast-iron tubes, arranged to heat the primary air of combustion to a temperature of about 350 degs. Fahrenheit, by means of the waste gases passing through them. The furnace-chamber is common to all four grates. The ash-pit is divided into four parts by brick division-walls. Each ash-pit division is enclosed and has a separate steam jet-blower fixed to internal cast-iron up-takes and pipe connections, enabling the working of each single grate to be regulated to suit the varying quality of the refuse and the thickness of the flues, without in any way impeding or affecting that of the other grates. The boiler up-takes are connected with the hot-air conduit of the regenerator. One grate is cleaned and charged while the other is in a state of incandescence, and the gases from the fresh charge mingle with those from the incandescent flues and become innocuous. The gases from each furnace pass through an opening at the back into the combustion-chamber, where dust is disposed of, through and round the boiler in the usual way, and finally through the regenerator tubes and main flues. The cold air enters at the back of the regenerator, circulates round the tubes, where it becomes

COTTAGE HOMES, DRYMEN, N.B.

eated, and passes along the conduit to the furnace. The consumption of refuse is at the average rate of forty tons in twenty-four hours, and the heat generated passes to a steel wo-flued Lancashire boiler, which works at a pressure of 60 lbs. Throughout last month, except on Sundays and during the Christmas holidays, the whole of the steam for running the station by electricity was generated exclusively from the refuse of the town, coal being used only on holidays, when the dustmen are not working. The units of electricity generated daily ranged from about 400 to over 900, and the units generated per ton of refuse averaged nearly 38.

## TRADE NOTES.

MACKAY'S patent direct-acting ventilators, of an ornamental design, supplied by Messrs Cousland & Mackay, ventilating engineers, Glasgow and Manchester, have been used for the ventilation of the new Board schools, Glyn Neath, Wales.

THE Corporation Temporary Hospital, Southport, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke flues by Messrs. E. H. Shorland and Brother, of Manchester.

MESSRS. D. WITT & CO., of Drummond Street, N.W., draw our attention to the fact that they have just imported a very large parcel of knife-cut and sawn-cut Rio rosewood veneers of exceptionally fine colour and figure, and some very fine parcels of knife-cut Bombay rosewood, of which they are the sole importers, and claim to be the largest holders in the world. They also tell us that they have some good lines in plank walnut and Burr walnut veneer, very reasonable in price, and excellent in figure and colour.

## BUILDING AND BUILDERS.

MR. G. T. HINE'S plans have been accepted for the erection, at a cost of 39,600*l.*, of the proposed extensions to the Dorset County Asylum.

MR. A. A. G. MALET, A.M.I.C.E., inspector of the Local Government Board, held an inquiry at Forest House, Chester, regarding an application of the Chester Rural District Council for sanction to borrow 26,000*l.* for the purpose of sewerage and sewage disposals for the townships of Bache, Christleton, Great Boughton, Newton-by-Chester and Upton (including the construction of works in the city of Chester), and for sanction to the communication of the sewers of the Rural District Council with those belonging to the city of Chester. The estimated cost was 12,027*l.* 16*s.*, and the loans to be asked for were as follows:—Bache, 450*l.*; Newton, 6,800*l.*, and Upton, 6,192*l.* There was practically no opposition to the scheme.

THE annual meeting of the York Master-builders and Contractors' Association was held on the 10th inst. at the Old George Hotel, Pavement, the president (Councillor G. Mansfield) in the chair. The annual report, which showed a very satisfactory year's working, was read and adopted. Councillor Mansfield was unanimously re-elected president, and Mr. C. Prudames was re-elected vice-president. The Association has been honoured by the election of the president (Councillor Mansfield) to the position of President of the Yorkshire Federation of Building Trades Employers. The thanks of the Association were accorded to the president, vice-president and treasurer for their services during the past year.

A BRICKLAYER named Alfred Ashton, of Frederick Street, Walsall, has had a remarkable escape from death. He was working on the erection of a new chimney stack at the works of Messrs. Beebee, curriers, Green Lane, and when being drawn up he by some means lost his hold and fell a distance variously estimated at from 50 to 70 feet. His fellow workmen expected the consequences to be very serious, but they found the man alive, and at once took him to the hospital. He did not stay there, the statement of his friends being that after waiting for an hour and a half he had not been seen by a doctor, and they decided to obtain aid elsewhere. They accordingly removed him home, and called in Dr. Martland, who found that although he was suffering severely from shock no bones appeared to be broken. The circumstances generally were subsequently a theme of much comment.

LONDON, W.

Council Chamber at Hemel Hempstead, fitted and furnished by HEWETSONS.

It is proposed to erect a new block of buildings, to be called the "King Edward VII. Home for Nurses," adjoining the main building of the North Staffordshire Infirmary, at Stoke-on-Trent. The building is to accommodate fifty nurses, and is to be joined to the infirmary by a covered way. It is intended as a memorial of the Coronation year of the King, who, with his Consort, as Prince and Princess of Wales, laid the foundation-stone of the main building of the infirmary in 1866. The cost is estimated at 10,000*l*.

An alarming accident occurred about noon on Wednesday in Liverpool. An iron girder about 20 feet in length was being hoisted by a crane into position at a new building being erected at the corner of Dale Street and North John Street when it slipped from the chains and dropped a distance of nearly 50 feet on to the roadway in Dale Street. In falling the beam dropped across the electric tram wire, snapping it and causing a flash of great brilliancy. At the time of the occurrence the street was crowded with pedestrian and vehicular traffic, but fortunately no one was injured. For some time traffic was entirely stopped.

### VARIETIES.

A SCHOOL, erected by the Dunfermline Burgh School Board at a cost of between 7,000*l*. and 8,000*l*., has just been opened.

At Birmingham on Monday evening Sir John Holder, Bart., gave a banquet at the Grand Hotel in celebration of the completion of the work of the general and building committees of the new General Hospital.

At a meeting of the Harrogate Town Council on Monday evening it was resolved to invite competitive designs for a new town hall, the cost of the building not to exceed 40,000*l*., and it was decided to offer prizes of 150*l*., 100*l*. and 75*l*.

THE Duke of Norfolk has offered to pay the local Town Council a sum of 31,000*l*., and to present them with 48 acres of land in an adjoining parish, in order to secure possession of a portion of the corporate property of Arundel, so as to preserve the view from Arundel Castle. The offer has been accepted.

SCHOOLS have been opened at Sutton Coldfield in connection with the Congregational church. They have been erected by Messrs. W. Lee & Son, of Aston, from the plans of Mr. Harry H. Reynolds, architect, Birmingham and Sutton

Coldfield, at a cost of 2,500*l*., and will afford accommodation for 350 scholars.

WITH the sale by Messrs. Douglas Young & Co. on the 22nd inst. of the corner site adjoining the "Old Bell" in Fleet Street, the important improvement at this end of the thoroughfare will be completed. The erection of modern buildings on these sites is removing all traces of the past in this most interesting part of Old London.

THE sexton of Holy Trinity Church, St. Anne Street, Liverpool, was passing the building on Wednesday morning when he heard a tremendous crash, and, rushing into the church, found that a portion of the roof had fallen in as the result of a fire. The edifice, which was built in 1792, was most substantially constructed, the walls being of great thickness. Unfortunately one of the principals was built nearly into the flue, and this became overheated. The woodwork at the top of the wall caught fire, and the end of the fallen principal and other portions of the woodwork were gradually charred, and smouldered away until there was no support left. The damage is estimated at 500*l*.

AT Barnsley Town Council on the 14th inst., Ald. Raley, chairman of the water committee, made an important statement on the position of the Midhope water scheme. The amount the Council were authorised to borrow under their Act was 185,657*l*., which included 15,657*l*. for Parliamentary expenses. Up to last September they had expended 164,934*l*., leaving 20,723*l*. still unexpended; and at that time it was estimated that the total amount required to finish the work was 122,360*l*. Towards that sum they had certain sums in hand, &c., which brought the amount actually required for waterworks to 85,637*l*.; but by their agreement with Sheffield they had to pay 25,837*l*., so that the total amount now required was 111,474*l*. This increased expenditure, Mr. Raley remarked, was due to a variety of causes—rise in prices since 1894, enlargement of puddle-trench, &c. Notwithstanding the largely increased cost, he was very hopeful that the reservoir would be provided without having cost the ratepayers a single penny. Mr. Foulstone said the Council's water estimates were like the Government's war estimates.

At a special meeting on Tuesday evening the Colwyn Bay Urban Council unanimously resolved to promote in the ensuing session of Parliament a Bill empowering them to spend 135,000*l*. on sea defences, promenade works and a scheme of sewerage, this sum being exclusive of the 54,000*l*. due in respect of the gasworks purchase. The proposed Bill con-

d also to give them power to advertise the attractions of  
olwyn Bay.

A LANDSLIP, apparently the result of the recent flooding,  
as occurred at Roslin Castle. The castle, as numberless  
ourists are aware, is built on a knoll, the east side of which  
neers down in a precipitous escarpment to the river, whilst  
the western side slopes down at what engineers would consider  
an angle of safety. The numerous large stones brought to  
ght by the slip would appear to have been placed in the  
ground to give it solidity, and the trees which grew upon the  
surface testified to a security which had not been disturbed for  
considerable period. At the foot of the slope is a bridge  
which connects the path from Roslin Bleachfield with that of  
the castle and to the village itself. Commencing at the walls  
of the castle and extending down the slope in a V form, the  
lip was stayed by a fence at the foot, but not before it had cut  
off communication at the bridge, altered the appearance of the  
landscape, and left the ground in a ragged and unsightly con-  
dition. The trees shared the fate of the moving earth, and  
they have been utilised as a stockade to prevent further slip-  
ping. A temporary bridge has also been joined to the existing  
bridge, but much requires to be done before the former amenity  
of the castle environment is restored.

AT Birkenhead on Saturday afternoon the effective and  
spacious drill hall, which has been erected in Grange Road  
West for the accommodation of the 1st V. B. the Cheshire  
Regiment, was opened with considerable ceremony. It is built  
of grey stock bricks, with red-faced bricks and stone dressings.  
The site has a frontage to Grange Road West of 168 feet,  
and extends backwards a distance of 240 feet. The axis of the  
drill-hall lies north and south, the front being kept close  
up to the road, so as to leave as large an open space  
as possible at the rear for parade and drill purposes.  
A wide central porch gives access to the drill-hall, which  
measures 153 feet long by 75 feet wide. The floor is paved  
with wood, which is a distinct and most important improve-  
ment upon the stone floor of the old drill-hall. The place will  
be well lighted from the roof by electric arc lamps. On the  
west side of the hall are arranged rooms for commanding  
officer and adjutant (with separate entrances), officers' room,  
cloak and dressing-room, orderly-room, also large recreation-  
rooms, with store and kitchen adjoining. On the east side is

the armoury, lavatory accommodation for men, and cottage for  
permanent staff-sergeant. The hall is almost double the size  
of the old drill-shed in Park Road South, and will permit the  
drilling of a small battalion of five or six hundred men within  
its walls. The place is heated by hot air, and everything has  
been done to make it as comfortable as possible. The build-  
ing has been erected by Mr. Richard Allen, Birkenhead, from  
the design of Messrs. Morter & Dobie, architects, Liverpool.

WHILE a workman employed at St. Thomas's Mill, near  
Stafford, was engaged in digging a grave for a heifer which  
had died he came across two large stone coffins containing  
skeletons, which were lying face downwards, and which were  
in a fairly good state of preservation. Formerly a priory of  
Black Canons existed at the place, it having been built in  
honour of Thomas à Becket, the martyred Archbishop of  
Canterbury. The fabric of the priory has long since disap-  
peared, and only fragments of the ancient building are now  
to be seen. The priory was founded by Richard Peche, Bishop  
of Lichfield, whose remains are said to have been buried there.  
It is conjectured that the place where the stone coffins were  
found, at the rear of the present house, was the priory  
cemetery. The priory was dissolved in the reign of  
Henry VIII, when its gross revenues were estimated at 198*l*.  
per annum. The priory was dismantled and given away by the  
king, and in later years the premises as they now exist have  
been used as a cotton mill and now as a corn mill, power for  
driving the machinery being supplied by water drawn from  
the river Sow. The coffins, which have since been covered  
up, were about 2 feet below the surface of the ground.

THE new Council-house and public offices at Sparkhill, for  
the parish of Yardley, were formally opened on Wednesday.  
The building, including site and equipment, which has been  
erected at a cost of 16,000*l*., adjoins the Sparkhill police station.  
It is in the modern Renaissance style, with the introduc-  
tion of a slight Tudor feeling. It is of brick, with stone  
dressings, stone mullion windows, stone cornices and  
Cotswold stone tiled roof. There is a gable at each end,  
whilst the central portion is relieved by a circular bay  
running up to the roof. At the north end is a well-designed  
clock tower, about 80 feet high, in which, by the generosity of  
Mr. W. H. Barber (who, it will be remembered, was the donor  
of the Queen's statue in Victoria Square, Birmingham), a clock  
has been placed. This links the police station, as it were, with  
the new offices, making one compact block of public buildings.

TELEPHONE 2495 GERRARD.

There are two entrances at the front. One communicates with the main staircase leading to the council chamber, and the other is conveniently adapted for visitors to the surveyor's department. On the ground-floor there are eight well-appointed offices. The rate collectors will be accommodated in two offices. A stone staircase leads to the first floor, and opens on to a long corridor, broken into bays by piers and pannelled ceiling, and running the whole length of the council chamber and committee-rooms. The chamber, which measures 50 feet by 27 feet, has the appearance of a baronial hall. The roof is open-timbered, and the apartment is well lighted by stone mullioned windows and leaded lights facing Stratford Road, and a line of clerestory windows, filled with stained glass, on the opposite side. The thoroughness with which all departments are to be centralised is emphasised by the extensive buildings at the rear of the main block. Entering from Court Road is the dépôt comprising fire station, mortuary, stabling, workshops, mess-room for the firemen, &c. The fire station, the caretaker's house, and all the other buildings are well-appointed and thoroughly equipped. The buildings are heated on the low-pressure system, and by radiants. Provision has been made for electric lighting, but for the present gas will be used.

For these telephones the following advantages are claimed. The telephones being specially constructed will be found to successfully withstand the severe conditions to which they are subjected in feeder pillars; on any one route a number of instruments may be connected to one pair of wires the same pair of wires that allow communication to be made from the feeder pillars may also be used for connecting a station or dépôt to the central station; the batteries being at the central station are readily accessible, and are not so liable to get out of order as on systems where batteries are fitted in the feeder pillars.

A NEW catalogue and price lists have reached us from Berkefeld Filter Company, Oxford Street, to whose improved germproof filter they have given the distinguishing name "The Tubor." Of the great purifying qualities of this extremely simple filter we have had occasion several times to speak.

THE Thornton-Pickard Manufacturing Company, Ltd. announce that their new abridged catalogue is now ready. It contains brief particulars of many novelties which they are introducing for the coming season and a complete list of the reduced prices of shutters.

### NEW CATALOGUES.

THE larger portion of the comprehensive volume issued by the St. Pancras Iron Work Company, Ltd., is devoted to the illustrated description of their well-known stable fittings and appliances, particulars of every variety of which for stable, harness-room, loft or yard, are fully given, including paving, drainage, furniture, heating and ventilation. Although, however, stable fittings have gained for this company a world-wide reputation, they do not by any means exhaust the list of their productions, which embrace most ingenious iron staircases for interior and exterior use, wrought-iron doors and roofs, plain and highly ornamental gates, grilles and balusters, horticultural buildings, porches and awning, pavement-lights, and in fact everything into the manufacture of which iron enters as an element. In all cases the design is skilful, and consequently the approval of many architects has been secured by the St. Pancras Iron Work Company.

THE General Electric Company, Limited, have sent us their illustrated price list of telephones for electric traction

### SOUTHAMPTON DOCKS IMPROVEMENTS.

WORKS of considerable extent, for some time in progress, are now approaching completion at Southampton Docks, to the accommodation of which they will form a large and much needed addition. They are being carried out by Messrs. John Aird & Co., and are destined to be used as cattle wharves and cold storage accommodation. At almost the extreme end of the docks—on the south-west, or Test, quay—a huge building is in course of erection, and is rapidly approaching completion which must be a most important factor in connection with the meat trade of the country in view of the decision of the Board of Agriculture that they are prepared to approve of the establishment of a foreign animals' wharf at Southampton, and that they will issue an order to that effect so soon as arrangements have been made to the satisfaction for landing and slaughtering, &c., foreign animals. This great building will provide an immense amount of accommodation for the cold storage of the carcasses of the animals slaughtered near there on landing. Of somewhat

TELEPHONE 2141.

On the exterior, the building is 400 feet by 120 feet, with a cubic contents of 2,500,000 cubic feet. The whole construction is of Hennebique patent ferro-concrete, and is founded on 1,347 ferro-concrete piles of a length of 100 feet. There are four floors, each of an area of one acre and a quarter, all being calculated to carry a weight of 100 tons, and when completed there will be about 64 cold rooms or chambers arranged on the latest insulating principle for high and low temperature. The height of the rooms is 10 feet and 14 feet respectively in the clear. There is a receiving-room on the roof, 325 feet by 52 feet, where everything will be handled, and surrounding this receiving-room is a water tank for a depth of 3 feet of water to be used for condensing purposes. There are to be four good's electrical lifts, capable of lifting two tons at the rate of 100 feet per minute. Cattle will be kept alive at the lairage, which is to be erected near, and which has been started so far as preparing the ground is concerned, and large vessels will be able to come alongside the quay, where there will be ample depth of water for them. There will be a conveyer from the lairage to the cold storage, by means of two or more electric cranes on the roof and other appliances the carcasses will be speedily distributed to the different cold chambers. The lairage will probably be 400 feet by 150 feet, with the different necessary departments for the ready handling and dealing with the animals landed there. In the engine-house, adjoining the cold store, there is, or will be, four Stern's refrigerating machines, three large Siemens' dynamos of 220 volts, three Worthington pumps and two condensing machines, three of which are Cock & Wilcox's multi-tubular boilers, and Messrs. Men's economiser for surplus gases after passing through the engines; while outside is a brick shaft 100 feet high. Mr. F. Foxlee, M.Inst.C.E., engineer for the South-Western Railway Company, was responsible for the designs, and the great building has been erected by Messrs. John Aird & Co., under the superintendence of Mr. Landrey, their agent at Southampton. On the east side of the docks Messrs. Aird & Co.'s workmen are also busily engaged with pile driving and other appliances for the construction of another unloading jetty for coal, with a full dock inside for barges. This will extend from the existing jetty, northwards, a distance of 350 feet, and it will be, though on similar lines, to the existing one adjoining the property of the Southampton and Itchen Floating Bridge Company, and familiar to the numerous passengers on the

steam-ferry bridges which cross the river Itchen. There will be deep water outside for colliers to lay alongside, and a sufficient depth for barges to lay always inside. The work is well under way, and practically all the piles are driven.

Progress is likewise being made with the new graving dock, which will be on the reclaimed mudlands, running almost parallel with the town quay, on the west side of the docks. The excavations are being got on with, and large quantities of chalk from Micheldever are daily taken into the docks, but it will be some time yet before the work begins to assume practical shape. The operations now in progress must mean a vast expenditure in wages for others than those concerned in different ways with the many vessels coming into and leaving the Docks, and engaged in loading and unloading the same, and when completed should result in great benefit to the town and port.

### HOLY TRINITY CHURCH, NEW BROMPTON.

AN inquiry was held at Chatham on the 10th inst. by Mr Alfred Hands, F.R.Met.Soc., in reference to a claim by the churchwardens of Holy Trinity Church, New Brompton, against the insurance company for damage alleged to have been caused to the spire of that church by lightning on some date unknown. Some stones having fallen in July last an examination was made, and cracks being found of such a nature as to render immediate repairs necessary, the work was carried out and compensation was claimed under the fire policy, which, as usual, contained a clause including lightning risks. The company having disputed the claim, Mr. Hands was appointed arbitrator, and after hearing expert evidence on both sides, and examining the broken stones which had been preserved for the purpose of the inquiry, decided that the damage was not caused by lightning, but was due entirely to the rusting of the vane-rod which passed through the stones, and therefore that the insurance company was not liable.

### DURBAN TOWN HALL.

At the last meeting of the Durban Town Council, Mr. F. Masey, architect, Cape Town, wrote with reference to the decision of the Council to invite designs for the new town hall in England. He was sure that this course would end in dis-

appointment and spell disaster to all concerned. The conditions and limitations with respect to material and labour which existed in the colony were so tyrannical that it would be absolutely a practical impossibility for an architect to design a building which would conform to such conditions without possessing such intimate and practical knowledge as could only be obtained in South Africa. There were in England a large number of clever draughtsmen turned out by the art schools who would eagerly embrace an opportunity for an architectural gamble of this description. The conditions would attract a crowd of designs cleverly drawn and coloured, and which, although possessing no practical merit by so brilliant draughtsmen, would divert awards from painstaking and more experienced South African architects.

The Deputy Mayor said that Mr. Masey himself was not a competitor. He thought that there was a great deal in what Mr. Masey advanced.

Mr. Ellis Brown said that local architects had spoken to him on this matter, and they remarked that they would be glad to compete with architects from home. This was a piece of work that would be something new for the local architects. It was only right that designs should be asked for at home and comparisons got from people who had experience in buildings of this description.

Mr. Pickering moved that the letter be received.

Mr. Ellis Brown seconded, and the report was adopted.

### THE REEVE COLLECTION FOR THE BRITISH MUSEUM.

THE British Museum has now had in its possession close on three weeks its selection from Mr. James Reeve's collection of works in water-colour by representatives of the Norwich School. With these, says the *Norwich Mercury*, is a unique collection of letters, catalogues, price-lists and criticisms in the newspapers when the Norwich artists held their annual exhibitions in the city, which will enable the art world—professional and amateur—to estimate more accurately the value of that early school of which they have heard much, but have been able to learn but little by reason of the lack of genuine work and accurate knowledge available in London.

"Old" Crome, the father of the Norwich School, more than

holds his own among the landscape painters in the National Gallery. Some critics claim for his "Mousehold Heath" it has no superior in the national collection. A very few comparatively minor examples of work in water-colour can be seen in the British Museum and the South Kensington collections. His art companions in Norwich, of whom John Sell Cotman ranks first, both in water-colours and in black and white drawing, have in comparatively recent times been also recognised as artists whom it is as necessary to know intimately. John Sell Cotman has, in fact, now fairly won his place among the few great workers in water-colour. The nation which has a fine illustrative collection of such work by Turner, and has been accumulating examples of the other most famous early English workers in water-colour—De Wint, Girtin and David Colnaghi, has, however, till now had little to show that did any approaching justice to John Sell Cotman, their friend and fellow artist from the beginning of the nineteenth century. Those who had come to Norwich in the summer of 1897 to see the fine collection, then worthily displayed by the Norwich Art Circle, realised that here was a man who, as Mr. Fred Wedmore put it, "Through good reason and evil report an artist only," while "the heavens so willed it that his work—so sterling, so sober, so pure—should evade popularity." What Norwich had displayed to a smaller but not the less typical display in London. The *Architect* was permitted by Mr. Reeve to reproduce a photo-process, a selection from his exhibits, and the reproductions, in sepia tint, were so attractive that there was a demand for an issue on plate paper. This wider, fuller knowledge of John Sell Cotman was accompanied, in the *Architect*, by a well-written appreciation of the work of an artist. Thus, without any effort on the part of the Norwich or Norfolk man, the art-world came to feel that the nation could no longer afford to be without a recognition of John Sell Cotman's style, characteristics, and modes of working. It may be concluded that the knowledge which Mr. James Reeve enthusiastically gave in the preparation of the Art Circle catalogue, and especially his accurate records of Cotman's labours and of the want of recognition at the time by his own townsmen, led to his being put into communication with water-colour lovers in all parts, as the Norwich man who knew details. Hence followed many visits to the city to see his collection and that at Carrow Abbey, where these have made well known in the United Kingdom and

Office: Imperial Buildings, Ludgate Circus.

United States the wealth of John Sell Cotman's genuine work which was yet available in the city.

Soon after Mr. Laurence Binyon, of the British Museum, had written, for the *Portfolio* of April 1897, his admirable monograph on John Crome and John Sell Cotman, it became known to a few of the citizens that the British Museum authorities in charge of the print rooms, where is a wonderful gathering together of art work, as evidenced by drawings, engravings and engravings, had expressed their desire to acquire Mr. Reeve's collection. He recognised the spirit which led to this desire, and after a time intimated his willingness to dispose of the whole, and that at a price which fell far short of the sum that would willingly be given by an American millionaire, or that would be realised at Messrs. Christie's, if the collection were broken up for purposes of sale. The Museum authorities naturally enough wanted to have so complete a record of the artist's work as Mr. Reeve offered. He believed, however, the heads of the Museum found that money was just then not available. But the matter was not upon dropped. Certain works were sent up for inspection by the Trustees, and as the result the larger part of the Reeve collection is now at the British Museum, where probably for long the world will be invited to inspect this new bit of the nation's wealth.

This collection, illustrative, as it is, of John Sell Cotman, includes among the more famous water-colours "Greta Bridge," "The Draining Mill, Lincolnshire," "The Wold Coat," "Norwich Cathedral," "Mousehold Heath," most of the Normandy and Welsh drawings. Then there are his many beautiful compositions in chalk and water-colour, some of which have been photo-processed, and have thus helped to make Cotman his later renown. In all there are scores of drawings and etchings. Added to these is the unique collection of photographs, letters and other documents, which will enable one to write a good story of the Norwich School.

Mr. Reeve had, as is well known, excellent works by other artists of the school. Most of these are works scarcely known in London. The two Girtins of Yarmouth, Miles E. Cotman, John Cotman, Ninham, Lound and Thirtle are thus now to be fully represented, while there are also half a dozen prime works of the late Mr. J. W. Walker also included.

Mr. Reeve retains the well-known "Twickenham," the interior of Trentham Church, "Byland Abbey," and that curious study in colour which Cotman dedicated to Sir Henry Englefield—"The Presentation of the Rose and Sword

to the Lady of the Manor of Flixton"; besides the water-colour of the Italian composition which in oils is the fine painting at Carrow Abbey, commonly spoken of as "The Falls of Tivoli," and various other interesting works—"Postwick Grove," "On the Greta, Clifton," two of the Normandy drawings, and one of the Welsh series. It will be seen that there is yet, when the opportunity is afforded, good material available here in Norwich for the lover of John Sell Cotman to study him, at Mr. Reeve's, as also at Carrow Abbey, at the Castle Museum, and at the dwellings of some of the citizens. The nation, however, it is well to know, has put beyond all hazard such a selection of work by the Norwich School as was desirable, seeing how ready wealthy America is to buy of the best that the old land has produced.

### AN AMERICAN WAREHOUSE.

A 166 BY 62 feet five-storey and basement slow-burning warehouse building at the corner of Gay and Front Streets, Columbus, Ohio, was designed by Mr. Frank L. Packard to meet the special requirements of the Eldridge & Higgins Company, wholesale grocers and jobbers, to whom the building has been leased for a long term. As the owner wished a building of exceptional durability the structure contains many interesting features.

The footings of the walls and columns, says the *Engineering Record*, are carried down through gravel and quicksand to solid blue clay, and so much water was encountered that the construction of the foundations was difficult. Atlas Portland cement concrete, made 1 : 2 : 5, was mixed in a rotary machine and poured, with a fall of 10 feet, into the trenches and spread there in 1-foot layers, which were allowed to set under water. Large flat-bed limestone blocks 10 inches thick were laid on top of the concrete footings and the brick walls, from 25 to 30 inches thick at the bottom, were started on them. All masonry to a height of 1 foot above the basement floor is of vitrified paving brick  $3\frac{1}{2}$  inches thick,  $4\frac{1}{2}$  inches wide and 9 inches long, which will not absorb more than 2 per cent. of water and are laid header and stretcher, Flemish bond, with  $\frac{3}{4}$ -inch joints. The upper parts of the walls are offset to reduced thicknesses and are faced with paving brick and backed with wire-cut tunnel brick, all laid in 1 : 2 Portland cement mortar.

The walls are self-supporting, and, with two longitudinal

rows of interior columns, carry the floors and roof. The columns are  $12\frac{1}{2}$  feet apart, in rows 20 feet apart, and about 20 feet from the side walls on centres. They have offset concrete footings  $7\frac{1}{2}$  feet square, with 4 by 4-foot brick piers, which directly carry the first-floor girders. As the street grade slopes down 7 feet from front to rear on the long side of the building, and the basement is made with a level floor throughout, it is over 14 feet high in front, under the office rooms, which are  $13\frac{1}{2}$  feet high to the top of the second-floor beams. In the rear part of the building the first floor is 5 feet below that of the offices, making the basement ceiling there correspondingly lower. In the rear of the basement the column piers are 7 feet high, with one stone bonding course and a cap stone; in the front part they are 12 feet high, with three stone bonding courses and stone caps.

The columns are made in five sections each, reducing in size from the bottom upwards, and have projecting flanged cast-iron caps supporting the floor girders at every storey. In the first storey the columns are 16 by 16 inches, in the second 12 by 12, in the third 10 by 10, in the fourth 8 by 8, and in the fifth 6 by 6 inches. The ends of the columns are seated on the webs of the cast-iron caps, which project beyond them far enough to receive the longitudinal floor girders, which are 16 by 16 inches for the second floor, 14 by 16 for the third floor, 12 by 14 for the fourth and fifth floors, and 6 by 14 for the roof. The first-floor girders, resting on the piers, have clear spans of only  $8\frac{1}{2}$  feet and are 14 by 16 inch-beams. The transverse beams are 10 by 14-inch for the first and third floors, 12 by 14 for the second floor, 6 by 14 for the fourth and fifth floors, and 4 by 14 for the roof. They are spaced about 3 feet apart on centres, and are carried on top of the girders, to which they are anchored by angles spiked to the tops of the girders, with their vertical flanges engaging notches cut across the bottoms of the beams.

The outer ends of the roof beams rest on the tops of the walls; all other beams supported by the brickwork are carried in iron stirrups. Where the longitudinal girders are supported by the brick walls they are encased in Goetz-Mitchell wall boxes, and where they are supported by lintels they are hung in stirrups. All exposed beams and girders in the office portion of the building are dressed and shellaced, and as soon as set were wrapped with heavy building paper and had boards nailed on top projecting  $\frac{1}{2}$  inch past the edges to protect them during the construction of the building.

As soon as the brickwork was finished the 2 by 4-inch

matched roof sheeting was laid, and then the sub-floors laid with diagonal  $\frac{3}{4}$  by  $2\frac{1}{2}$ -inch oak strips laid on edge spiked together every foot. On top of this was laid asbestosea-grass quilting and then  $\frac{3}{4}$  by  $2\frac{1}{2}$ -inch finished tongue-and-groove beech flooring, matched sides and ends, laid longitudinally and secretly nailed to the sub-flooring. The basement floor was levelled and covered with a thin, tamped cold-dry cinders, on which was laid 4 inches of 1 : 2 : 5 Atlas Portland cement concrete, finished, before it had thoroughly set, with an inch of 1 : 1 cement mortar, trowelled and graded cesspools.

The roof sheathing is covered with one thickness of ne resin-coated building paper and four thicknesses of 50-pound wool roofing felt, mopped solid between laps with Eagle brand asphalt cement, then flooded with 125 pounds of the same cement to each square of the roof and sprinkled while hot, with clean-washed gravel. The roofing paper felt were flashed 12 inches up the walls, cemented to the brickwork with asphalt, and counter-flashed with No. 26 gauge galvanised iron let  $\frac{3}{4}$  inch into the brick joint, secured with metallic plugs and pointed with cement mortar. The roof was made with a guarantee to be storm-proof for ten years.

In one corner of the building, adjacent to a stair-well, there is in every storey a brick vault and a fireproof room, 18 by 34 feet inside. These rooms are used for the storage of sy matches, tobacco and fruits. They have brick walls and brick arch floors grouted, keyed with slate and supported by 12-inch transverse I-beams 4 feet apart. The floors are concrete and asphalted and the rooms have automatic fireproof doors.

The jambs of all doorways are faced 7 feet high with  $\frac{1}{4}$ -boiler iron rivetted to angles, and the windows which are exposed to other buildings have metal frames glazed with glass. Kinnear steel rolling doors are used for the shipping room and elevator shaft. The doors to the fireproof room and to all stairways are made with a well braced  $2\frac{1}{4}$  by 6-foot wooden frame covered with 3-16 inch asbestos cardboard tacked in place and sheathed with No. 22 gauge galvanised iron, with double interlocking joints covering all nail heads. They are hung on rollers on overhead tracks, inclined so as to keep the doors always closed.

Stock is carried down from the upper storeys to the first storey shipping-room and thence to the basement on 45-degree chutes with reversed curves at the bottom, which enable the goods to be handled rapidly for outgoing orders. Where the ch

through the floors the openings are provided with fireproof doors held open by fusible links which, in case of fire, melt and allow the doors to close by gravity. Should any storey be flooded with water the chute would carry it off and save the goods on the lower floors from damage by it. The two Otis elevators have a carrying capacity of 2,000 lbs. each, a speed of 100 feet per minute, and are enclosed in brick walls with fireproof doors and Richmond safety gates.

The offices are finished in white oak, and are plastered and heated; the broken package room on the third floor is the other part of the building which is heated, and no other parts are plastered. The capacities per square foot of distributed load on the different floors are as follows:—First, 100 lbs.; second, 450 lbs.; third, fourth and fifth, 250 lbs. each, with a factor of safety of four, and the columns calculated to carry the same full loads on all floors simultaneously.

The hot-water heating system in the basement is guaranteed to maintain a temperature of 70 degs. when the outside temperature is 10 degs. below zero. The plumbing includes a floor iron sink, men's and women's toilet-rooms and a separate office toilet-room on the office floor. The sink and all basins are supplied with hot water furnished by a Rundell boiler in the basement, which is operated by gas. The elevators are run by electricity, with which, as well as by gas, the building is lighted. Switches and fuse block controlling lights on each floor are set on slate backs in asbestos-lined wooden cabinets at the heads of the stairs in each storey. There is a system of ventilating flues connected with electric fans discharging above the roof.

The total cost of the building was about 85,000 dols., and when it was inspected by the Ohio building inspector for the record of Underwriters it was pronounced the best fire risk for a class of building which they had ever taken, and the minimum rate was allowed for the insurance premium.

## THE FRONTAGE LINE IN NEW YORK.

Experienced architects will be interested in the story of a portico in front of the Pabst Hotel, at the corner of Broadway and Forty-second Street, New York, which was cut out over the sidewalk in front of the hotel some years ago, which its owners have now, says the *American Architect*, by decree of the Supreme Court, been ordered to take down

and remove at their own expense on the petition of the city authorities. It was proved by the defence, and admitted by the representatives of the city, that other buildings in the neighbourhood projected over the sidewalk, but the Court naturally declined to consider this fact a justification for the acts of the defendants. As a matter of fact, however, a very large number of buildings in all parts of New York have projections of some sort extending into the public street, and the history of these projections would form a very curious chapter in the account of municipal government in the metropolis. In most parts of the city there are really two street lines, one known as the house line, beyond which the main front walls of buildings can extend only by special permission of the City Council, and the other, parallel with the first and about 5 feet from it, called the area line. Owners may construct within the space comprised between the house line and the area line the basement entrances which, in New York, are almost always in front of the house, and in the mercantile districts this privilege usually includes the maintenance of sidewalk elevators in the area space. On the streets in the newer parts of the city, where high basements prevail, a third line is usually recognised, known as the "stoop line," which is laid out 2 or 3 feet, or sometimes more, beyond the area line, so that the flights of stone steps leading to the front door, extending to the "stoop line," may give room under them for a convenient basement entrance, reached from the area space. Although architects in New York have always been obliged to consider in their plans the exact location of these various lines, the restrictions implied by them have been made known to the general public mainly by the controversies incident to their violation. It used to be said, we do not know with how much truth, that the front steps of the great majority of the houses on the principal "up-town" streets projected a foot or more beyond the "stoop line," and that the city officials, after winking at this infraction of the law, derived a handsome income from changing their minds, and giving at intervals to the owners a hint that nothing but a substantial sum in cash would prevent them from making a complaint, the result of which would be an order requiring the removal of all steps projecting over the line. As the art of domestic architecture advanced in the city, the inducements for a liberal construction of the restrictions were multiplied. At one time, a fashion set in for copying the Boston device of "swell fronts," and polygonal projections the whole height of the house began, at first timidly, but afterwards more boldly to advance into the area

## A SPLENDID RECORD.

### Two Great Newspapers.

Recently the owner of a foundry saved by the May-Oatway Fire Alarm wrote:—"It is the best," and now the *New Zealand Star*, referring to a big gas explosion in its own premises, says:—"A satisfactory feature is the test it gave to the efficiency of the May-Oatway Fire Alarm apparatus. Though only a little heat was generated the apparatus promptly signalled the alarm, and the fire brigade arrived." The *Otago Daily Times*, whose premises are also protected by this system, in referring to the *Star* explosion, says:—"It would thus appear that the May-Oatway Alarm is as efficacious in the case of an explosion as it has already proved itself to be on an outbreak of fire." This confirmation of its high reputation gave great satisfaction to the Brigade and Insurance authorities, the two great organisations of which have unanimously recommended this system.

space. The "stoop," too, which at first meant simply a flight of steps such as the people of Amsterdam and those of the older portions of Philadelphia and New York still find such delight in scrubbing, was assumed to include also some sort of shelter at the top, in the form of an iron porch, or of the richly-carved brown-stone porticos which still lend dignity to the mansions of Fifth Avenue. As this innovation was received without opposition, the "stoop" portico ventured farther, sometimes extending to the limit intended for steps alone. Naturally, such obvious violations of the intent of the law attracted attention, but, by keeping on good terms with the officials, no harm usually came of them beyond an occasional unimportant fine. In the mercantile districts, where sidewalk room was scanty, the construction of "porticos" was more hazardous; but even there a night or two of rapid work, favoured by the amiable absence on important duty of the patrolmen from that portion of their beat, would generally put the structure beyond the reach of injunctions from neighbouring owners. In this way and in others a large number of technical obstructions and nuisances have been created in New York, which will form one of the most difficult subjects with which an honest administration will have to deal. To allow them by formal permission to stand as they are will be to condone in most cases impudent violations of the law, while to order their removal will be to cause a very large amount of annoyance and expense to people who in most cases are quite innocent of any complicity in the original misdemeanour; and the third alternative of leaving things as they are would be the worst of all, as it would afford the politicians of the defeated party an opportunity for extracting from people afraid of the enforcement of the law a large campaign fund, as well as influential support, by promises of immunity in case of their success two years hence.

### THE TRAINING OF WORKMEN.

THE annual meeting of the Manchester Association of Engineers was held in the Grand Hotel, Manchester, on Saturday, Mr. E. G. Constantine, president, in the chair. From the annual report it appeared that the number of members on the roll was 500, as against 470 in the previous year. The balance standing to the credit of the Association after payment of all accounts amounted to 5,102 $\frac{1}{2}$ ., and showed a surplus on the year's working of 312 $\frac{1}{2}$ ..

In his presidential address the Chairman said that by no means admitting that England had lost her supremacy as engineering producers, as was too glibly asserted, there was no denying the fact that the methods of working would have to be looked to. Many reasons had been put forward to account for the ability of our trade rivals to compete so fully with us in the production of locomotives, electrical appliances, bridgework, &c. Amongst these were natural advantages in procuring ores and fuels, lower rates of protective tariffs, the fostering of export trade at the expense of the domestic consumer, better commercial and technical organisation, more highly educated workmen, greater attention to workshop arrangement, the use of superior tools, and the working of longer hours. The countries in the western hemisphere which had benefited to the greatest extent by the introduction of British skill and brains, and which were now our severe competitors, were peopled by men possessing the characteristics of pluck, energy, perseverance and tenacity of qualities stimulated in their case by the necessity of providing work and outlets for rapidly increasing populations, and by a pronounced success already resulting from their enterprise. Among the factors essential to successful manufacture it was more potent than the quality of the labour employed, it was to the workmen that we must chiefly look to answer the question of whether Britain was to maintain her position on the ground or sink to a second place as a producer of engineering work. Capital, commercial acumen, scientific and technical staffs, mechanical genius, the ingenious and expensive machines, although highly important elements, were all powerless without the workman, and it was he who principally controlled our future destiny as a manufacturing nation. Employers were themselves to blame for the shortcomings of the workmen, for had they taken a proper view of their responsibilities and displayed a greater interest in the welfare of their men, the gulf which existed between capital and labour would have been less wide. An alteration of the unsatisfactory conditions existing between employers and employes could only be effected by employers more recognising that greater attention must be paid to the training of workmen, and that the haphazard fashion of leaving them to grow up anyhow must be abandoned. To enable us to hold our own in the world's progress it was essential to seriously grapple with this problem of skilled labour, for the measure of our future prosperity would be directly proportionate to the thought and care expended in the selection and training of

entice. No boy should be allowed to start work before  
ained as to his educational attainments and his general  
ss for the trade. With the educational facilities within the  
n of even the poorest there was no excuse for ignorance,  
any lad who through indolence or lack of brains or appli-  
n had failed to acquire a fair educational groundwork was  
outside an engineering works. In his opinion boys should  
commence work till they were about sixteen years of age.  
re-years' apprenticeship under proper conditions would then  
ng enough to enable an intelligent and industrious lad to  
how to become a good workman. The technical educa-  
of an apprentice should begin the day he entered the work-  
It could not be too strongly emphasised that technical  
ation was not merely the learning to be obtained outside the  
shop, but it included the extremely important training of the  
d and eye, the development of the sense of proportion, and  
those qualities of self-reliance, pluck and determination to  
ount difficulties, the offspring of constant attempts,  
res and successes, which it was almost impossible to  
ire except from practical work, and without which the  
men and those who had to deal with practical engineering  
at a terrible disadvantage. The danger that education  
better training of apprentices would unfit them to become  
men was imaginary. Sound education never yet spoiled  
made any one lazy; it was the little learning which was  
gerous. With an extension as to commencing age and  
er conditions of work, there need be no apprehension of a  
th of well-educated boys eager to work and learn; as it  
progressive firms had vacancies bespoken, in some instances  
y months ahead. He thought that if some enlightened policy of  
ing young workmen, and dealing in a fair-minded spirit with  
n when they became journeymen, were adopted we should  
see important results. Amongst them were the following:—  
great majority of workmen would be thoroughly efficient,  
put forth their best mental and physical efforts; we should  
free trade in labour, the abolition of vexatious restrictions  
e conduct of workshops, increased production at reduced  
although on higher wages, stimulus to invention, trade  
ns fulfilling their legitimate function of looking after their  
bers' best interests by co-operating with employers for the  
fit of all, the exclusion as far as possible of other than  
petent and industrious workmen, the settlement of labour  
tions without the disastrous consequences inseparable from  
most barbarous of all methods, strikes, and the ability of  
country to hold her own against all comers. These were

only some of the results which would accrue from a whole-  
hearted effort to train our workmen better; whilst the general  
effects would be incalculable, by no means the least being the  
elevation of the national character.

### THE HOUSING PROBLEM.

In a letter to the *Glasgow Herald* Professor Smart writes:—  
On the housing question everybody is agreed that "something  
must be done." In the present temper of the municipality it is  
evident that something will be done. Meanwhile no one is quite  
convinced as to what should be done. The crowded and  
representative audience last night at the Civic Society—a rare  
phenomenon at an adjourned meeting—shows that the citizens  
are at last roused to the urgency of the problem. The discus-  
sion, however, only accentuated the feeling that what we  
need is more discussion, not the endless wrangling where  
people try to score off one another, but systematic, continuous,  
round-table discussion. There is, I believe, only one way  
in which we can get this.

I am one of those perhaps exceptional persons who believe  
in Royal Commissions. The evidence laid before such bodies  
is the chief store-house from which I get the materials of my  
teaching. I have, accordingly, in my time read many of these  
great blue-books, which are so unattractive outside and such  
fascinating reading inside; and I say, without hesitation, that  
when a Royal Commission devotes itself to the investigation of  
any subject, if the commissioners and the witnesses are well  
chosen, there is scarcely one aspect of fact connected with the  
subject but is illumined and scarcely one point of theory but is  
tested. Nothing escapes the search-light thrown by a dozen  
cross-examiners of different interests. Anyone who looks back  
on the industrial commissions of the last few years knows that  
a Royal Commission has sounded the knell of many a fad.

Why, sir, should we leave this most valuable instrument of  
investigation to the central Government when a municipality  
is such a great part of the total government? Why should  
we not have a Municipal Commission, with a remit from the  
town council, to consider the question of housing in our own  
city?

This is not a proper subject for a Parliamentary inquiry.  
Every growing town has a housing problem—if it had not it  
would not be a growing town; but in many towns the problem  
is so complicated by circumstances peculiar to themselves that

a general investigation into housing would require another special investigation to supplement it. As we get more light on our own problem it is seen to be so peculiar and so difficult that what we want is to concentrate our investigation on Glasgow.

The idea of a Municipal Commission is, I think, a new one. We had something like it before in the Presbytery of Glasgow Commission of 1891, on which I had the honour of serving. Edinburgh has, I think, had commissions of joint-boards on several subjects, and no one doubts the value of the work done by them. But we want something larger and something more authoritative now. What draws out the best expert evidence on a Royal Commission is the knowledge that the work and thought of the witnesses will not be wasted, but applied to the public use; every conscientious man who has something to say on the matter takes it as an honour to be asked to appear before it, and considers it a public duty to give it of his best. And to be a commissioner carries no small honour with it. Am I wrong in thinking that a Commission, instituted by the great Municipality of Glasgow, and dealing with a problem peculiarly its own, would carry as much weight as any Royal Commission?

If I am asked whether, after all these months of discussion, we are likely to get any new light on the subject, I say unhesitatingly yes, and particularly in one direction. No one is yet able to explain satisfactorily the failure of private enterprise in Glasgow to provide a needed article. It is in despair of private supply that the Corporation is almost being forced to build, although anyone who considers the figures must see that all the Corporation can do will give only the merest fraction of the necessary supply. But even if such a Commission gave no new light, what it would certainly do is to concentrate the light we have. It would at least bring together and make accessible the facts which even I—whose business it is—possess only in newspaper cuttings, pamphlets and records of private conversations, and it would put before the citizens those theories of municipal action and expenditure which alone can draw practical conclusions from the facts. To despair of a great Commission recommending some solution is to despair of human reason.

The Commission, however, should not be rashly undertaken, or undertaken by people who will not accept it as for the time being the work of their life. A great deal will depend on the commissioners, for in their hands is the guidance of the evidence led. They should be picked men, of

various interests and various classes, so that no aspect of the question is kept in the background, and they should be intellectually honest men, who will give their final report in the matter of public conscience and public duty. At the head of the Commission should be some statesman—not necessarily belonging to the city; indeed, preferably not belonging to the city—whose very name would be a guarantee of fairness and impartiality. The ideal chairman for such a Commission I am pretty sure, suggest itself to everyone. A very great deal also will depend on the terms of the remit. It is too often the case that Commissions find themselves vexatiously and necessarily hampered by the terms of their remit, and its working should accordingly be the subject of the most anxious thought.

As to the expense, let me say at once that it will be considerable. Printing is a very large item in all Commission. A good-paid secretary is indispensable; probably two or three paid special commissioners would be required to make special reports on other cities. One special feature should be introduced by the Local Taxation Commission, of getting memoranda from economic and financial experts in answer to a list of questions scheduled, but this would not cost much. I am not sure that the Council should be asked to bear all the expense. It is certainly a municipal matter, but the expense should not be allowed to provoke the hostility of those who conscientiously believe that the Corporation has already all the light it needs. This, however, need not stand in the way. I have such faith in the necessity of such a Commission and such confidence that the citizens are in earnest on the matter, that I should gladly burden myself with the duty of securing an ample guarantee fund.

This proposal is, I think, as much in the interests of the ruling body as in the interests of the citizens. It is, unhappily true that all the guidance we give in most municipal matters is to vote—when we do vote—for a representative to leave him to think for us, and then grumble at the bill. For this reason that conscientious councillors, becoming convinced from the special knowledge they acquire in the Council of the necessity of some particular measure, are apt to keep as quiet as possible till the measure is fairly entered on. If this Commission were finally to report on any scheme, however large and expensive, I venture to think that the Corporation would be able to do what it seldom has the pleasure of doing—carrying out a mandate endorsed most amply by ratepayers.

## THE WEEK.

THE terrible accident in Belfast which occurred on Monday must create doubts about the sufficiency of the new Factory and Workshop Act. A day or two after it came into operation we endeavoured to point out its weakness. We explained that practically what was mainly required was whitewashing with appliances for ventilation and drainage. The part of the Act relating to safety comprised only the fencing of machinery, occasional examination of steam boilers, the position of self-acting machines, the cleaning of machinery when in motion, and provision of means of escape in case of fire, but whether the factory or workshop was of adequate strength the framers of the Act did not think it necessary to determine. Now everybody who is acquainted with factories is aware that additions are made to the machinery, or new machinery is introduced without the least regard as to whether the floor is capable of sustaining an increased load. In saying this we do not wish to anticipate the conclusions which will be arrived at in connection with the investigation of the Belfast case. We speak of factories in general, which it is notorious do not come under the eyes of men who are skilled in determining the strength of floors, columns and walls. No doubt the factory owners as a body possess great influence, and they are opposed to periodical examinations by officials who are skilled in construction. But, regardless of interests of the kind, the Government should insist on regulations which would prevent collapses in the whitened sepulchres which become equivalent to earthquakes on a small scale.

THE following roundabout resolution was adopted at the meeting of the London County Council on Tuesday last:—"That, in consequence of the growing evil, resulting in loss of life and injuries to persons, damage to business and danger and delay to vehicular traffic, caused by the frequent and continuous opening of roads, it be referred to the highways committee to consider and report as to the best means for the Council to procure such statutory powers as to secure that all persons or companies having Parliamentary powers to open the roads shall be compelled to give adequate notice to the Council before exercising such powers, and that the Council shall have the power to make such regulations and have such supervision as will insure such work being done expeditiously and with full regard to the public safety and business interests." If the obnoxious interference with the traffic of London could have been prevented by the passing of a resolution and some exertion on the part of the highways committee, it is culpable that so long a delay has taken place. We are glad to see the County Council showing signs of repentance for so long neglecting some of their duties. But the gas and water companies have to be reckoned with, and they are sure to plead that an evil which has long been tolerated, if not approved, by the County Council cannot be of much magnitude.

M. BOUGUEREAU has again been elected as President of the Society of French Artists. The sub-committee for architecture consists of MM. NORMAND and BÆSWILLWALD. There have been also officers appointed as usual for the other sections. To outward appearance, therefore, the Society is following its regular course, but it is well known that grave disunions exist among the members. France is Republican, in theory at least, but nowhere is equality more insisted on than in the Society of French Artists. Although it is manifest to outsiders that there are varieties of skill, and that visitors to the Salon make no secret of their preference for certain artists, all this does not affect the opinion of the humblest sociétaire. Committees are chosen by the general body, and it matters not what changes may be made, it is found that year after year there is a tendency to prefer attractive to unattractive works. The committee, in fact, in virtue of their office become showmen, and endeavour to get together a collection of pictures which will bring paying crowds to the galleries. That arrangement cannot be accomplished without the rejection of a great many works. The authors

of them are disappointed, and they find many sympathisers. "It's heavy odds against the gods when they are matched with myrmidons," says BÉRANGER, and the majority of the Society are now in conflict with the committee. They wish to reclaim the power entrusted to their representatives and to exercise it. They assume that by weakening the authority of the committee the general body would gain in strength; but this can only be done by a revision of the whole body of statutes which form the constitution of the Society. At the last distribution of the honours obtained at the Salon, the Minister of Fine Arts said it was the duty of the committee to discourage false vocations. The committee appear to have taken the words to heart, and in consequence have created a host of enemies among their fellow artists by admitting only 1,600 paintings instead of 2,500.

IT is satisfactory to learn that the Court of Appeal has confirmed the judgment already given that a building owner is responsible for the payment of provisional sums for work performed by special artists or tradesmen, or for other works or fittings to the building whenever the architect shall so direct. Building owners sometimes imagine that when a tender is accepted they have no liabilities except to the contractor, and in such cases it is difficult to explain to them that there are sub-contractors who have also claims, the payment of which does not necessarily increase the total amount they had undertaken to pay. In the case in question, *HOBBS v. TURNER*, the contract form of the Institute of British Architects was employed. Clause 28, relating to the payment of provisional sums, was therefore accepted by both parties. It was mentioned in the specification that railings of the value of 20%, exclusive of carriage, fixing and profit, were to be provided for, and they were supplied by the plaintiff. A certificate certifying that plaintiff was entitled to 27% 10s. was sent to the defendant, the building owner, by the architect. The defendant declined to pay, repudiating his liability, and alleging that he had a claim against the builder for bad work. The Master of the Rolls interpreted clause 28 as meaning that the building owner and not the builder should be considered as the principal in regard to it. In such matters the builder was only the agent of the building owner. But his Lordship declined to decide whether under clause 28 the architect had authority to determine who was to pay, as well as to whom payment should be made. Apparently it was the intention of those who drew up the form of contract that the architect was to have the power of choice, for the sums are to be paid at such times and in such amounts as the architect shall direct, and sums so expended shall be payable by the contractor or by the employer. The only directing power is the architect, and it is not suggested that it is optional on the part of the employer to pay or decline to pay. It is to be regretted that the Court was not more decisive in dealing with this part of the question, although it may hereafter be accepted that the initial liability in respect of this class of work was established.

THE Saxon city of Meissen is believed to date from the beginning of the tenth century, when a bishopric was founded by OTHO I. The cathedral has been long accepted as an excellent example of German Gothic. The open work of the spire was at one time much admired. The original building was almost annihilated at the beginning of the thirteenth century, and the existing cathedral was commenced on the site about 1372. The works lasted about a century. In 1547 two of the towers were destroyed and no effort was made to restore them. The condition of the building caused much dissatisfaction. A society was formed to raise funds for completing the building, and over 40,000*l.* have been collected. The question next arose what plans were to be followed. A competition was arranged, and during the past five years there has been much discussion about the design that was best suited. Herr SCHÄFFER, of Karlsruhe, who was entrusted with the restoration of Heidelberg Castle, prepared a design in which two towers were shown. Herr LINNEMANN, of Frankfurt, introduced three towers in his design, and it was by many considered the more picturesque. In the most generous and self-sacrificing manner he gave the preference to the design of his rival, and it has been decided by the society that Herr SCHÄFFER is to carry out the restoration.

## RIVER PURIFICATION AND WATER-SUPPLY.

WHEN JAMES BRINDLEY was asked by the Parliamentary committee for what objects rivers were created, he is said to have replied, "to feed navigable canals." It has been doubted whether the words were correctly reported, but they were characteristic of the rough and ready creator of the Bridgewater Canal. Unfortunately, they express the general opinion in England concerning rivers. Individuals as well as corporate bodies are constantly striving to employ them for particular interests, and regardless of the detriment which may be caused to others. The long time which was allowed to elapse before any restrictive measures against the monopoly were adopted by Parliament also indicates the inability to realise that the rivers throughout the country form a possession which could be utilised for other than local objects. It cannot be said we have yet attained the power of considering the watercourses of Great Britain in their importance to the nation, and on that account various public conferences have been held during late years, the last being one in October, which was organised by the Sanitary Institute. A report has appeared in the "Transactions."

The first paper read was by Mr. J. PARRY, and treated of "The Protection of Watersheds." It was explained that the Legislature's interest in rivers dates from 1847. The Health of Towns Commission had revealed the deficiencies of water-supply in this country. New works were constructed, but they were of little avail so long as the supplies could be contaminated. It became necessary to enact that whoever might cause water to become less pure was liable to be fined. But the landowners were able to prevent the application of the clauses, and for a long time the Act was inoperative. The comparative failure of the attempt was taken as a warning, for "since 1847 there has been no general legislation for the protection of the gathering grounds of waterworks as distinguished from other watersheds." The Rivers Pollution Act of 1876 is not sufficiently effective. The only way in which fouling of water can be prevented now appears to be by compulsory purchase of the watersheds by local authorities. Manchester succeeded in acquiring the area drained by Thirlmere, "but the amount paid as compensation was so excessive as to seriously alarm and discourage intending purchasers." In America it is not required to pay large sums of money for protecting water for domestic use. Regulations are made which are so comprehensive as to make a water-supply be guarded as if it were sacred; but it is doubtful whether we are likely to attain to a state of public opinion which will make purchase unnecessary.

There are other sources of supply besides rivers and streams. A paper on "The Protection of Underground Sources of Water-Supply" was read by Dr. E. C. SEATON. He also bewailed the absence of a central authority to watch over the interests of local communities. In the county of Surrey much has been done to secure an equitable arrangement. The Sutton district, for example, seemed likely to be deprived of much of its water-supply, for a deep well was proposed to be constructed in order to have the water conveyed to another county. Then there is the risk of the contamination of underground sources. The instances at Maidstone and Worthing are sufficient to show what dangers can arise when the water is not properly filtered. Dr. SEATON is of opinion that one way to obtain security would be by including as nuisances dangerous or injurious to the public health all wasting cesspits and other unsafe methods of sewage disposal close to sources of public water-supply.

A paper on the effects of pumping on the river Cray, read by Mr. C. BEADLE, F.C.S., exemplifies the difficulties which often have to be encountered. The Kent Waterworks, it is stated, are depriving the river, the wells and the ponds in the district of their water. It is true the floods are reduced, but the flow in dry seasons is also diminished. The water is no doubt abstracted from the Cray by a private company for the benefit of the public in the Metropolis and elsewhere, but local interests have to suffer.

The Kent case is only one out of several which suggest the difficulty of balancing various claims. There is no supreme controlling authority over water-supply. It is therefore possible for a town or a company having sufficient means to obtain an Act and secure possession of a source

which, if properly treated, would also serve for several other places. It is possible that districts that from their position might be considered as having the first right to a supply are indifferent. They should not be allowed to follow a dog-in-the-manger policy, and monopolise what they cannot use. But in all such cases it is absurd to believe that out of the clashing of rival interests fair play will be eventually secured. If general control were exercised it would be easy not only to provide water at a cheaper rate, but there would be a more equable proportion in the supplies throughout the country.

In all attempts to deal with water-supply as a whole it is necessary, however, to reckon the one source from which all supplies above and below ground are derived, and that is rainfall. Dr. H. R. MILL rightly described rain as the life-blood of every country, and yet Great Britain is unique among all the great nations of the earth in having no public department to cope with the subject. What is known as the British Rainfall Organisation originated with a private individual, the late G. J. SYMONS. He was able to find many observers like himself, and during nearly forty years he carried on the important work of recording observations without any recognition from the Government. This fact alone testifies to the indifference which has been shown towards water. What are the consequences? People know so little about the facts that in many places the use of water approaches the limits of the supply, and it is difficult to see how the larger demands which are sure to arise with a more numerous population and more improved sanitation can be met. Then there is the continual changing of population, and the concentration in large towns creates problems which are not easily solved. It is evident that increased attention must be given to the direct utilisation of rainfall as a source of supply. But the projects which have appeared for such a purpose cannot be looked upon as practical, for the outlay would be so large, the water would become as costly as *vin ordinaire* in France.

Ignorance is the cause of the present disorganisation in regard to water. Dr. ALFRED GREENWOOD, one of the medical officers of health, was therefore right in advocating "the desirability of reports for the water-supply of each county." He would have information produced about the characteristics of existing water-supplies and their future requirements, which would enable those taking an interest in the subject to obtain clear indications of the places in which the water-supply is deficient. Those districts would be known in which there is a liability to contamination through using drinking water from shallow wells, ponds, &c. The available supply, and the sources from which additional water could be obtained in the different parts of each county would also be ascertained. But it could not be expected that the Local Government Board or any existing Government department would give any attention to the reports; and as long as official indifference exists we cannot expect that people would undertake a laborious investigation for the sake of adding to the archives of a county council. There is at present no probability that the statistics would be turned to account, and we are afraid things will long remain as they are.

Many of our readers will find the paper by Dr. J. C. THRESH, the medical officer of health for Essex, on "Water-Supply to Isolated Cottages and small Groups of Cottages," as coming more within their province. He affirms it is the general opinion among medical officers of health that the Public Health Water Act has been a failure; there are still large numbers of cottages without any proper supply of water. As he says, all the sympathies of the framers of the Act appear to have been on the side of the owners of existing property. For new houses certificates of supplies are necessary, but the supply is sometimes a privilege of which the tenant can be deprived without any notice. Wells are often inefficient, and the following instructions on the subject issued by the Chelmsford Rural Council are recommended for more general adoption:—

The water which enters a well at a depth of 6 to 12 feet, depending upon the porosity of the soil, is usually efficiently filtered and purified. Water entering at a less depth is nearly always liable to be imperfectly purified and unsatisfactory in quality. The nearer the ground surface at which water can enter, the greater the danger of pollution.

It follows, therefore, that the upper 6 to 12 feet of the well

should be water-tight, and that the top should be so finished off that no surface water can possibly gain access. It is also very desirable that the top of the well should be brought up 6 to 12 inches above the ground surface and covered with a proper flagstone or wood or iron cover. (Plans showing two of the simplest methods of well construction are appended). As no new house can be occupied without a certificate from the sanitary authority to the effect that the house has a sufficient supply of wholesome water, it is important that builders and others should pay particular attention to the above suggestions and so avoid the risk of a certificate being refused.

Dr. THRESH points out the need for a simplification both of law and procedure. It is not sufficient to prove that the water is dangerous to health in order to have a well closed; it must be proved to be injurious to health.

The subjects of water supply and river pollution, especially with respect to the Thames, and the standard of water, were also considered, and the papers and discussions are worth careful reading by all who take an interest in public health. It is evident that we are far from making our rivers and other sources of supply what they ought to be. It is supposed that a great work is accomplished when a Royal Commission prepares a report on any of the various questions relating to water. But as it is not the business of any public department to have the recommendations realised, the labours which have been undertaken seem to be useless. At the present time local authorities are not entrusted with all the powers which are demanded. It seems absurd that a rural sanitary authority must invoke the cumbrous aid of a Government department in order to define what is a reasonable cost for works. According to one of the text-books, "If the absence of a proper water-supply creates so great a nuisance that the house is unfit for habitation, proceedings should be taken for obtaining a justice's order prohibiting its being used for human habitation." Dr. THRESH says he has never heard of such an order being applied for, and he doubts very much whether any justice could be found in England who would grant one. While such anomalies exist without any effort on the part of the Government to remove them, we must expect that water can only be properly supplied and controlled in places like Manchester, Liverpool, Birmingham and Glasgow, where the local authority is too powerful to be disregarded.

### FORMAL GARDENS.\*

AN expression by a great writer on the relation between art and nature, or, in other words, between the ideal and the real, is sure to be prized. Hence it is that the lines in "The Winter's Tale," which are supposed to have been spoken by King POLIXENES, are so often repeated:—

Nature is made better by no mean  
But nature makes that mean: so over that art  
Which you say adds to nature, is an art  
That nature makes.

It is remarkable that the conversation should arise out of an experiment in gardening; and that it should be composed by a poet who was so long regarded as a representative of nature because of his indifference to art. In the Elizabethan time gardens were becoming more formal, and then as now there were probably many people who considered it was wrong to appear to control nature. In all such cases it is overlooked that a garden and formalism are inevitably allied. Cultivation is really interference with nature, compelling it to exert its force in one way rather than in another. Enclosures have to be of regular forms, and the simplest garden bed is evidence of the influence of geometry. In the arrangement of flowers a gardener is making a living bouquet which will exemplify his individual preference for colours or forms. It is always absurd to depart from what good sense dictates in order to seek after the creation of landscapes on a petty scale. Nature can do that much better than man. What has therefore been recognised as the most

fitting course to follow is to accept our limitations and to make the best of them. We thus bring gardening into harmony with other arts in which materials furnished by nature are turned to account. There is a passage in one of REYNOLDS'S "Discourses" which has not received sufficient attention, but which contains an epitome of the philosophy of the subject, and as such should be remembered by those who would prefer to see a garden recall a landscape of a wilderness rather than a work of design. He says:—

Gardening, as far as gardening is an art or entitled to that appellation, is a deviation from nature; for if the true taste consists, as many hold, in banishing every appearance of art or any traces of the footsteps of man, it would then be no longer a garden. Even though we define it, "nature to advantage dress'd," and in some sense it is such, and much more beautiful and commodious for the recreation of man; it is, however, when so dressed, no longer a subject for the pencil of a landscape-painter, as all landscape-painters know who love to have recourse to nature herself, and to dress her according to the principles of their own art, which are far different from those of gardening, even when conducted according to the most approved principles, and such as a landscape-painter himself would adopt in the disposition of his own grounds for his own private satisfaction.

REYNOLDS, although he was no landscapist, knew that painters when seeking landscape subjects would never have recourse to gardens in the natural style unless, like GAINSBOROUGH when he employed lumps of coal from the cellar to suggest rocks and pieces of firewood to suggest the trees of the woodcutter, they wished to utilise the littleness of the artificial landscape in order to recall its opposite. The advocates of "nature" also fail to remember that all the ancient accounts of gardening refer to the combination with plant forms of architectural structures. Indeed, it would seem as if BACON considered that a love of building culminated in gardening, for, as he wrote, "when ages do grow to civility and elegancy men come to build stately sooner than to garden finely, as if gardening were the greater perfection." It seems absurd that an application of geometry should be permissible in horizontal forms but prohibited in those which are to be vertical. Paths and beds can be laid out as circles, polygons, triangles, but, according to the professional gardener's theory, arches are assuredly out of place, and plain walls alone are fitting boundaries for the most elaborate garden, while a wall with balustrading is unsuitable. Artificiality is allowable in every form so long as it does not become architectural.

Fortunately the modern rule did not prevail at all times in England. A garden was recognised as a work of art which could be enjoyed on fine days. EPICURUS, says Sir WILLIAM TEMPLE, "passed his life wholly in his garden: there he studied, there he exercised, there he taught his philosophy; and, indeed, no other sort of abode seems to contribute so much both to the tranquillity of mind and indolence of body which he made his chief ends." The words express an older belief in England, and in consequence men made the garden a substitute for a picture gallery or a supplement to one. They introduced figures which could sustain the vicissitudes of the English climate, and they employed temples, vases, fountains and obelisks in order to impart variety and to afford a contrast by their permanence to the living but fleeting beauties provided by nature.

The new work on formal gardens, by Mr. INIGO TRIGGS, represents many pleasing examples which have survived. His plans and geometrical drawings will enable those who may be allowed opportunities to repeat the admired forms of old times. But the excellent photographs by Mr. LATHAM appeal to all who love beauty, for they show that in the garden, as in all other forms, it becomes a joy for ever. Indeed, the photographs constitute by themselves a collection of plates that would be competent, if hung on the walls of rooms of those who are in city pent, to give continual gratification, for they combine nature, art and antiquity.

From Montacute, in Somersetshire, we have the garden, house and pavilion, as well as a view across the pond. Here the enclosures are formed by balustrading, with obelisks at intervals. Although they are worn, the parts still retain gracefulness, and they are preferable to solid stone walls which some lovers of nature would substitute for them. Canons Ashby is another fine example with

\* *Formal Gardens in England and Scotland, their Planning and Arrangement, Architectural and Ornamental Features.* A series of illustrations mainly from old examples, with an introduction and descriptive accounts by H. Inigo Triggs. Part I. London: B. T. Batsford.

lion-guarded gate piers and yew boundary hedges over 250 feet in length, with arched openings. Longford Castle, Wiltshire, has a noble garden, and with great skill it is made to form a junction between the house and a wood. At one end is a temple with Ionic columns, containing a statue and making an admirable termination for a view. St. Catherine's Court, Somersetshire, is another terraced garden, in which the treatment bears a relationship with what is seen of the house. Penshurst, in Kent, has renown, and although less elaborately treated than some of the gardens, still retains much of its beauty. In Chastaton Manor House there is a circular garden surrounded by a yew hedge. In this place imagination was allowed to run riot, and it might be fancied at the first glance that some primitive forms of the time when dragons tore each other in the slime had been covered with verdure in the course of ages. Architecture did not count for much, for the gardeners, rather than the masons and the sculptors, were given unlimited powers, and it must be confessed there is not undisputed success. Another example of what is called topiary work (the word has many meanings) is from Heslington Hall, Yorkshire. Here vegetation appears shaped as cylinders, pyramids, and nondescripts which are similar to the capped granite forms we see in front of St. Paul's Churchyard. They are not models for imitation, nor are the stiff alleys of trees and the solidly built walls from King's Weston worth much notice except as records of laying-out grounds. All the old formal gardens were not necessarily perfect, and two or three other views are introduced which are curiosities more than models. In Belcaskie, Fifeshire, the terrace wall is supported by sloping buttresses. Each is surmounted by an immense bust, and the first thought of the spectator must be how they are prevented from slipping. Originally the arrangement was likely to have been different. Some plates are given of garden-houses, dove-cots, garden gates, lead figures, lead vases, stone vases and sundials.

The charm of the photographs, which have all been taken at a time when the gardens were looking their best, is enough to convert those obdurate upholders of the natural or pure landscape system who object to any intrusion by architects and their followers into their domain. It cannot be maintained that vegetation suffers in any way in a formal garden. It is easy to provide shelter or to allow an abundance of light in any position with constructional work in stone that will even in winter give pleasure to the spectator. But gardeners wish to claim all the credit for themselves and their plantings. They have a jealousy of balustrading, arching, and indeed of architectural forms in general and of sculpture in every form. It might be supposed that flowers must fade amidst those surroundings. It is of course possible to have an excess of artificiality in a garden, but that arises from a neglect to exercise sufficient judgment in the preliminary planning. The object of a garden is to exhibit vegetation under its most beautiful conditions, and an architect who would seek to make his work obtrusive by sacrificing flowers and shrubs is offending against the logic of his art. Mr. TRIGGS's work reveals how successfully the gardener and the architect have co-operated in the past, and with such examples before their eyes their modern successors should attain still greater victories, and bring about a closer relationship between art and nature.

#### WINDSOR CASTLE.

THE renovation of the Royal apartments at Windsor Castle undertaken by Messrs. Waring is near completion. As now treated, the rooms suggest a new note of refinement and delicacy of ornament which augurs well for the interior decorative art of the new century. It has not been an easy task to deal with a Gothic building already decorated in the early Victorian style. Messrs. Waring and their artists have grappled with the difficulties in a spirit of thoroughness, and with gratifying results. A brilliant effect has been obtained by employing large surfaces of cream-white as a background for the superb works of art in which these apartments abound. The rooms reserved for the Princesses are marked by a homely comfort and a total absence of everything in the way of regal splendour. They exemplify the tastes of occupants whose wishes have suggested simple wall-coverings of exquisite

design, comfortable nooks and corners made out of otherwise void spaces, a cosiness imparted to lofty rooms, and a distinct individuality indicated by the employment of deep white friezes.

In the King's bedroom, a splendidly-proportioned apartment, the colour predominating is an Irish green; at least the heavily-woven carpet from the Sister Isle, which gives the keynote of the colour scheme, is made by Irish labour, the silk panels and window draperies taking up the same colour in a softer tone.

The King's sitting-room is the one in which the late Prince Consort passed his last hours, and during Queen Victoria's lifetime the bed in the alcove and every other article were left in exactly the same position as on that memorable morning in December, 1861. The whole of the interesting features which identify the room with the close of an illustrious career have been preserved with reverent care. The ceiling has been slightly reduced in height, an eighteenth-century raised moulding in flowers and fruits of a simple form occupying the centre with a handsome console cornice. The whole is left a perfectly plain white. Below is a deep frieze or band of self-coloured soft green. The room has a high wooden dado, with bevelled panels and pilasters, forming an excellent background for the favourite family portraits which adorn the walls. A striking effect is obtained by the manner in which the woodwork has been finished off. It is made of solid mahogany, and painted in an ivory white, quite remarkable in its finish. This effect is obtained by a process of rubbing down or felting between each successive coat, the gloss which is apparent being obtained not by any form of varnishing, but by painstaking labour. An agreeable sense of warmth is, however, secured by means of a brilliant red Oriental carpet and softer toned red silk curtains. The furniture, it is interesting to note, dates from the end of the eighteenth century, and is, therefore, just 100 years old. The much-needed reparation of the coverings has been treated in such a way that it seems to enter completely into the decorative scheme.

Her Majesty's bedroom is panelled in a soft rose silk and the windows are hung with a pure white soft satin which hangs in ample folds and gives the necessary cool effect. The whole of the furniture is of the Empire period in design, and the bed draperies surmounted by the Imperial Crown make quite an imposing feature. The bathroom adjoining is panelled with a soft marble on one side and Sheraton wood on the other. The marble employed both in the King's and Queen's bathrooms is of Greek origin, from the quarries which have been reopened within the last year after having been lost sight of for over 1,000 years.

By general opinion the palm must be awarded to the scheme executed in the royal boudoir. Old Louis XVI. furniture has been transferred from another part of the Castle and covered in a soft-coloured Beauvais tapestry, and the carpet, manufactured in France at the State factories, is remarkably tender in colour, taking up the mother-of-pearl tints of old rose, green, blue, cream, &c. The broad old-fashioned gilt moulding round the panels has been retained and the centre filled in by one of the most beautiful silks which could possibly be designed for this type of Marie Antoinette room. Strained on the walls it has the appearance of a delicate ivory with hand-painted medallions suspended from floral wreaths. Similar silk is utilised for the draperies and palmettes. The graceful folds of the curtains produce all the effect and lustre of rich silk, which is moreover helped by a velvet border of soft heliotrope. The old satinwood doors have been replaced by beautiful Spanish mahogany with bronze ornaments in keeping with the general character of the room, which is certainly one of the daintiest conceptions of a ladies' apartment that the artist could produce.

#### ARCHITECTURAL ASSOCIATION OF IRELAND.

A MEETING of the members of the Architectural Association of Ireland was held in the rooms of the Institute, Lincoln Place, on the 7th inst., Mr. A. Scott presiding.

Mr. P. J. Lynch, of Limerick, read a very interesting paper on the "Early Christian Architecture of Ireland." The paper, which was illustrated by numerous lantern views, treated of the architecture of Ireland from the earliest Christian times to the period of the Norman invasion. Much of the paper was devoted to establishing the claim for a style of ornamental architecture in Ireland anterior to the Norman invasion, which was advanced by Petrie, yet not completely proved; but which recent research on the Continent and among pre-Norman remains in Great Britain goes far to remove all doubts. The resemblance between the round towers and the continental church towers at Ravenna, illustrated by views of both, was demonstrated, and the likeness between Lombardic and Irish architecture pointed out. Yet the essential points of difference were dwelt on as

sufficient to establish a truly national style of architecture. The direct influence of the Lombard or Comacine masters on early Irish architecture has yet to be proved, though in later years it is evident from the memorial slab of the master in Christ Church Cathedral. A strong plea was advanced for inquiry as to whether any portions of Cormac's Chapel, Cashel, might not be tenth-century work, as was generally supposed, until Petrie advanced it to the twelfth century, Petrie admitting at the same time that the records might mean a restoration. If it was a restoration, how far it extended is an interesting inquiry for the student of architecture, as it is now universally admitted that such a style of architecture was possible in the tenth century. Views of other specimens of Irish architecture from the tenth to twelfth centuries were shown, concluding with the nuns' church, Clonmacnoise, which Miss Stokes described as "lifting its mute form in silent witness to the life, as well as to the death, of native art."

Mr. G. P. Sheridan, vice-president, proposed a vote of thanks to Mr. Lynch for his excellent lecture. He said it occurred to him that the members of the Association might make measured drawings of the works shown on the slides by Mr. Lynch, to be reproduced in book form later. Such a book would meet with the ready approbation of architects and the public at large. All were deeply indebted to Mr. Lynch for sustaining, if not vivifying, their interest in their own architectural work here.

Mr. H. Allberry seconded the motion.

The Chairman, in putting the motion, expressed his thanks to Mr. Lynch for having come there and the research he had made and the study he must have given the subject.

Mr. Lynch having replied, the meeting adjourned.

### IDEAL BEAUTY.

A LECTURE was delivered to the Royal Academy students by Mr. Val Prinsep on "Ideal Beauty and Sentiment." He showed the impossibility of defining in what beauty consisted, lexicographers, philosophers, Emerson and others putting each a different interpretation on the word. One considered that beauty was perfection, but then arose the question, What was perfection? for what was so in execution might be deficient in beauty of sentiment. Beauty was an intangible thing, and, to him, abstract beauty did not exist. No published definition of the word satisfied artists. Each would form a conception of it for himself, though this ideal would result from tradition and from the quite unconscious education which began early from surrounding influence, and from which no one ever quite shook himself free, for perceptive qualities were evolved from reflective. Were beauty definable by rule the ideal woman of Chinese art would be ours also; but this was not so, although he acknowledged the ascination of that severely traditional school. Japan, the most artistic of all nations, desiring to acquire European education, sent delegates, who reported that in art there was nothing for their country to learn, as the Impressionist school was the only one worth study. It was essentially the same as their own, for the Japs. possessed marvellous power in expressing what they wished. Physical beauty was indescribable, partly because it was matter of personal preference, and partly in consequence of its being the puppet of fashion. Emerson declared it to be dependent on simplicity; but this would not do in face of the fact that elaborate headdresses, in themselves ugly, had been rendered beautiful by the art of Gainsborough and of Reynolds. An artist must find his own canons, but he must keep his culture, and to do so be ideal, though what he imagined must ways be more beautiful than what his hands could realise. The Greek ideal was lost when religion dictated that beauty was sinful, because it was connected with pagan deities. The Church allowed pictures of Madonnas and Crucifixions, not because they were things of beauty, but because they concentrated the mind on religious observances, just as Benares women made images from Ganges mud, on the spur of the moment, to pray to, and then threw them away. Gradually the Church tolerated a love of beauty, and it became a necessity. But the virgins of Botticelli or Lippo Lippi were not Greek, and the beauty of Raphael or of Titian's women was not human. Michel Angelo was inspired by the Classics, but was not Greek. He made a new ideal. So should artists of today, and they should always endeavour to reach the unattainable—perfection. Beauty was created by working on the emotions through the senses. Thus Raphael's cripple and Rembrandt's Jews gave pleasure by beauty which was not inherent, but by treatment. Sentiment, Mr. Prinsep averred, covered a multitude of sins, and he cited Reynolds, whose oftenilly drawing was redeemed by keen sense of grace and sentiment. Angelo's sentiment was conveyed by noblest form, and sentiment had its quintessence in J. F. Millet, who realised his ideal through figures and "effect," albeit of

commonplace scenes which Walker would have refined away, and lost the grim sentiment of Millet. It was the artist's investiture which improved nature.

### ROYAL SOCIETY OF ANTIQUARIES OF IRELAND.

THE report just issued by the Society is a satisfactory one from all points. It indicates a spirit of activity among its members that augurs well for the prosperity of the institution, and proves, besides, what a real benefit to the country at large such a Society confers. The total number belonging to it, including fellows and members, comes to 1,267, and as these are drawn from all quarters of the island, it can be seen what a store of information is obtainable, and what a diversity of subjects can be included in the purposes it was founded for. His Majesty the King was elected a member in 1864, and a life Fellow in 1870, and he has now intimated his pleasure to continue his patronage to it. There is a long list of new candidates to be recommended for election by the Council, and among those proposed as Fellow is the name of Lord Iveagh. The different excursions and meetings arranged for and carried out during 1901 were most successful and enjoyable. Hospitality was liberally extended by prominent residents in the distant places visited. Pleasant remembrances are entertained of the kindness everywhere experienced. This year the province of Ulster has been selected, and if all goes well the ancient and historic city of Londonderry will be the headquarters of the Society for a few days during the summer. Dublin naturally is the *locale* for the larger number of meetings, and several dates have been fixed for the popular evening gatherings, the first of which is announced for the 28th inst., being the evening of the day on which the annual general meeting of the Society will be held, at St. Stephen's Green. Some papers will be read, with lantern-slide illustrations of the subjects. The three papers that are promised are "Archbishop King's Diary, kept during his imprisonment in Dublin Castle, 1689, which has been edited with notes by the Rev. Professor Lawlor, D.D.," while Canon French will read some "Notes on Three Bone Pins found in Ballinderry Lake, co. Westmeath," and Mrs. Shackleton will show an exhibition of lantern-slides illustrating the scenes visited by members in the cos. Clare and Galway. There are other matters of interest mentioned in the report, notably that regarding treasure trove and the necessity for altering the present law about its recovery and purchase. The Society is to be congratulated on the marked prosperity it evidences and on the general character of the useful and important work it carries out and the excellent good feeling that is maintained among all its members of every class and creed.

### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. John Slater, vice-president, in the chair.

The Hon. Secretary announced the decease of Mr. J. Lee Hodgson, elected associate 1892.

#### The Prizes and Studentships, 1902.

##### THE ROYAL INSTITUTE SILVER MEDALS.

##### (i.) *The Essay Medal and Twenty-five Guineas.*

Four essays on the "Employment of the Order in Renaissance and Modern Architecture" were received for the silver medal. The Council did not award the medal, but they voted the sum of ten guineas to Mr. John Jeffrey Waddell, of Drumoyne, Uddingston, N.B.

##### (ii.) *The Measured Drawings Medal and Ten Guineas.*

Twelve sets of drawings were sent in. The silver medal and ten guineas were awarded to the delineator of Bolsover Castle, Mr. F. W. C. Gregory, of Nottingham; and prizes of five guineas each to the delineators of Lindisfarne Priory, Houghton Hall, and Aston Hall, Warwickshire, Messrs. R. Wynn Owen, of Liverpool, Stanley Towse, of Catford, Edwin Francis Reynolds, of Notting Hill Gate.

##### THE TRAVELLING STUDENTSHIPS.

##### (i.) *The Soane Medallion and 100l.*

Sixteen designs for a swimming-bath for men were submitted. The medallion and (subject to conditions) the sum of 100l. were awarded to Mr. James B. Fulton, of Glasgow; medals of merit to Messrs. Lionel Gordon Detmar, Sutton, Surrey, and Thomas Anderson Moodie, of Bayswater; and a certificate of hon. mention to Mr. E. Vincent Harris, of Regent's Park.

(ii.) *The Owen Jones Studentship and 100l.*

Seven applications were received. The certificate and (subject to the conditions, among others, that the candidate devote a tour of not less than six months' duration to the improvement and cultivation of his knowledge of the application of colour as a means of architectural expression, and furnish the Council with an original design in coloured decoration of a prescribed subject) the sum of 100l. were awarded to Mr. Edward H. Bennett, of Paris; a prize of 10l. 10s. to Mr. Percy Erskine Nobbs, M.A. Edin., of Chelsea; and a prize of 5l. 5s. to Mr. James McLachlan, of Edinburgh.

(iii.) *The Pugin Studentship and 40l.*

Twelve applications were received. The medal and (subject to the condition, among others, that the candidate devote a tour of not less than eight weeks' duration in some part of the United Kingdom to the study of Mediæval architecture) a sum of 40l. were awarded to Mr. Cyril Wontner Smith, of Finchley; prizes of five guineas each to Mr. Andrew Muir, of Hammersmith, and Mr. J. Myrtle Smith, of New Bond Street; and a certificate of honourable mention to Mr. John Harold Gibbons, of Manchester.

(iv.) *The Godwin Medal and 40l.*

Two applications were received. The Council awarded the medal and (subject to the condition, among others, that the candidate devote a tour of not less than five weeks' duration in some part of Europe other than Great Britain and Ireland, or America, for the purpose of studying and reporting on works of modern architecture) the sum of 40l. to Mr. Charles Archibald Daubney, of Peckham.

(v.) *The Tite Certificate and 30l.*

Twenty-four designs for a Royal Memorial Chapel in the Italian style were submitted. The certificate and (subject to the condition, among others, that the competitor, after an absence of not less than four weeks, shall submit satisfactory evidence of his studies in Italy) a sum of 30l. were awarded to Mr. Charles Gascoigne, of Sherwood, Nottingham; a medal of merit to Mr. Andrew Hutton, of Dundee; and a certificate of honourable mention to Messrs. W. Curtis Green, of Campden Hill; Arthur R. Gough, of Bristol; and Cyril Edward Power, of Bedford Row, respectively.

## PRIZE FOR DESIGN AND CONSTRUCTION.

*The Grissell Medal and £10 10s.*

Six designs for a timber footbridge across a stream were submitted. The medal and 10l. 10s. were awarded to Mr. Lionel Upperton Grace, Regent's Park.

## THE ASHPITEL PRIZE 1901.

The Council, on the recommendation of the Board of Examiners (architecture), awarded the Ashpitol prize (which is a prize of books value 10l., awarded to the candidate who has most highly distinguished himself among the candidates in the final examinations of the year) to Mr. Charles Thomas Adshead, of Liverpool. Mr. Adshead was registered probationer in 1894, student in 1897, and passed the final examination in November 1901.

A prize of books to the value of 10l. was awarded to Mr. Frederick Dare Clapham in recognition of the merit displayed by him in his work at the special examination, June 1901.

## THE TRAVELLING STUDENTS' WORK.

*Owen Jones Studentship, 1900.*—The drawings and design executed by Mr. George Andrew Paterson, who was awarded the Owen Jones Studentship for 1900, and who travelled in France, Italy and Spain, were approved.

*Godwin Bursary, 1900.*—The report of Mr. Sidney Kyffin Greenslade, who was awarded the Godwin Bursary in 1900, and who visited the United States of America to study the planning and construction of public libraries, was approved.

Mr. Greenslade was granted an extra sum of 20l. to enable him to continue his studies.

*Pugin Studentship, 1901.*—The Council approved the work of Mr. Henry William Cotman, who was elected Pugin Student for 1901, and who travelled in Wiltshire, Somersetshire, Dorsetshire, Gloucestershire, Warwickshire and Oxfordshire.

Mr. DETMAR J. BLOW read a paper, illustrated by lantern views, entitled

**The Architectural Discoveries of 1901 at Stonehenge.**

The lecture commenced with a reference to the archaeological investigations at Stonehenge in 1630 by Inigo Jones. The discourse on "Stonehenge Restored" was drawn up by Inigo Jones under the direction of James I. in the year 1620. After much reasoning and quoting a long series of authorities, Inigo Jones concludes at last that the ancient and stupendous pile must have been originally a Roman temple inscribed to Coelus, the senior of the heathen gods, and built after the Tuscan order. This notion was attacked by Dr. Walter Charleton in a treatise called "Chorea Gigantum," and the doctor was positive that this extraordinary monument was

erected by the Danes. The world did not generally accept this conclusion. Mr. Blow then described the recent investigation carried out under the superintendence of Dr. Gowland. He pointed out the archaeological value of the flint implements and stone mauls and hammers which were found in the excavations. The great monolith, he said, called the leaning-stone was the largest in England, Cleopatra's Needle excepted. It was one of the pillars of the highest trilithon, and stood behind the altar-stone near which it leaned at an angle of 65 degs. Half-way up it had a fracture on third across it, and the weight of stone above that fracture was a dangerous strain on it. It had now been brought to a vertical position. One Roman coin and one George III. penny were found quite near the surface. Numerous chippings of the sarsen and blue stone of which Stonehenge was built were discovered. The flints found were used for the softer sarsen and blue stones, and the hand-hammers and mauls for rough dressing. From this the deduction had been made that the building belonged to the Palæolithic period. All authorities agreed that it was the work of a highly civilised people. The construction was one of a stone development, and the surface of the stone was finished much like that of granite. The design of the pillars was in his opinion evolved from the shapes of the flint instruments used by the workmen, to which their hands had grown accustomed. Each pillar had a bold entasis in its elevation, and in its plan foreshadowed the column. With the aid of the illustrations he described the method of raising the leaning stone and the sifting process, the articles found being afterwards shown to the audience. Stonehenge having been generally supposed to be of the Bronze Age, it was with great joy that he lighted upon the stone implements. It was, he believed, the only occasion on which the implements were found actually next to the stone building where they were used.

Sir NORMAN LOCKYER, in opening a discussion on the paper, said he believed archaeologists had come to the conclusion that from the evidence which had been obtained they were justified in assuming that the sarsen stones were erected in the Palæolithic times—that was to say, before the age of bronze or at all events before bronze had been used for any ordinary kind of work in that part of England. Before the excavations were commenced Mr. Penrose and himself had been occupying themselves with Stonehenge from a slightly different point of view. They were very anxious to determine its age, and it was found much easier to get certain astronomical data from Stonehenge owing to its position than from other ancient monuments. He gave a number of astronomical data in support of his assumption that Stonehenge was a solar temple and one used for observation in the height of summer. From their observations they came to the conclusion that the avenue which was associated with the sarsen stones was laid down about the year 1680 B.C. Such temples as Stonehenge were erected in the very first blush of civilisation in order that the people should be able to fix the time for performing agricultural operations. He thought that Mr. Penrose and himself had been able to show beyond all doubt that we had in Stonehenge a temple for observing the length of the year by observing the rising of the sun on the longest day of the year, although in other parts of England there were temples for observing the sun not on June 21 but early in May and early in August.

Mr. F. C. PENROSE, who followed, said he rejoiced at the fact that so much attention was now being paid to Stonehenge and that the repair of the temple had begun in a safe and legitimate sense by raising the leaning-stone out of a position of danger. He asked whether the chippings of the sarsen were found in much greater abundance than the blue stones, as it was possible that the blue stones might have been altered in their position to suit the sarsens when they were put up.

Mr. BLOW replied in the affirmative.

Mr. EMANUEL GREEN expressed the hope that the authorities would not prevent further investigations on the subject. There were various arguments relative to the probable history and origin of Stonehenge. The conclusions from different theories seemed reasonable and clear, but by continuing the investigations they might hope by degrees to get rid of what was not true and in the end attain exactness.

Mr. W. H. ST. JOHN HOPE also joined in the discussion.

A vote of thanks proposed by the chairman and passed with acclamation terminated the meeting.

**The Sanitary Institute** have issued diagrams and descriptions of three terminals which appeared to give the most favourable results in the experiments conducted by the committee. They can be copied or imitated, for, although application for provisional protection for the three forms of terminals referred to was made by the Institute, it was in order to prevent any monopoly being established. The Council do not wish to put any restriction on the use or manufacture of any of the terminals patented, or other new forms represented in the report.

## TESSERÆ.

## The Pleasures of Painters.

THE pleasure which the generality of mankind receive from any celebrated painting is trifling when compared to that which a painter feels if he is a man of any common degree of candour. What is to them only an accurate representation of nature is to him a beautiful exertion of genius and perfect display of art. The difficulties which occur to his mind in the design and execution of such a performance, and the testimonies of skill, of taste and of invention which the accomplishment of it exhibit, excite a variety of emotions in the breast of which the common spectator is altogether unperceptive; and the admiration with which he thus contemplates the genius and art of the painter, blends itself with the peculiar emotions which the picture itself can produce, and chances to him every beauty that it may possess. The beauty of any scene in nature is seldom so striking to others as it is to a landscape-painter, or to those who profess the beautiful art of laying out grounds. The difficulties both of invention and execution, which from their professions are familiar to them, render the profusion with which nature often attatters the most picturesque beauties little less than miraculous. Every little circumstance of form and perspective, and light and shade, which are unnoticed by a common eye, are important in theirs, and, mingling in their minds the ideas of difficulty and facility in overcoming it, produce altogether an emotion of delight incomparably more animated than any that the generality of mankind usually derive from it.

## The Medicean Venus.

The question whether the Venus de Medicis was a copy from the Cnidian Venus of Praxiteles has often been discussed. The affirmative generally prevailed, till Heyne, in his dissertation on the different manners of representing Venus, and Montfaucon in his disquisition on the two statues of Venus in the Vatican Museum, adduced such plausible arguments on the negative side as were generally deemed conclusive. Niebuhr, professor of antiquities at the Royal Academy of the Fine Arts of Berlin, when discussing the problem, began with inquiring, What are the ideas we can form of the Cnidian Venus from ancient authors? All that is said by those who refer to her into some detail respecting it, among whom Pliny and Lucian are particularly to be noticed, may be reduced to five points. (1) The Cnidian Venus, the masterpiece of Praxiteles, was naked, and covered herself with one of her hands—it is not said with which. (2) It was finished all over with equal perfection. (3) All the parts were in exquisite proportion. (4) Particularly the hair, forehead, eyebrows, hips and thighs. The expression of the countenance was languishing, but mixed with modesty; a smile was produced by a slight opening of the mouth. (5) The statue was considered as the most perfect of the works of Praxiteles. How far does the Venus de Medicis agree with these characteristics? In the first place she is naked, like that of Cnidus, and covers herself with her hand; but the other hand is applied to the bosom, which Lucian does not mention. (2) The statue is equally finished all over. (3) All the parts of the body are in perfect proportion except the head, which is rather small. (4) The expression of the countenance, eyes and mouth has nothing repugnant to the account of the ancients. (5) The Venus de Medicis occupies the same rank among the ancient statues now existing as that of Cnidus held in ancient times. To this may be added, that the Venus de Medicis was no doubt a work much esteemed by the ancients, since it is said that its hair was gilt, its ears adorned with very valuable drops and its arms with golden bracelets, and that the goddess has by her side a dolphin, springing on its back amorini or genii, which may be supposed to have given rise to the epithet of "euploia," "pleasantly sailing," given to the statue of Praxiteles, as Pausanias informs us. Hence we might conclude that this was at least a copy of the statue of Praxiteles, if not the original itself, were there not sufficient reasons to believe that the Cnidian Venus differed essentially in form and attitude from the Medicean. But this is actually the fact, for medals of the isle of Cnidus have been discovered, on which the goddess is represented very differently from the Venus de Medicis. On these medals the goddess appears naked, covering herself with the right hand, and with the other lifting a garment from a vase by her side. She holds a garment at a distance from her body, with her head inclining to the left; her hair is not tied on the top of her head, as in other representations of Venus. The legend around has the word "Knidion," and on some medals this figure is accompanied with one of Esculapius. Now it is highly probable that these medals represent the statue of Venus by Praxiteles, which was the chief glory of Cnidus, because the inscription refers them to that city; they agree with the ideas of the statue given by the ancients. A similar figure of the goddess appears on the medals of no other city; and what is a still more striking circumstance, and almost unique in the history of medals, there is at present in existence at least four antique statues which

have exactly the form and character of the goddess represented on the Cnidian coins.

## Greek Shields.

Dr. Meyrick, speaking of the shields of the Mycenæans, which were made in the shape of an ivy-leaf, composed of the hides of white oxen, with the hair on, says, "In ancient times the shape of the shield had much to do with the mythology of the people, and therefore were circular to represent the sun, crescent-like to imitate the moon, &c." The ivy-leaf was sacred to Bacchus, and it might be from this people that the Greeks derived the *pelta*, which Xenophon describes as of the same form. The first shields were made of basketwork, to which succeeded light wood. The most usual material was, however, ox leather, covered with metal plates. The middle had a plate of metal, the Latin *umbo*, often furnished with a thread of metal, turned in a circle or spirally. At first there was no other mode of carrying and managing the shield but by a piece of leather, suspended from the neck over the left shoulder; Eustathius says a leathern thong, or a brass plate. This apparatus often appears upon the Etruscan monuments. These handles, says Herodotus, were inventions of the Carians. The arm-ring was independent of two smaller, placed upon the edges of the buckler to be laid hold of by the hand. This mode appears very distinctly upon the shield of Diomedes in the Monumenti Antichi. When, after war, the shields were suspended in the temples, the handles were taken away, to prevent their being of service in sedition. Æschylus says that bells were sometimes added to shields to affright enemies by the sudden sound, but Dr. Meyrick could not find a specimen. The Carians also introduced the ornaments of symbolic or allegorical figures, attesting the antiquity of their origin and the valour of their ancestors. The Peloponnesians engraved their initials upon their shields in order to distinguish themselves in battle. Thus upon their coins often occurs only a monogram of the two first letters of their names. The Greeks carried the shield upon either arm, as do some gladiators in Stosch, the paintings of the Villa Albani and other monuments.

## The Colossal In Architecture.

The emotions which church architecture should naturally inspire—if it should inspire any—are those of veneration, humility and awe, and no species of architecture will so certainly inspire these emotions as that which deals in stupendous representations of living beings. This the ancient Egyptians well understood, and we can scarcely conceive anything better calculated than the architecture of some of their temples for quelling the spirit of the worshipper and banishing the arrogance and pride of heart which stand in the way of devotional feeling. Among their avenues of sphinxes and halls supported by images of human beings 100 feet high the spectator collapsed to the dimensions of an insect, and acquired a lesson more powerful than a thousand homilies of his own frailty and insignificance. There may be much in the Egyptian architecture that naturally excites rather ridicule and disgust than solemnity and veneration. The anatomical imperfection of the different representations of living objects—for example, the grotesque hieroglyphics and many other peculiarities—are all far from pleasing, and we are perfectly confident that any attempt to revive the true Egyptian architecture in the present day could not succeed. But we think the employment of similar instruments of emotion without any more regard to those details which more particularly give the Egyptian complexion than if they had never existed could not fail under judicious treatment to be eminently popular and successful. It would, of course, be applicable only to particular kinds of edifices, chiefly churches, and should neither imitate ancient peculiarities nor neglect any of the aids afforded by the skill and science of the present time. The sculptures should be as true representations of natural objects as the present state of skill can produce, and those objects should be such as are agreeable in themselves, and as at the same time are possessed of sensation.

## Hypæthral Fenestration.

Among the many advantages attending hypæthral fenestration we may enumerate these:—It admits of greater diversity of design than what is of necessity the usual mode; it enables the architect to bring in one of the principal rooms where it would otherwise be impossible; it shuts out from view what, if seen, would be unsightly; it conduces to regularity and balance by allowing design to be kept up and decoration carried on continuously, whereas the effect is marred when one side of a room is cut up by being nearly all window in the daytime and nearly all drapery of an evening; it produces variety by the contrast between the sky-lighted and window-lighted rooms; and it admits of still further contrast at night by burning the gas externally—a mode that has already been practised in one or two instances, and is capable of being made particularly striking.

## NOTES AND COMMENTS.

PEOPLE who insist on the necessity of a transformation of London streets would often do well if they calculated the probable cost of their projects. The proceedings at the last meeting of the Westminster City Council reveal the outlay that is necessary for widening the Strand for a short stretch, and in a position which cannot be regarded as the most important part of the thoroughfare. The improvements committee presented a report which showed that it would require at least 92,590*l.* in order to alter the Strand between Nos. 89 and 104. The London County Council in July last resolved to contribute 50,000*l.* towards the cost, but the setting back of three other houses was found to be necessary, and the estimated cost of this portion of the improvement is 31,787*l.* The committee consider that a further contribution of 20,000*l.* should be made by the London County Council. The net estimated cost to the city of Westminster would therefore be 22,590*l.* Subject to the Worcester Buildings Company's acquiring, with the assistance of the Council, all interests in 91, 92 and 93 Strand, and surrendering the land necessary for a uniform widening of the Strand between the Hôtel Cecil and Terry's Theatre, and subject also to the making of a further contribution of 20,000*l.* by the London County Council, the committee advised the Westminster Council to offer 90,000*l.* for the land to be surrendered for the widening (such land being estimated to measure 4,374 superficial feet or thereabouts), exclusive of the land to be surrendered without payment by the company under their agreement with the late Strand District Board of Works. The expenditure is so large, an effort was made to delay the decision until more consideration was given to the subject, but eventually the recommendation was adopted.

IN the Farnesina of Rome, which PERUZZI erected for AGOSTINO CHIGI, the banker, RAPHAEL was employed as the chief decorator. For it he produced his *Galatea*, in which he rivalled the Greek masters. Another commission he received was to paint the lower hall, and he selected the legend of PSYCHE as best adapted to supply the desired subjects. The ceiling was flat, but connected with pendentives, and in the spandrels he introduced a series of scenes. It is maintained by some authorities that he only prepared the beautiful designs and left the execution to his pupils. He is believed to have relied on APULIUS for the incidents. A paper was read at the last meeting of the German Archæological Institute at Rome by Dr. STEINMANN, in which he held that RAPHAEL contemplated the representation of the earthly incidents relating to PSYCHE on the walls of the hall, whilst the roof was assigned to those which took place above the earth. Hence such subjects as the Introduction of Psyche to the three goddesses, Mercury bearing Psyche and the Feast of the Gods. Dr. STEINMANN is of opinion that RAPHAEL prepared the designs for the wall-paintings, and although he was not able to direct their execution, they were utilised by PIERIN DEL VAGA when he adorned the walls of the Papal apartment in the castle of St. Angelo. They have been neglected by amateurs, but they display a spirit which justifies the declaration of VASARI that DEL VAGA was the ablest of all RAPHAEL'S scholars.

WE hope the negotiations for transferring Leighton House to the Kensington Council have been only temporarily suspended. Evidently there has been a misunderstanding on both sides. Mr. RUSSELL BARRINGTON, who is the representative of the owners, announced he could only agree to a transferring of the property "on such conditions as will satisfy me personally that the objects for which the sisters of Lord LEIGHTON offered the house as a gift to the public, and for which the promoters of the scheme have worked so assiduously for so long, will be loyally carried out." Apparently he feared that the house would not "be maintained in a manner worthy of the dignity of its associations." The sisters of the late artist also said:—"When we expressed our willingness to give the house to the nation it was under a fixed impression that the recipients, whoever they might be, would welcome our gift, even at the cost of maintaining it, and that it would be maintained for purposes in which parish 'business' could have no part. Failing this, we would

personally far rather see it destroyed, or, since that out of the question, sold to some decent individual who might value it for what it is, and would at all events secure for it the dignity of private possession." The interpretation which can be placed upon these words is that the owners were afraid the house would not be respected as a sacred possession which should be entered only by those who were in a state of awe, and who would not criticise whatever was exhibited. On the other hand there were people in Kensington who were apprehensive that the house would be kept up for the benefit of a select few instead of being considered as a public museum. It is not compulsory on those who walk about Kensington Palace that they should be reverential, and so long as there is no interference with the objects displayed there is perfect liberty. The Kensington Council might be trusted to show common sense in their arrangements, and Leighton House would become an aid in educating popular taste. But if visits can only be made in fear and trembling it is better to allow the building to remain as it is in all the dignity of private possession, and to spend the 500*l.* per annum which would be necessary for its conservation in some other way.

## ILLUSTRATIONS.

MARQUETRY PANELS FOR THE "ORONTES."

THE illustrations are reproduced from the designs for the decoration of the drawing-room of the *Orontes*, a new ship now being built by the Fairfield Shipbuilding Company for the Orient and Pacific Company's line. There are about thirty panels, which are cut in holly and satinwood. Almost every panel differs in design. In addition to the panels is a frieze 130 feet long and 9½ inches deep, which is also in satinwood and holly. The frieze varies in design throughout its entire length, and is, perhaps, the most important and interesting decoration in the room. In the design of this work the general idea is based on forms belonging to the sea—shells, more or less modified, and various kinds of seaweed, so far as they can be treated decoratively, have been used in the design. The only exceptions are the children and naiads, who are, however, draped in seaweed. The designs were prepared and the engraving executed by Mr. STEPHEN WEBB, the architects being Messrs. J. J. STEVENSON and H. REDFERN.

ST. MARY'S CHURCH, ECCLESTON, FROM SOUTH AISLE, LOOKING NORTH-EAST.

NEW LIBRARY, PATENT OFFICE.

AMONG all varieties of record offices there is not one which attracts so many investigators as that connected with the Patent Office in Southampton Buildings and Staple Inn. Indeed, to many people the *raison d'être* of such an establishment is the preservation of specifications and other documents relating to inventions. Everyone knows how easily an invention can lose its value should there be any anticipation of it, and it is accordingly needed to make certain that a claim cannot be raised on account of priority. Hence the necessity of a storehouse which will contain all information that is attainable about British and foreign inventions. The new library which was opened a fortnight ago is strictly utilitarian in character. Those who make use of its contents are too engrossed with their investigations to bestow attention on the qualities of the architecture, for it is of more importance to have accessible information and to be spared loss of time in researches. It will be seen from the illustration that accommodation is provided for a large number of inventors, specialists, agents and students. The bookshelves for their use are estimated to measure about three miles in length. Care has been taken in the classification of the works, and information of any branch of technology is to be obtained without delay. Once upon a time inventors made use of anagrams and cyphers in order that their knowledge might be confined to themselves, but in our time there can be little concealment. A patent office, with its specifications and books of reference, is therefore a realisation of BACON'S great desire "to draw the sciences out of their hiding-places into the light."

The new buildings were designed by Sir JOHN TAYLOR and were carried out by Messrs. PERRY & CO. under the direction of his successor, Mr. HENRY TANNER.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. W. H. Seth-Smith, president, in the chair.

Messrs. E. J. Harbottle, R. Hebert, J. R. Hobson, L. de B. Celsey, E. P. Lee, A. G. MacNaughtan, H. A. Porter and W. S. Read were elected members.

The amount subscribed towards the new premises fund was published as 3,567*l.* 12*s.*, inclusive of the following donations:—Messrs. Robert L. Curtis, 105*l.*; R. A. Briggs, 2*l.* 12*s.*; John Leaning, 10*l.* 10*s.*; H. J. Leaning, 5*l.* 5*s.*; H. Cassmore, 5*l.* 5*s.*; E. Boehmer, 2*l.* 2*s.*; M. F. W. Bunney, 2*l.* 2*s.*; Guy M. Nicholson, 2*l.* 2*s.*; C. E. Simmons, 2*l.* 2*s.*; D. Stewart, 2*l.* 1*s.*; G. H. Smith, 1*l.* 1*s.*; P. Rider Smith, 1*l.* 1*s.*; F. J. Potter, 1*l.* 1*s.*; W. B. Dukes, 1*l.* 1*s.*; C. M. C. Armstrong, 1*l.* 1*s.*; P. R. Smith, 1*l.* 1*s.*

Mr. T. C. CUNNINGHAM read the following paper on

## Architectural and Constructional Engineering.

Mr. President and Gentlemen,—When promising to read a paper upon "Architectural and Constructional Engineering" the paramount idea was to endeavour to interest the members in the subject, whatever may be the diversity of opinion in regard to what I may have to say relative thereto. Nevertheless, it is a subject I would suggest it is desirable and advisable that every architect or member of the Association, particularly the younger ones, should seriously consider, having regard to its increasing importance. To lay the subject before you in as concise a form as possible I will describe a series of steel-framed structures that have been erected recently. In the first place, I propose to deal with American tall structures, and then give some examples of roofs executed to fulfil specific requirements.

In designing tall business buildings on the American principle, the initial inception and purport of their being are business propositions, erected for the advancement of business interests and enlargement of the income of the owner of the estate. In buildings so designed many of the engineering problems are shorn of difficulties, and their solution becomes simply the working out of the inevitable and logical trend of the underlying idea of the general plan. The disposition and subdivision of an enclosed space is the foremost problem, and the first element in its solution is the use and occupation proposed for the building by its owners. This may require few rooms or many, large rooms or small, or a combination of both. Under all conditions which may govern the subdivision of space it is possible, no matter how small or how irregular the necessary dimensions of the proposed rooms may have to be, to so adjust and group their spacings that there will be a regularity and symmetry which permits the introduction of a unit of subdivision. In determining this unit of subdivision the directing factors will be: (a) the necessary dimensions of the rooms resulting from the proposed occupation; (b) the requirements of the framing of the skeleton of the building; and (c) the exigencies of the artistic expression of the proposed external presentation. The unit of subdivision will also be the unit of construction and the unit of design. If the individual rooms are quite small it may be well to combine two or even more to one unit. Within certain limits, the economy of metal in the construction of the skeleton leads to the adoption of a large unit. The greater relative strength of the deeper beams, the smaller number of connections, the smaller number of pieces to be handled, all favour the large unit; and the reduction in number of pillars, affording greater freedom in subdivision and utilisation of space, will enhance the commercial availability and value of the building. Again, the greater depth of beams and increased dimensions of pillars afford large contact areas and rivetting surfaces at junction points, and thus give better opportunity for attaining a rigidity of connections which is in itself a long step toward efficient wind-bracing. On the other hand, greater beam depths increase the height of each storey, which, where there are legal limitations of height of buildings, may cause the loss of a storey, and therefore of its possible rental. Increased span and consequent greater height of beams may involve additional cost of floor arches, perhaps counterbalancing, or even exceeding, the saving in cost of beams and pillars. Whether the unit of subdivision be larger or smaller is undoubtedly an important factor in the artistic success of the external treatment of the building, but the personal equation of the designer and so many other varying conditions influence and affect artistic results that each case must be decided on its own merits. However, the gain in wall surface incident to the use of larger, and therefore deeper, beams is unquestionably also an aid to the artistic development of the design. Thus far, what has been stated relates to the adaptation of the building to existing conditions and wants. So much capital is invested in a modern high building that its design should embody certain general preparations for possible future changes of use and occupation, so far as these can be made without impairing present usefulness,

and, above all things, its design should embody all that is necessary for insuring permanence and comparative indestructibility of structure. This at once draws the attention of the engineer to the character of the foundations, unless these should fortunately happen to rest upon a uniformly and permanently incompressible soil. With all the ingenuity and the economy of time and money incident to its application, it must be admitted that the so-called Chicago raft foundation cannot be recommended for use upon compressible soil by reason of its liability to serious disturbance by future underground works in adjacent or neighbouring streets; but that the footings should be carried through the compressible strata to the underlying rock, and for this purpose timber piling cannot be trusted as affording a guarantee of safety for many years, unless there is absolute certainty of maintenance of water-level in the underlying soil. This will in many cases make concrete piles, or caissons containing masonry or concrete piers, the only scheme of foundation construction which warrants the permanence of the supports of the structure.

The first building I propose to describe will be—

The Park Row building, New York, Mr. R. H. Robertson being the architect, and whose name is known in connection with the American Trust Society's building, the Corn Exchange Bank, &c., and Mr. Nathaniel Roberts, the engineer, the latter being responsible for the whole of the structural steelwork, and it is this portion of the building that I wish more particularly to describe as typical of American high-building construction. The building belongs to the Park Row Construction Company, and occupies the site of the old International Hotel, opposite the post office. It is twenty-six storeys high in the middle part, while the two towers are each four storeys higher, making in all thirty storeys. The total height of the building from the level of the kerb in Park Row to the top of the cupolas is 386 feet. The building frontage is 103 feet 11 inches in Park Row, 20 feet in Ann Street and 47 feet 10 inches in Theatre Alley, while the depth from Park Row to the Alley is 153 feet 7 inches and the area covered is 15,000 square feet. The structure is carried entirely on piles driven into a sand foundation to a depth of about 20 feet. There are about 3,500 piles used in the construction. They are of round American spruce, free from knots, with the bark left on. They are from 10 inches to 14 inches in diameter at the head, and the load on each does not exceed 16 tons. They are driven at from 16 inches to 18 inches apart, centre to centre, commencing at the centre of each group and working outwards, while the rows are about 24 inches apart, centre to centre. The heads are cut off below the level of ground water, or at 34 feet 4 inches below the level of the kerb in Park Row. From 12 inches to 16 inches is excavated out around the head of each pile, which space is filled in with concrete composed of 1 part Portland cement, 2 parts sand and 5 parts broken stone not more than 2½ inches cube. The concrete is levelled up flush with the heads of the piles. Upon the top of the concrete are laid granite blocks to receive the brick piers which carry the grillage beams to be described later.

The column loads carried by the foundations of this building are very high, some of them exceptionally so. It was therefore necessary to distribute the pressure on the grillage beams as evenly as possible. The need for great care in this matter will be evident when we say that the weight of the steelwork alone is 9,000 tons, while Mr. Roberts estimates that the weight of the building is 56,200 tons, or a total of 65,200 tons.

Most of the columns rest on distributing girders, each girder carrying, as a rule, two columns, though in one case there are as many as four columns on one girder. The interior columns have no distributing girders but rest directly on the grillage beams, and have each an independent foundation. Each foundation was separately designed for the load it had to carry, and the size of the girders and the grillage beams vary accordingly.

A typical distributing girder was shown in detail together with the grillage beams and granite coping blocks underneath them. This girder supports columns each of which carries about 1,100 tons, so that the girder itself sustains a load of about 2,200 tons. It is 26 feet long and 8 feet deep, and has four web plates, each ¾ inch thick. There are four angles, 6 inches by 6 inches by ¾ inch, in each flange, together with three plates, each 2 feet 8 inches wide by ¾ inch thick. The girder is carried on thirty-five joist beams 12 inches deep and 5 feet long, which are separated by distance pieces. In the foundation in question there are four of these distance pieces between every two beams, but in some of the foundations, where the length of the beam is 6 feet, there are six distance pieces between every two beams. The distance pieces are box-shaped, and have milled surfaces which bear evenly on the top and bottom flange of the beams. The grillage beams rest on the top of the granite caps and are bedded on cement.

The largest distributing girder is that carrying the four columns facing Theatre Alley. It carries a load of about 2,930 tons and weighs 47 tons. In the manufacture of all the

distributing girders it was particularly specified that the vertical angle iron stiffeners should have a good bearing against the top and bottom flanges.

This girder for Theatre Alley front is carried on sixty-one joist-beams 12 inches deep and 4 feet long, these being placed on the top of the granite caps, as described, for the girder-carrying columns. All the columns which do not rest on distributing girders are carried on short independent girders which rest on joist-beams supported by the grillage-beams so as to distribute the weight evenly over the granite caps of the piers.

The floor-beams are generally composed of the joist-beams bolted together with  $\frac{3}{4}$ -inch bolts, and have cast-iron distance-pieces between them. There are three or four distance-pieces to each span, and they are so made that the flanges of the joist-beams will not be less than  $1\frac{1}{2}$  inch apart. The beams which carry the fireproof flooring are all tied together with  $\frac{3}{4}$ -inch bolts to take the thrust of the flat arches. The floor-beams are framed so that the bottom presents two different levels, one 5 inches above the other. In the area, where 15-inch beams are used, the beams and girders are framed flush, the 10-inch and 12-inch beams being framed flush at the bottom, which is 5 inches above the bottom of the 15-inch beams.

Box and lattice girders are used for connecting the columns at the walls, and they are attached to the columns in such a way as to make the connections as stiff as possible, in order that it may do service as vertical wind-bracing. Great lateral stiffness is given to the building in this way.

The typical lattice girders have all the flange angles so far apart as to allow an easy means of attaching the cast-iron lintels and sills. These girders are connected at the top and bottom flanges to angle pieces on the columns, which also give great lateral stiffness to the building.

As stated, some of the main columns each carry about 1,100 tons on the lower length, which rests on the distributing girder, and though this load is not quite the heaviest carried by any individual column, it is not far short of the maximum, and as these columns are in the Park Row front and are typical of most of the others in the building, I have taken them as an example.

The bottom length of the column, where it rests on the distributing girder, has a flange plate at right angles to its axis, which plate is securely rivetted to the body of the column with angles by means of a double line of rivets, while at its upper end, where the next column length rests, it has angles forming a flange but no plate. The ends of the two lengths of columns are faced so as to bear very truly one on the other, and are rivetted together through each angle. In addition to this there are two splice plates, one on each side of the column. These plates are firmly rivetted to the lower length in the shops, but the part projecting above the top is rivetted to the next length of column above when they are erected on the site of the building. These rivets pass through the splice plates and the sides of the column. This forms a very strong joint, and is preferable to the method of fixing by means of angles alone, as it makes the whole column much stiffer and better able to resist the side stresses due to wind. This way of jointing the different lengths of the column is adopted from the bottom to the top, so that the combined lengths are formed into one united whole, which extends from the cellar to the roof.

The method of carrying and fixing the box and lattice girders which carry the walls, and also the floor girders:—Angle brackets are rivetted to the body of the column in order to support the ends of the girder where they abut against the plates. These brackets are stiffened by vertical angles which bear up against their underside, and thus form a very strong support. There is also an angle bracket rivetted to the side of the column some distance above the lower one, and in an inverted position in regard to the latter. The distance between these angles is equal to the depth of the girder which abuts against the column at this point, and when the girder is in place its upper flange is rivetted to the upper angle in such a way as to add lateral stiffness to the building, for it has been found absolutely necessary in these high buildings, which are subject to great wind pressure, and where it is often very difficult, and sometimes impossible, to put in diagonal wind-bracing, that either the method adopted in the present case or the use of knee-brace or portal bracing becomes necessary in order that the building may have the lateral stiffness which is required for its safety. This method of stiffening by rigidly fixing the girders to the columns is employed in this, the Park Row building, in conjunction with diagonal bracing. In some of the other lengths of columns, the brackets which carry the girders are formed of plates as well as angles, but in almost every case the girders are rivetted through the upper flange to angle brackets on the columns. All the abutting surfaces of the columns are planed to an even bearing. All the columns in the walls are carried up 3 feet above the roof-beam, and are there connected with a line of 8-inch channel under the coping.

The Montgomery Ward & Co.'s building at Madison Street and Michigan Avenue, in the heart of the Chicago business district, is a twelve-storey commercial and office building with 86 feet frontage, 159 feet high, on Michigan Avenue. For business reasons it was specially designed to be conspicuous, and on this account a tower 390 feet high and 40 feet square at the base was made the central feature of the Michigan Avenue front, and which contains thirteen additional storeys above the main roof.

The lower three storeys of the main building are treated a base, 45 $\frac{1}{2}$  feet high, and are faced with rusticated courses. The twelfth storey is treated as an entablature, and has a deep roof cornice. The main entrance is through a two-storey pedimented portico, embellished with marble sculpture, the tower forming a central feature, rising from the entrance with unbroken shaft lines continuous through the interrupted roof cornice to the top of the eighteenth storey, where there is a cornice course, and above it the nineteenth-storey balcony, with arched windows surmounted by a deep moulding which forms a capital at the twentieth storey. Above this the sides of the tower are narrowed to about 30 feet, and at the twenty-second floor begin to converge for the pyramidal roof.

The concrete foundation piers are set on steel grillages on about 1,200 15-inch piles. These are 52 feet long, driven to 68 feet below grade, and are calculated for maximum loads of 25 tons each. The steel columns are of closed rectangular cross-section, made up of pairs of channels and flange cover plates, the largest having an area of about 180 square inches of steel. The tower is calculated for a wind pressure of 30 lbs. per square foot on its vertical projections above the main roof, and the remainder of the building is calculated for the same wind pressure on all exposed vertical surfaces of the two ends of each elevation. The wind stresses parallel to Madison Street are assumed to be resisted by the rigidity of the walls, floors and partitions, and by the strength of the beam and column connections. In the direction parallel to Michigan Avenue there is special wind-bracing, consisting of solid plate stiffened knee-braces at the top and bottom of each end of the wall girders, and of horizontal plate girders, 30 inches deep, with 6-inch by 4-inch flange angles, at every storey between the corner column and the one adjacent to it. A similar construction on all sides of the tower is carried up to the twentieth storey, where the knee-brace brackets are replaced by longer and heavier knee brace struts connecting the tops of the corner columns to the system of plate girders which forms a rigid horizontal frame work supporting the overhanging twentieth floor. There are twelve outside columns and no interior ones in the tower. Up to the eighteenth storey its floor framing consists of two 24-inch transverse joint-beams supported on the two pairs of intermediate columns, and of seven longitudinal lines of 8-inch joist-beams which are supported by these girders and by the pairs of 15-inch wall-girder channels which connect the columns, and in four places by direct connection to the intermediate columns. A 9-feet by 10-feet panel in the middle of the floor has additional framing for the circular elevator shaft. At the eighteenth storey light channels, beams and angles are bracketed out a short distance from the columns just above the floor line to carry a projecting terra-cotta belt course.

The Electric Tower of the Pan-American Exposition was temporary structure, its framework being of steel members with rivetted connections, and is covered with wooden lath and studs to support the surface of the walls. All the floors are steel beams and girders filled in solid with concrete slabs. The column foundations are at an elevation of 23 feet, and the floor 234 feet above foundations; the tower is made of vertical panels of from 15 feet to 24 feet high.

The total dead load is assumed at 1,649 tons, and the total live load at 600 tons. The maximum unit strain from live and dead loads is 16,000 lbs. per square inch, and the columns are proportioned accordingly. Where wind strains are added the unit strains are increased 25 per cent. The piers for the corner columns are made with 9 feet by 12 feet concrete footings 2 feet thick, with two 8 feet square crossed layers of 12 inch by 12-inch timbers, and another layer 5 feet square on top, to which the pedestals are secured by bolts. The pedestals have gusset plates, stiffened by vertical and inclined angles, rivetted to both flanges of the column, and to double 30-inch by 48-inch base plates  $1\frac{1}{2}$  inch thick. At the third floor level there are four plate girders each 5 feet deep and 34 feet long, which form a square connecting the tops of the lower sections of the four inside columns. Opposite the girders in the middle panels of the outer faces of the tower are four similar plate girders, each of which is connected with the inside girder by two plate girders 3 feet deep, which carry one column each of the upper framework of the tower. The other columns of the upper section which start at this level are carried directly by the columns or by the main girders of the tier. All beams and girders are web-connected; all diagonals are rivetted at intersections, and their end connections are rivetted to pairs of gusset plates which are attached to the plates on the horizontal members or are rivetted to the

umn flanges. The columns are spliced with web and flange ties as before described.

#### *Wind-bracing.*

In arranging a building for wind-brace sections, sometimes the floor plans will permit a symmetrical arrangement of the cross-section in which the wind-bracing is to be applied. Frequently, however, no such desirable arrangement is possible, and only certain sections can be utilised. This complicates matters somewhat, but careful study will usually permit a satisfactory solution of the problem. Wind-bracing in a high building performs, during and after erection, the very practical office of facilitating erection by enabling the columns to be maintained in their correct vertical position. The play of the temporary bolts in the holes is sufficient to allow a serious deviation from the vertical to occur, and with the temporary bracing of wood ties this can rarely be prevented. Departure from the vertical of 2 inches in a height of 100 feet can readily occur, and is not noticeable except when compared with a plumb-line. Wind-bracing can be made of certain lengths to fit between the columns, and requires that each column shall be in its proper place before the bracing will fit, so that no great error can accumulate.

A careful comparison of the treatment of wind forces as applied to tall buildings of to-day leads one to the conclusion that the designers differ very materially in regard to the forces to be resisted, the strength of material employed and the most efficient details of construction. A building constructed with a well-proportioned iron frame should be safe, if provided with check partitions, or if the base is a large proportion of or equal to the height, or if the exterior of the iron framework is covered with well-built masonry walls of sufficient thickness, for the rigidity of the solid walls would exceed that of a solid frame to such an extent that, were the building to sway sufficiently to bring the bracing into play, the walls would be damaged before the rods could be brought into action. Hence the stability must depend entirely either upon the masonry or on the iron framing, and in veneer buildings, which are being particularly considered, the latter system of bracing the metalwork must be used, with the walls as light as possible, simply enclosing the building against climatic and injurious forces. Each building offers its own peculiar conditions to the carrying out of efficient wind-bracing, and many factors must be considered in a judicious solution.

The height, width, shape and exposure of the structure, as well as the character of the enclosing walls, will determine the amount of wind pressure to be provided for, while the details of construction, the internal appearance and the planning of the various floors will largely influence the manner in which the bracing is to be treated.

Wind-bracing must reach some solid connection at the ground. It should also be arranged in some symmetrical relation to the building outlines.

The shears are undoubtedly reduced to some considerable extent through many practical considerations, having regard to the dead weight of the structure itself, the resistance to lateral strains offered in the stiff lateral rivetted connections between the floor system and the columns; the stiffening effects of partitions (if continuously and strongly built) and linings, coverings, &c., all tend to decrease the distorting effects of the wind pressure.

Assuming that stiffness against side yielding alone is necessary, place floor girders as struts with the columns as chords. 30 lbs. per square foot wind pressure the panel load equals 300 lbs. Considering the protection afforded by neighbouring buildings, the point of application of the resultant wind pressure will be taken at say two-thirds of the height of the structure above ground. The total shear will then equal about 6,000 lbs., or 30 tons.

The moment of the resultant wind pressure  $= 30 \times 118 = 3,540$  foot-tons, and this divided by 24 gives  $147\frac{1}{2}$  tons tension in the windward foundation. The vertical component of the resultant diagonal  $= 16.8$  tons, leaving a compression of, say, 11 tons on the leeward column. The dead weight, including masonry, walls, floors, filling, &c., will equal about 250 tons for one building, while even for a building with no filling or partitions completed, the dead weight is still some 200 tons, thus rendering anchorage unnecessary.

#### *Exterior Walls—Piers.*

Exterior piers which carry their tributary floor and roof loads; besides, the weight of walls themselves is capable of at least three separate treatments, each suited to its own peculiar circumstances. 1. Where the outside piers are constructed entirely of masonry carrying all the wall, floor and roof loads, which come upon them by means of masonry alone, such construction is used in buildings of moderate heights, and constitutes the ordinary type of building. The objection to such piers of solid masonry are threefold, where structures are higher than, say, sixteen storeys, viz.:—

(a) The modern requirements of plenty of light and air in all offices demand that the windows be broad and numerous and the piers narrow. In the highest buildings of the present day hardly any masonry construction is strong enough to carry the necessary roof and floor loads besides its own weight for so great a height and with so small a cross section as is desired. (b) The second objection to such large masonry piers is that they take up too much valuable renting space, and where the rent of offices is proportioned at per square foot this becomes a matter of no considerable importance to the owner. Also, the weight of these solid masonry piers would so add to the load per square foot that many of the most remarkable examples of architectural engineering would be well nigh impossible.

2. The second treatment of which the exterior piers are capable is that in which metal columns carrying the tributary floor and roof loads are placed inside the masonry piers, while the latter support themselves and the "spandrels" only. The spandrels constitute those portions of the exterior walls lying between the piers and over and under the window spaces.

3. The third method of constructing the exterior piers is the one more approved at the present stage of architectural engineering; the one which has undoubtedly opened up the means for building the highest structures. In this all the weights are thrown on the metal columns, which, in place of solid piers, are surrounded with a protective shell or covering only, made of ornamental terra-cotta or brickwork securely anchored to and supported by the columns at the various floor levels. This construction undoubtedly gives the minimum weight per foot of height and makes possible such small piers as are indispensable for light and desirable offices.

The increasing value of ground space, the demands for rapid construction and the necessity for the lightest possible loads on the subsoil have all contributed to the success of this type. Architectural effect contemplated by the designer, in his arrangement of the material, and consequently general descriptions of spandrels, can hardly be given as applicable to general practice.

The spandrels are supported by the masonry piers where such wall-bearing piers are used, or in the "veneer construction" by the metal columns in the walls. The face of the spandrels may be "flush" with the piers or "in reveal," that is, set back from the face of the piers.

Whatever be our views with regard to these gigantic structures, whether we look upon them charitably as necessities of the time, or condemn them as hideous and vulgar monstrosities, the fact remains that the number of them increases, and we do not think it possible for any one to help admiring, either from an architectural or an engineering point of view, the skill and ingenuity displayed in their construction and the daring boldness of their conception. They may not be beautiful, but at least we may suppose that they are useful, or hard-headed Americans would not continue to build them. Where every square foot of ground has a very high value they enable a certain available area to be multiplied twenty, thirty or perhaps forty, fifty or even sixty times, thus giving facilities for a like financial increase. If they teach us nothing more, they at least show that the architect and engineer can work together so as to produce results which probably neither of them could achieve alone. This is a lesson which in our country we seem slow to learn, but which, if we could but take to heart and act upon, would probably result in adding beauty and security to our structures, whereas at present some of our engineering works justly merit the architectural "finger of scorn" being turned upon them, while the structural attempts of many architects invite the profane ridicule of engineers. Until this lesson has been learned we cannot achieve that measure of success, either architecturally or from an engineering standpoint, that is possible.

The questions to be decided in these modern structures are so numerous and the difficulties so great, that it has become almost a necessity that the work should be specialised, and so it comes about that an architect is made responsible for the general arrangement of the building and for what we may call the clothing of it, while the steel frame or skeleton is the work of a skilful engineer experienced in such matters. There are few architects capable of undertaking both the architectural and the structural details of these buildings, and in some cases where the experiment has been tried the result has been disastrous, for it is manifestly impossible for one man to be able to properly master both branches of the art sufficiently to enable him to meet and overcome the many difficulties to be faced in a way that is possible when specially trained minds are employed to carry out each section.

The field is surely sufficiently wide to prevent any conflict of interests from being felt, and yet how unwilling is each at times to concede to the other his deserved position. So long as engineers continue to put up structures hideous to a degree in important positions, the necessity for the help of the architect is manifest.

Design and construction are not synonymous terms, as has been proved over and over again; and when we consider the

vast size of some of the high buildings in the States, the amount of capital they represent, and the number of lives depending on their stability, the Americans show their wisdom by bringing to bear in each department the highest specialist knowledge they can command, for by so doing there is no doubt they attain their desired end more quickly, with greater economy, and with an assured safety that would otherwise be lacking. In the old days the architect was sufficient in himself, but now every year he becomes less able to cope with the structural difficulties that enter into modern building work. Therefore the sooner it is recognised that he must obtain help from the engineer, and the engineer from him, the better will it be for all concerned. With all our pride in the achievements of modern architecture and engineering, as exemplified in the construction of the modern high business building, we must not forget that structures equally tall, or even taller, have been reared in former generations, and demonstrate by their continued existence that there were long before our day architects and engineers whose command over the materials and forces which make for stability and permanence of structures was at least equal to our own. Yet these ancient structures are altogether unutilitarian, and could not have been otherwise, by reason of the absence in the day of their erection of means of lifting great loads to great heights in quick time and at small cost.

#### Roofs.

The Buffalo Savings Bank is located at the corner of Main, Huron and Genesee Streets, in the heart of the 'Buffalo' business district, and occupies a rectangle of about 75 feet by 69 feet, with a triangular extension 56 feet long on one side. The building is occupied exclusively by the bank, and consists of a two-storey main rectangular part, about 130 feet high, and a three-storey wing, about 50 feet high, on the triangular extension of the plot. In the main part of the building the banking-room, 65 feet high, occupies most of the floor space. It has an area 59 feet square, unobstructed by columns, and surmounted by a domed ceiling supported on an octagonal steel framework; between same and the outer walls are galleries, stairways and corner rooms. Above the dome there is a steel platform supporting an octagonal office storey, 11 feet high and 70 feet wide, which is surmounted by a domed roof 53 feet 6 inches in diameter and 33 feet high above the horizontal ceiling.

The New York Clearing House on plan is an irregular St. Andrew's cross, inscribed in a trapezoid with sides 80 feet to 93 feet long. The floor-beams and girders are supported by the walls and by thirty interior columns, and the lower six tiers are continuous across the whole area of the building. In the centre of the building six columns are arranged on the side of a 30-feet by 40-feet rectangle, and extend up only to the fourth floor or sixth tier, above which there is a clear space under a dome 60 feet 6 inches in diameter on the outside of the framework.

The dome has a nearly hemispherical exterior surface, and is supported by an octagonal arrangement of web-connected plate girders. It rests on each of these girders, and immediately on 20-inch rolled beams across their angles, which form with them a sixteen-sided polygon. The girders are supported on the tops of the columns at the angles of the octagon except on one side. Here the 16-feet side of the octagon is the middle part of a 47-feet rivetted truss, which carries the ends of the adjacent girders, and is supported on special columns. This truss has a double-triangular web system, with all connections rivetted. The tension diagonals are flat plates; the bottom-chord web-plates are 18 inches deep, and the fourth storey floor beams are connected to the webs.

The end vertical members of the truss are practically continuations of the columns that support it. These columns are spliced at every storey with four web-plates. The bottom of the lower section has eight vertical connecting angles rivetted to the vertical web stiffener plates of the extended base, the base being  $5\frac{1}{2}$  feet square, with eight vertical web stiffener plates and four knee-brace angles on the main diagonals to stiffen the corners. Other columns have bases  $3\frac{1}{2}$  feet square, which are similar to these except that the knee-brace angles are omitted, and some of the lighter columns have 2 by  $5\frac{1}{2}$  feet bases stiffened with a pair of plates, which virtually make them double-web girders.

There are sixteen radial dome trusses, seated on top of the polygonal framing of girders, and having their top and bottom chords rivetted at the centre to a pair of horizontal circular steel plates 6 feet 4 inches in diameter. Each truss is made in two sections, rivetted together through the flanges of web members, which are perpendicular to the dome surface. Trussed purlins 6 feet deep are connected to the trusses in the planes of these members, and support at their centre points intermediate curved rafters extending to the foot of the dome. The trusses are also connected by horizontal circular T-bars rivetted to their top and bottom chords, to support the roof and ceiling respectively. The horizontal reactions at the lower ends of the radial trusses are provided for by a circular vertical

steel plate like a hoop around their feet. Mr. R. W. Gibsc was the architect of the building.

The armoury roof of the Forty-seventh Regiment, Brooklyn is 300 feet by 197 feet on plan, and square-hipped about 32 feet high at the eaves and 90 feet at the ridge. It has four uniform planes, those of the two sides intersecting in a longitudinal ridge line about 104 feet long, which terminates at junction hips. There are four main transverse centre roof trusses of span of 191 feet 4 inches, centre to centre. From the centre of each of the end ones radiate two hip trusses extending to the corners of the building, and one longitudinal truss to the middle of the end wall. Each hip truss also supports two pairs of short trusses parallel to the main trusses. The main trusses are three-hinged arch ribs of 84 feet rise, seated on piers extended from the inside faces of the side walls just below the floor level. Their intrados is a continuous curve from the floor line at the skewback to the crown; the extrados is a curve of larger radius than that of the intrados, so as to give the truss a depth of about 15 feet at the haunches and 5 feet at the crown.

The trusses are built entirely of angles and plates, and have T-shaped top and bottom chords and X-braced web members. The horizontal thrust is taken by a pair of eye-bars connecting the skewback pins under the floors. The hip trusses are similar to the semi-trusses of the main spans, and the short corner trusses conform to the general design of the large ones. The vertical ends of the trusses are connected by horizontal struts at mid height and by light, deep, inclined lattice girders at the haunches. The top chords of the trusses are connected in each roof surface by six trussed purlins of about 34 feet span, each panel of which supports six lines of wooden rafters. The roof is also braced by diagonal rods in alternate panels of the main part, and in the centre panels of the end where most of the rafters are omitted to avoid confusion.

The depths and seats of the purlins are so arranged on the curved top chords as to set the rafters in three straight lines forming successively decreasing angles with the horizontal in the three sections from the eaves up to the ridge. A clerestory is thus formed at the foot of each rafter, and glazed with pivoted sashlights, affording light and ventilation. Horizontal latticed girders, with vertical webs, are built in the lower part of the ends of the trusses and support cantilever brackets, carrying the gallery around both sides and one end of the hall. The arch ribs and bottom chord-bars are pin-connected, and the short trusses are connected to the hips by bent plates and angles. The trusses are seated on massive cast-iron pedestals, each anchored and built into the masonry which react on bottom-bearing plates.

#### Colchester Town Hall Roof.

The roof over the Moot Hall, about 100 feet by 40 feet, constructed with seven principals, the ends of the roof being hipped. The high pitch and the conditions to be complied with necessitated nominally two different systems of trussing. There are two pairs of principals placed 3 feet  $1\frac{1}{2}$  inch centre to centre. This method was adopted to carry the fire and ventilating flues from the lower storeys up to the chimney-stacks that are placed on the front slope and near the ridge line, the flue pipes in same being embedded and surrounded in concrete. Sealing angles and connecting plates are rivetted on the intrados of the principals to receive the wood purlins or framework for the barrel-vaulted ceiling. The principals are made of double angles 4-inch by 3-inch by  $\frac{3}{8}$ -inch and  $\frac{3}{8}$ -inch web plates in the lower part or legs, well stiffened and rivetted together. The hip rafters are also made of plates and double angles, so as to receive the purlins and other framing. These principals bear upon the front wall masonry and in the opposite wall upon specially built steel stanchions to which they are rivetted. These stanchions stand upon steel plate girders at Moot Hall floor level, the girders being supported by compound stanchions made up of joist and plates, and extend to below the lower basement floor level. The purlins are  $3\frac{1}{2}$ -inch by  $3\frac{1}{2}$ -inch  $\frac{3}{8}$ -inch angles, and trussed, to which are bolted the wood purlins that receive the roof boarding.

#### Henley Town Hall Roof.

Henley Town Hall roof is constructed with six steel principals, Mansard-shaped outside of extrados, and semicircular on intrados. Each principal was made in three sections for convenience of transit (the span being 40 feet). They are bolted on the radial line at the junction where the sloping roof meets the horizontal. They are made of tees, angles, bars and plates rivetted together. Angle seatings and cleats are provided on the intrados to receive the purlins or the principal framing.

#### Electra House, Finsbury Pavement.

Reverting to what has been previously said respecting the minimum size of piers and superimposed loads, I may call attention to the conditions that had to be fulfilled in this building. The front walls are carried upon stanchions within the

ite piers, they (the granite piers) not being of sufficient area to support the superincumbent load. These stanchions, together with the loads previously mentioned, also support the divisional walls and chimney-breasts late girders from first-floor level to above roof.

Mr. A. T. WALMISLEY, in a letter which was read, said he regretted he was unable to be in London to attend the meeting. He thought there were many structures where an engineer might profitably engage the services of an architect for the artistic portion and general arrangements of interiors, as well as elevations, but that the structural parts to be designed by an engineer should in every case claim the precedence and control the outline of design. Some of the London bridges are good examples. In the arch of Westminster Bridge an engineer knew that no diagram of stresses in ironwork gave a true curve there adopted for the arch. In the iron parapet of the Victoria Railway Bridge across the Thames an engineer was in admiration, because the design could not be made in any other way.

Mr. W. E. RILEY, superintending architect to the London City Council, sent the following notes on the height of buildings:—Looking recently at some views of Lower New York, they seemed quite unfamiliar to me, although I have been there frequently up to thirteen years ago. The erection of numerous high buildings has brought about this great change. The narrow tongue of land between the East and West Rivers, with the Harlem River on the north, particularly hampers extension laterally, and thus was evolved in the resourceful American mind the expedient of carrying up buildings to great heights. In these buildings the steel skeletons are the only portions of the structure which are attached to the foundations, and they provide the reactionary support for the weights of the building, each storey being carried independently of the one above or below it. The cubical contents of some of the high buildings in New York must necessarily be very considerable, especially in comparison with London buildings, where, as is well known, special permission is necessary to allow buildings of the warehouse class of a greater cubical extent than 250,000 cubic feet, in which cases the buildings must not exceed 60 feet in height nor be of a maximum capacity of more than 450,000 cubic feet. I recently attended a congress at the Paris Exhibition, and noted that some of the continental speakers drew some very forcible conclusions as to the height permitted for buildings in London, but the horror with which he spoke of buildings twenty-two storeys in height in New York was quite indescribable. These are representative of the views, because in Europe buildings are not governed by the geographical conditions which obtain in New York city, although this consideration does not apply to other American cities where similar high buildings are erected. But it must be borne in mind that American cities have been laid out on modern lines, with the special advantage of enjoying a maximum of sunshine, whereas in London the small amount of sunshine must be regarded as a factor in determining the height of buildings in relation to its open spaces. The newest building code of New York city, which came into operation in October 1900, is an interesting document. In its provisions it is noticed that any hotel, lodging-house, school, theatre, goal, police-station, hospital, asylum, or institution for the care or treatment of persons which exceeds a certain height shall be built fireproof, and every other building which exceeds 75 feet shall be similarly constructed.

A recent book on fireproof construction ("How to Build Fireproof Buildings" by Francis C. Moore, New York, 1899) there are recorded some very interesting experiences on the behaviour of buildings in cases of fire. Illustrations are given of the Home Life building. It is 192 feet high, and was intended to be fireproof. A building of five storeys adjoining it took fire, and burned out every floor of the Home Life building above the ground height. The disaster appears to have resulted through a narrow court 20 feet wide, used for lighting the higher building, drawing up the flames and communicating them from one window to another in the progress of the fire in the higher building. The court acted like a chimney, and a poorly constructed chimney in its destructive effect, how a reputed fireproof building burned so freely and so completely is not so apparent. The subject of high buildings is of great interest, and its developments are being carefully studied. Many experts in New York city are bitterly opposed to high buildings, and they freely condemn the result of recent work as a hideous disfigurement of the city. These views find many supporters here, but perhaps a better acquaintance with the conditions which are responsible for the problem would soften the criticisms. American engineers and architects are hampered by no insurmountable traditions. When a city has a necessity it was not put in an underground position as in London, but erected on stilts, and it answers its purpose very well. When a luxurious ship was wanted for the River traffic, the *Pilgrim*, probably out of date by this time, was evolved. Her beam engines and other features

appeared antiquated twelve years ago, but a closer acquaintance with the conditions revealed that the type adopted had much to recommend it. The systematic method of American thinkers has been to first grasp the difficulties to be overcome, and then attempt to solve the problems in the most practical and common sense way, unbiassed by prejudice. If the tall building is not all that can be desired, it is another effort to solve a difficulty, and as experience is gained, it may ultimately lead to some satisfactory result in America, but it does not seem a suitable form of structure for this part of the world.

Mr. LEWIS SOLOMON, who had been invited to attend the meeting, sent a letter regretting his absence. He agreed with Mr. Cunningham that few architects were capable of undertaking both the architectural and structural details of a tall iron building, but the architect should design the system and leave the details to be filled in by the engineer. With regard to roof construction, the paper led one to believe that iron domes were almost a new feature, but they were not so. He wrote, he remembered, over thirty years ago, when he was connected with the design and carrying out of the Ottoman Bank in Throgmorton Street, that there was an iron dome to the board-room, the ironwork of which was designed by Mr. Homan (now of the firm of Messrs. Homan & Rodgers), but the architectural work was not done in any way by the engineer. He did not quite understand why reference was made at the end of the paper to the Electra House, Finsbury Pavement, as there was no special engineering question concerned in a matter where the architect had adopted an ordinary form of construction, viz. bedding stanchions inside masonry.

## THE DESIGNING OF CITIES.\*

(Concluded from last week.)

### Theory of Aspect.

AS stated in a report by Messrs. Mansfield, Vernon, Barlow and the writer to the Commissioner on Sites for the Seat of the Government of the Commonwealth, the most favourable form for picturesque effect in a site would be a gently undulating surface, surrounded by commanding hills, constituting a sort of semi-amphitheatre. The desirable aspect in relation to the cardinal points will depend very much on local peculiarities, such as the climate, the prevailing direction and character of the winds, and similar meteorological factors. Consequently it is hardly possible to generalise in respect thereof. So far as mere sunlight is concerned, eastern slopes are cooler than western, and southern than northern; consequently north-western slopes are to be preferred where heat is desired, and south-eastern when the opposite is the case. These effects may, however, be greatly modified by other factors.

In a city set out on the rectangular-radial system, almost every possible orientation in respect of individual blocks exists, and if the site be also undulating, choice of aspect in such a system can offer no difficulty because of its multitudinous variety. So that whether industrial or other requirements demand the presence or absence of direct sunlight, those requirements are easily met. Buildings in which it is necessary to secure the maximum penetration of solar rays, so as to benefit by their heat in winter, and the minimum penetration so as to avoid the heat in summer, should so far as the geometry of solar shadows is concerned, have their long axes east and west in southern latitudes and their windows on the north face of the building. Since, however, the temperature reaches a maximum after noon through the cumulative effects of the sun's heat rays, the axis should, theoretically, be rotated slightly, so as to turn a little to the north on the east side, therefore a little to the south on the west side. The amount of this rotation can be ascertained by taking account of the difference between the apparent noon and the times of maximum temperature, the differences between the noon and maximum temperatures, and the latitude of the place considered, the discussion extending over the changes for an entire year, so as to properly integrate the effects, and hence deduce their mean. The necessary rotation will, however, not greatly modify the east-west position for the axis. The designer must, it is evident, take account of these necessities, and for buildings of a large size and requiring spacious grounds, where aspect is important, as, for example, hospitals, sanatoria, &c., provide suitable blocks.

### The Aesthetics of Design.

A study of those examples of architecture which impress the human consciousness with a sense of beauty has revealed the fact that their general proportions and the mutual relation-

\* A paper by Mr. G. H. Knibbs, F.R.A.S., read before a joint meeting of the Institute of Architects and the Institution of Surveyors, New South Wales, and published in the *Building, Engineering and Mining Journal*.

ship of their details conform to simple numerical ratios and to an harmonious scheme. These ratios, spatially realised in the cube, square, the plane or circular equilateral triangle, the 3, 4, 5 triangle, the sphere, cube, pyramid, &c., are geometrical forms that constitute, as it were, a skeleton on which architectural features are developed in symmetrical grouping, with, however, such relief in detail as to obviate too cold and severe an effect, or what may perhaps be called an appearance of excessive symmetry. The proper subordination in the various parts of structures of their mass effects is also essential to awaken that impression of stability and repose which, together with grandeur of form and beauty of outline and the grace of harmonious ornament, constitute the ideal of architectural design. These matters require the professional attention not only of those charged with erecting the buildings of a city, but also of those whose function it is to design its streets and general arrangements; the latter can by no means neglect them. Without a knowledge of and attention to æsthetic laws, it is impossible to exhaust the artistic possibilities of a site, and the difficult task which falls to the lot of the designer is to reach a distinct conception of them as he studies the contours on a plan of the site. Direct study of its features on the ground alone is not likely to satisfactorily reach the end in view.

Among the elements the designer has to consider are the picturesque effect of masses of foliage, the perspective appearance of monumental buildings and monuments from the points of view where they will be prominently seen, the grouping of buildings and classes of buildings, the effective position for parks, gardens, &c., the spatial provision necessary for the proper viewing of all features of interest, and so on; for it is by attention to such elements that the possibility of beauty is created and the picturesque capabilities of the site are exploited. Thus eminences and concave surfaces, both of which lend themselves to striking effects, should be exhaustively studied in relation to the general scheme.

#### *Sites for Monumental Buildings and Monuments.*

The two classes of site that give the necessary prominence to monumental buildings are the summits of hills and the centres of amphitheatres—the one bringing a building into relief against the sky, the other showing it in relation to its surroundings. In both cases the preservation of space about the building greatly enhances its effect by insuring for it a sufficient distinctness. Remembering that a considerable time must elapse before any great city can be completed, the reservation of sites for future public buildings and requirements generally and for extension of buildings as the necessity arises, should always be on a most liberal scale, as this not only avoids the need for costly resumptions of land, but also enables the æsthetic effect to receive that adequate consideration which they rarely do if the element of cost is serious.

The spatial provision for monuments intended to be of noble proportions would be appropriately located at prominent radial centres, and for those of lesser size, relegated to more unpretentious positions. It is, of course, important that the magnitude of monuments should harmonise with their surroundings; and as the form they may be expected to take depends very largely upon the contingencies of the future, the spatial provision should be liberal. The essence of the whole matter is that all conspicuous or prominent sites should be appropriated for those great public buildings and monuments upon which a people may be expected to lavish its wealth and artistically express its national feeling. The fact that for a long period we shall be unable to create any great monuments is likely to make us forget the necessity of providing for them; hence the need here for more than ordinary care, for absence of the proper provision is practically irremediable. The scorn which men of large ideas receive at the hands of their contemporaries must not be allowed to wither up our conceptions of the ultimate needs of a great city.

Monuments of all kinds, in order to be effective, must be conspicuous. In order, therefore, that they may be properly seen, an unobstructed area must be preserved immediately round about them. For viewing detail, an onlooker would stand at a distance from the monument about equal to its height; to see it as a whole, at a distance about twice its height; to see it with its background and immediate surroundings, at, say, three times its height; and to see it with its general surroundings at a still greater distance. It is necessary, therefore, that about every monument the unobstructed space should be between a distance equal to its height and that equal to at least three times its height. Similar monumental buildings of noble proportions should stand back a sufficient distance from the street to admit of their being favourably seen.

#### *Treatment of Streets from the Standpoint of Æsthetics.*

Owing to the fact that great lengths of street, especially when unvarying in width, of similar section and fairly level, produce on the beholder a sense of wearisome regularity, the introduction of spaces for monuments, large street fountains,

water-jets, foliage squares, &c., at such points as relieve view, is a desirable corrective. It is hardly possible to lay down any rule as to the length which may be unrelieved because so much depends upon grade, width and general treatment in other respects; a length of from fifteen to twenty-five times the width might be taken as a general indication. Tiresome uniformity can also be avoided by subjecting the street to independent treatment, so that each may possess some characteristic. Even alteration of width is preferable to excessive symmetry, and may be introduced to counteract unæsthetic effect.

The undisguised presence of telegraph wires, telephone cables, &c., besides being unsightly, is a menace to public safety in cases of fire. Overhead electric wires in a system, although perhaps less unsightly, are inconsistent with a fine effect, and might well be transferred to underground conduits, as has already been done in some instances.

It has been said that monuments, so, too, foliage squares may be employed as a relief to street uniformity; they also be introduced to obviate the ugly effect which results from the disappearance of buildings, &c., over the summit of streets crossing a ridge; for in no case should the effect be unrelieved. Their proper situation is, of course, central, the traffic passing on either side on a sufficient width provided therefor.

If monuments be erected in curved streets the concave side of greater radius is the proper side, forasmuch as it gives the greater area of visibility, and moreover forms an effective background, as is evident on viewing figures in niches. A convex background is less effective than even a flat background, to nothing of the reduction of the area of visibility.

Among things susceptible of artistic treatment in the arrangements for lighting may be mentioned. Not only may lamp posts and candelabra be so designed as to enhance the beauty of streets, but permanent installations, such as would admit of more frequent illuminations, of streets and buildings, may well be a feature of any new town. The cost would be but little greater than that of individual illuminations. In streets planted with trees the effect could be made most pleasing, and the wanton injury to their form common on such occasions, would be wholly avoided. These matters are easily dealt with in the development of design, and should not, as is usually the case, be an afterthought. It would not be difficult to improve the character of drinking-stands, pillar-boxes for letters, telephone fire alarms, conveniences and other furniture of modern streets.

Among places admitting of decided improvement as to the usual treatment, may be mentioned street intersections. Where the blocks have acute angles, a sufficient cut-off to a façade or a suitable rounding off greatly enhances appearance, and even the intersections of rectangular blocks may be subjected to similar treatment. The cutting off of corners increases of course the diagonals at the intersections, and since the sidewalks or footpaths follow the outlines of blocks (i.e. are equidistant from the building lines) increased diagonally also the roadway proper. This enlargement of room for street ornamentation at the intersections of the building lines. By making the cut-off of corners adequate, provision may be made for a small square, a monument, cluster of foliage, or small garden. A still greater cut-off will give a central square, circle or ellipse of finer proportions, roadways round it, and which may be utilised for a pretentious central feature, and the independent treatment of every intersection will produce a gratifying result.

In addition to those at street intersections spaces are desirable in front of, and in some cases even on three sides of certain types of public buildings, especially those in which architectural elaboration would not normally be restricted to the front, as, for example, museums, theatres, churches, Arcades and approaches thereto are features which, since they can be made very effective in appearance, ought to be provided for in the design; and further, sites should be indicated for those fine pieces of sculpture or architectural art which are the artistic sentiment of any cultured people will eventually realise. Since all artistic elements must stand in harmonious relationship to one another, and their distribution be such as to give them a maximum efficiency in relation to their influence in beautifying the city, they ought all to be considered in the original design, so that the necessary provision may be made. The usual practice of either entirely neglecting, or inadequately regarding these matters and then doing the best possible with the sites that chance to be available, can never be satisfactory, as is obvious when one contemplates the all too common and less disfigurement of what were originally ideally perfect sites.

#### *Public Parks and Gardens.*

Public parks and gardens are not only an ornament to a city but a necessity to its people, if their health is to be regarded, and considerations of health and beauty may be said to have weight in important cities. Hence we are justified in making liberal provision for public gardens. Irregular sites

be preferred as giving the landscape gardener greater for displaying his art and as possessing intrinsically charm. In selecting areas for public gardens therefore regular tracts would always be chosen, provided other of the design could be made to accord therewith, and pro- also that the positions lent themselves to good effects very point of view. Whole blocks, or even double, or quadruple blocks, containing suitable features might be devoted to the purpose, the distribution over the site being made fairly uniform, and adapted to the character of the surroundings.

ides these gardens and smaller parks, in the city proper, parks also are necessary for its environs. The Bois de ne and the Bois de Vincennes, of Paris, have each an over 2,000 acres, and liberal provision should similarly be in the general arrangement of the Federal capital. Parks would form recreation grounds for the citizens of ital; and their area ought to be ample for the ultimate tion.

ere natural lakes do not exist, it is desirable to create l ones, and if the water supplied to them were, on its e, passed through large fountains of many jets, not only he feature be very attractive, but the water itself would well aerated. By suitably selecting the path for the s conveying this water, it could in some cases be made e either all or most of the fountains of the city, passing itation from one to the other, subject only to the loss by ation at each fountain.

ay be here excused for repeating a suggestion made to onversation by the Commissioner appointed to report on- es for the Federal capital. If the parks were thickly l with trees whose foliage was beautiful, and whose t at the same time was of value, then when the demand fuller use of the parks arose, necessitating clearing, the ould have become a valuable asset, and the income he timber available for removal might be made to ally assist in the more elaborate development of the . Another suggestion made by the same gentleman is e parks might to some extent illustrate the types of to be found scattered over the face of the earth, not by al specimens, but by creating small forests of such

#### Hygienic Elements of the Design.

s not only in the choice of a site that the elements con- to health need to be studied. However wisely the ay have been made in respect of climate, of the nature surface and subsoil, of the condition of the discharge of -waters and the position of the ground-water, of the lities of adequate water-supply and efficient drainage, till remains a need for a hygienic as well as æsthetic of the localisation of settlement. And since this reacts e whole question, it is not possible to omit the hygienic ts in elaborating a design that is to be as perfect as our dge will allow.

e first great requisite to general health is the prevention settlement on those parts of a site where undesirable conditions prevail. For example, neither residences tories should be allowed to be built or established in ions or other places where the moisture is excessive, or water is liable to accumulate in heavy storms. A com- efence against the liability to misapplication of such s the converting of them into parks, and planting with f vegetation that make a maximum demand upon the le moisture. By planting and draining, an area can be ransformed both in character and appearance, as the of the city of Washington, U.S.A., so well demonstrates, unsightly feature may be converted into one of beauty. e second requisite is that so far as possible variations in igh permit, those should have weight which lend them e to convenient and efficient drainage systems, both for waters and domestic, industrial and other polluted e; and the outlines of the scheme for this should there- fully considered when the design is being developed t afterwards.

e third requisite is that the total quantity of breathing- provided in the design should be large, the vegetation abundant, and when the building stage is reached, the ry sanitary provision enforced for every structure, over- ng being prohibited by requiring a sufficient number of etres of space to each inhabitant.

Among the most important of the hygienic elements I place that of ample provision for play or recreation s in connection with every school, college or other onal establishment—i.e. a complete abandonment of the niggardly notion of what is a reasonable provision in spect. That the recreation of a people should be under sit and healthy conditions is always important, and ore so than in the case of the young, so that the grounds of a beautiful city should in themselves be a of attraction, and exhilarant in their reaction upon those e them.

Similarly, hospitals and sanatoria should have bright sur- roundings and pleasant aspects, for the cheery and tonic effect of these is by no means the least potent of the remedies avail- able to those charged with the care of our health.

The suitable location of industrial occupations which are either noxious or unpleasant, even in a minor degree, is a matter of importance in enhancing the merits of a city, and in dealing with those occupations as they arise, all provisions for diminishing their mischief should be enforced. For example, since a smoky cannot be a beautiful city, at any rate in the highest sense, all smoke in factories ought to be consumed. Where industries are such that they cannot be ameliorated, they can be excluded from the city proper. Therefore provision for abattoirs and similar establish- ments are preferably omitted. These and similar malodorous occupations can be concentrated at some convenient but suffi- ciently distant point, for though they may not directly create sanitary mischief, their reaction upon human beings is un- favourable, and they are therefore undesirable.

#### OWNER'S RESPONSIBILITY FOR PAYMENT OF PROVISIONAL SUMS.

IN the Court of Appeal on the 17th inst. the appeal cas<sup>e</sup> Hobbs v. Turner was heard. According to the report in the *Times*, the plaintiff, who was a metalworker, sued the defendant, a building-owner, for 27*l.* 10*s.*, for metalwork supplied for a house which the defendant was having built for him by a builder under the supervision of Mr. J. L. Williams as architect. The contract under which the house was being built was made in September 1898, and was in the form settled and issued by the Royal Institute of British Architects. By the contract the builder, in consideration of a sum of 4,700*l.*, agreed upon and subject to the conditions in the schedule to the contract to execute and complete the works described in the specification. Payment for the work was to be made by instalments as the work progressed, according to the certificate of the architect. Clause 28 of the contract, so far as material, was as follows:—"The provisional sums mentioned in the specification for materials to be supplied or for work to be performed by special artists or tradesmen, or for other works or fittings to the building, shall be paid and expended at such times and in such amounts and to and in favour of such persons as the architect shall direct, and sums so expended shall be payable by the contractor without discount or deduction or . . . by the employer to the said artists or tradesmen. The value of works which are executed by the contractor in respect of provisional sums, or in additional works, shall be ascertained as provided by clause 13. At the settlement of the accounts the amount paid by the contractor to the said artists or tradesmen, and the said value of such works executed by the contractor, shall be set against all such provisional sums or any sum provided for additional works, and the balance shall be added to or deducted from the contract sum." The specification contained this clause:—"Provide and fix iron balcony railings to design (allow 20*l.* for this irrespective of carriage, fixing and profit)." It was not suggested that there was anything in the specifi- cation to alter the legal rights of the parties. The archi- tect selected the plaintiff as the person to supply the ironwork for the balconies, and the builder asked the plaintiff to send designs to the architect, who rejected them, and sent the plaintiff his own designs; and the builder having given measurements and quantities, the ironwork was sent to him (the builder) and the goods were invoiced and debited to him. Later on, in November 1899, the builder wrote to the plaintiff asking him to send him his account, and he did so; but on December 9 the builder wrote saying that the architect would certify the amount direct to the building- owner (the defendant), and on December 14, 1899, the architect sent to the plaintiff a certificate addressed to the defendant certifying that the plaintiff was entitled to be paid 27*l.* 10*s.* for the ironwork. This certificate the plaintiff sent to the defendant, who kept it, making no reply. After this the plaintiff sent two or three times to the defendant for the money, of which the defendant took no notice. In October 1900, when the plaintiff's solicitor wrote for payment, the defendant repudiated liability. The defendant alleged that he had a claim against the builder for bad work. Mr. Justice Kennedy gave judgment in favour of the plaintiff. The defendant appealed.

The Court dismissed the appeal. The Master of the Rolls said that, in his opinion, the appeal should be dismissed. The contract was one which was not an unusual one at the present time, namely, the builder undertook to do certain portions of the work, and as to the other portions of the work provisional sums were specified. The specification contained this clause:—"Provide and fix iron balcony railings to design (allow 20*l.* for this, irrespective of carriage, fixing and profit)." That threw them back upon the

original central undertaking of the builder contained in the contract and the conditions. In consideration of the sum of 4,700*l.* the builder agreed to execute and complete, subject to the conditions in the schedule to the contract, the works described in the specification. In the conditions and specification they found how that lump sum was to be distributed. They found that the builder was not necessarily to execute the whole of the work, but the building-owner might get other persons to do certain parts of the work, and as against the builder certain fixed sums only were to be paid out of the lump sum to those persons for that particular class of work. It was good sense that a sum should be fixed for each class of work which was not to be executed by the builder, but by some tradesman or artist designated by the architect. The building-owner—the defendant—had a discretion as to the person by whom this class of work was to be done, and he might agree to pay him any sum he pleased, but he could only allow as against the builder the fixed sum for each class of work. That being so, clause 28 of the conditions seemed to him to contemplate payment for this class of work being made either by the builder or by the building-owner, and the last part was based on the hypothesis that part of the work might be done by the builder and part not done by him, and where any such work was not done by the builder the building-owner would be entitled to hold back the amount specified for that work. This clause was obviously framed upon the footing that the building-owner was liable for this particular class of work. In his opinion, when one looked at the whole of the contract taken together, and not relying upon any one particular clause, the proper inference as regarded this particular class of work was that it was intended that the building-owner, and not the builder, should be the principal. If the builder entered into a contract for any of this class of work he might make himself liable to the tradesman or artist; but, as he was acting under the general scope of the contract, he would be acting as the agent of the building-owner and would create privity of contract between the building-owner and the tradesman or artist. That could only be got rid of by the tradesman or artist contracting with the builder in such a way as to debar himself from resorting to the building-owner. Nothing of that kind occurred here. What happened was that the plaintiff was put into relation with the defendant through the architect, and, though this was not clear, he understood that the order was given to the plaintiff by the architect. It was true that the invoice was sent to the builder, but the architect gave a certificate against the defendant, and not against the builder, and sent it to the defendant. His lordship did not intend to say anything about the point as to estoppel, nor was it necessary to decide whether, under clause 28 of the conditions, the architect had authority to determine who was to pay as well as to whom payment should be made. It seemed to him, looking at the contract as a whole, that the initial liability of the defendant—the building-owner—in respect of this class of work was established, and that all the parties dealt upon that footing. The judgment was, therefore, right.

Lord Justice Romer agreed.

Lord Justice Mathew was of the same opinion. This was a question of fact which had been properly decided by the learned judge.

### GENERAL.

**A Bronze Statue** of the late Queen-Empress, representing Her Majesty seated on a throne in full regal state, erected at Lahore by public subscription in commemoration of the Diamond Jubilee, has been unveiled. The sculptor was Mr. Bertram Mackerrall. The Punjab Memorial Fund, which is to be devoted to placing a marble canopy over the statue, has reached a total of 3,867*l.*

**The New Opera House** at York, erected on the site of the old Exchange Hall, was opened last Monday. The building, which has cost about 24,000*l.*, was from the designs of Mr. J. P. Briggs.

**The Paintings** bequeathed to the Louvre by the late M. Thiery, of Mauritius, have been valued at over 10,000,000 frs. There are 116 works, representing the greatest French artists of the nineteenth century.

**The Local Government Board** have approved of an application from Blackpool to widen the promenade 100 feet instead of 60 feet, at a cost of about 340,000*l.* The works will shortly commence. An order for 5,000 tons of cement and 10,000 tons of basaltic rock has gone to Germany.

**The Memorial** of the late Ferdinand von Müller will shortly be unveiled in Melbourne. It consists of a column of granite with a bronze medallion portrait. Müller was born in Rostock in 1825. In 1848 he went to Australia, where he was appointed Government botanist, and in 1857 director of the Botanic Gardens.

**A Pair of Drawings** by Mr. Ernest George, belonging to the late Mr. William Lee, were sold on Saturday by auction for 16*l.* 5*s.* 6*d.* The subjects were Haarlem and St. Mark's Place, Venice.

**The Manchester Corporation** have purchased Mr. Thangue's *Gathering Plums* for the Art Gallery. The Mr. S. Pope, the Parliamentary counsel, has bequeathed *The Wreck*, by Mr. William Small, and two marble statues by Mr. J. Swinnerton, entitled *Ganymede* and *Endymion*.

**Mr. H. Bedford Lemere**, architectural photographer, has been elected a member of the Edinburgh Architectural Association.

**A Special Fund** of 1,000*l.* is to be raised in order to incite in the restoration scheme of Chatham parish church Norman arches recently discovered in pulling down a portion of the edifice for the purpose of rebuilding the old Georgian nave.

**The Louisiana Purchase Exhibition** will not be next year owing to the shortness of notice given to foreign countries. It will probably take place in 1904.

**The Freehold Site** occupied by St. Bartholomew's Church, Little Moorfields, City, embracing an area of 6,300 square feet and possessing a frontage to three thoroughfares of 270 feet has been sold for 20,400*l.*, the property being purchased by syndicate.

**Mr. J. G. Jackson, R.A.**, having been called in to examine the chancel of the parish church of Portsmouth, has ordered shoring to be immediately erected in order to prevent catastrophe.

**Mr. G. S. Mathews** will read a paper on Monday before the Surveyors' Institution on "The Final Report of the Local Taxation Committee."

**Mr. C. S. Nelson** has been instructed to prepare plans for public baths for Pudsey.

**The Guardians** of the Fylde Union are about to erect new workhouse at Wesham, Kirkham, which it is expected will require an outlay of about 50,000*l.*

**An Entombment** by Simone Martini, of Siena, has been acquired for the National Gallery at Berlin. The works of master are rare, and hitherto were only to be seen in the Louvre, Liverpool and Antwerp.

**The London County Council** have instructed the improvement committee to consider the possibilities of some "over and under" arrangement, by means of bridges or subways, or about every spot where two large streams of vehicles now perforce to wait to cross each other.

**The Prince of Wales** will open the National Physical Laboratory in Bushey House on March 19. The object of the laboratory is to encourage the application of physical science to manufactures and industry. This it will do by undertaking researches into questions of importance to either, and by the use of apparatus and material used in trade.

**The Yarmouth Port Authorities** are willing to sell cement manufacturers foreshore mud at a farthing a ton.

**The Paris Municipality** have agreed to the project of purchasing from the State the site of the fortifications to be demolished between Auteuil and Neuilly.

**The Congress** of the Sanitary Institute will be held at Manchester from September 9 to 13 next, when Earl Egerton of Tatton will preside. Section I. (Sanitary Science and Preventive Medicine) will be presided over by Sir J. Crooke Browne, F.R.S.; Section II. (Engineering and Architecture) by Sir Alexander Binnie; and Section III. (Physics, Chemistry and Biology) by Professor A. Sheridan Delpéine. Fifteen technical conferences will also be held in connection with the congress.

**Battle Abbey** continues to be open to visitors on Tuesdays and the admission fees are devoted to local charities.

**The Launceston Town Council** have taken a thirty-year lease of the castle from the Duchy of Cornwall at the nominal rent of 5*l.*, the cost of upkeep and of the gardens and pleasure walks attached to the castle being borne by the municipality.

**A Bill** will shortly be introduced by the Treasury for the acquisition of the property required to complete the site of a new college of science in Dublin. In 1899-1900 there was a vote of 13,000*l.* towards the purchase of the first part.

**The Court of Common Council** have resolved to refer the City lands committee to consider the desirability of temporarily arranging for the proper ventilation of the present building during the erection of the new Sessions House.

**The Fifth Ordinary Meeting** of the Liverpool Architectural Society will be held at 6 P.M. on Monday, February 11, in the Law Library, 41 Castle Street, Professor Simon in the chair. A paper will be read by Mr. Robert Cockerell on "The Life and Works of Professor Charles Robert Cockerell, R.A.," illustrated by lantern slides and original drawings.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**ALDERSHOT.**—March 1.—Plans are invited for laying-out as a pleasure ground about 6 acres of land in the centre of Aldershot. Mr. Nelson F. Dennis, A.M.I.C.E., surveyor.

**ALDERSHOT.**—March 29.—Competitive plans are invited for proposed public offices, fire-station and town hall for the town. Premiums of £100, £75 and £50 will be awarded for first, second and third best plans. Mr. Nelson F. Dennis, A.M.I.C.E., surveyor.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

**BATTERSEA.**—Jan. 31.—Premiums of 50%, 25% and 10% respectively are offered for the three best sets of designs, &c., of dwellings, as follows:—(a) A house of two storeys; (b) a house consisting of two self-contained tenements; and (c) a house consisting of three self-contained tenements. Mr. W. Marcus Wilkins, town clerk, Municipal Buildings, Lavender Hill, S.W.

**CARLISLE.**—Plans and specifications, with the cost of erecting suitable grand stand and offices at Blackhall new race-course by competition, are invited. A sum of £10 will be awarded the second and £5 to the third competitor. The Secretary, 15 Howard Place, Carlisle.

**GLASGOW.**—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100%, 50% and 25% respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

**HULL.**—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100%, 60% and 40%). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

**ISLE OF WIGHT.**—Jan. 31.—Designs are invited for a suitable monument as a memorial to Her late Majesty, to be erected in St. James's Square, Newport, Isle of Wight. A premium of 25% is offered for the accepted design. The Secretary, Isle of Wight Queen Victoria Memorial Committee, 20 Holyrood Street, Newport, Isle of Wight.

**IRELAND.**—Feb. 26.—A premium of £20 is offered for the best and cheapest report, plans, specification and estimates, &c., for providing the town of Kanturk with a wholesome supply of water. Mr. Mt. Timothy Guiney, clerk to the Kanturk Rural District Council, at the Boardroom of the Workhouse.

**LANGHO.**—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200%, 150% and 100% respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**LIVERPOOL.**—Jan. 31.—Applications are invited from architects willing to submit designs in a limited competition for rebuilding the Liverpool Infirmary for Children. Colonel C. Forbes Bell, Eagle Chambers, 17 Fenwick Street, Liverpool.

**WALES.**—Feb. 4.—Competitive designs are invited for municipal offices proposed to be erected by adapting, adding to and rearranging the town hall buildings at Mountain Ash. A premium of 75% will be paid to the author of the design placed first in order of merit. Mr. H. P. Linton, clerk, Town Hall, Mountain Ash.

## CONTRACTS OPEN.

**ASHFORD.**—Jan. 28.—For erection of buildings at the gas-works. Mr. John Creery, clerk, Ashford.

**BEESTON.**—Jan. 28.—For erection of stables and two houses at Millshaw, Beeston, Yorks. Messrs. Buttery & Birds, architects, Queen Street, Morley.

**BISHOP AUCKLAND.**—Jan. 27.—For erection of a Primitive Methodist church, schools and vestries at Cockton Hill. Mr. T. E. Davidson, architect, 14 Neville Street, Newcastle-on-Tyne.

Fig. 5 is an Illustration of "VERITY'S PATENT"

## CHAIN OPENER AND FASTENER,

Specially adapted to Stand Sheet Windows, or any ordinary windows hinged at or near the bottom, and opening inwards  
Can also be made to fix on either right or left hand side when so ordered.

Kindly write for Price List to the Makers:—

FRED VERITY & SON (late Verity Bros.)  
CALL LANE, LEEDS.

Fig. 5.

**BLACKBURN.**—Jan. 27.—For supply of incandescent electric lamps. Mr. Alfred S. Giles, general manager, Electricity Works, Blackburn.

**BLACKPOOL.**—Jan. 29.—For erection of a station at South Shore, Blackpool, for the Lancashire and Yorkshire and London and North-Western Joint Railways. Mr. R. C. Irwin, Secretary, Hunt's Bank, Manchester.

**BRADFORD.**—Jan. 27.—For erection of a Primitive Methodist church, Daisy Hill, Bradford. Mr. T. E. Davidson, architect, 14 Neville Street, Newcastle-on-Tyne.

**BRADFORD.**—Jan. 30.—For enlargement of the operation-room at the Bradford Royal Infirmary. Messrs. Milnes & France, architects, Bradford.

**BRADFORD.**—Jan. 31.—For erection of a lych gate at Scholemoor cemetery. Mr. F. E. P. Edwards, city architect, Chapel Lane.

**BRISTOL.**—Jan. 30.—For enlargement of the petty sessional courts and offices, Bridewell Street, Bristol. Mr. Henry Williams, architect, Imperial Chambers, Corn Street, Bristol.

**CARLISLE.**—For erection of a cottage, Brook Street. Mr. W. Pogson, architect, Devonshire Street, Carlisle.

**CHELMSFORD.**—Jan. 31.—For making, erection and setting to work and maintaining for six months of a 15-b.h.p. oil-engine at their waterworks pumping-station, Ingatstone, Essex. Mr. James Dewhirst, engineer, Engineer's Office, Avenue Chambers, Chelmsford.

**CORNWALL.**—Jan. 27.—For erecting a villa residence at Downerry. Mr. John H. Vincent, architect, 74 Old Town Street, Plymouth.

**DARLINGTON.**—Feb. 3.—For erection of a pair of semi-detached cottages at the Corporation farm. Mr. H. G. Steavenson, town clerk, Houndgate, Darlington.

**DUNDEE.**—Jan. 27.—For construction of a main sewer, consisting of about 2,170 yards of 18-inch salt-glazed fireclay or stoneware pipes and about 1,664 yards of 15-inch pipes, with manholes, &c., for the drainage of back-lying portion along the north side of the city, for the Town Council. Mr. Wm. Mackison, engineer, Municipal Offices, Commercial Street, Dundee.

**EASTBOURNE.**—Feb. 10.—For erection of a technical institute, public library, science and art schools, fire-station, &c., in Grove Road, Eastbourne. Mr. H. West Fovargue, town clerk, Town Hall, Eastbourne.

**FULHAM.**—Jan. 27.—For supply of transformers, mains, conduits, lamp-posts and street boxes. Mr. R. M. Prescott, town clerk, Town Hall, Walham Green, S.W.

**GOOLE.**—Jan. 27.—For supply of one or two steel boilers, complete with fittings, &c., at the new waterworks pumping station near Pollington. Mr. J. C. Melliss, engineer, 264 Gresham House, Old Broad Street, E.C.

**GREAT YARMOUTH.**—Jan. 28.—For erection of a bazaar Marine Parade. Mr. Arthur S. Hewitt, architect, Bank Chambers, Great Yarmouth.

**GUILDFORD.**—Jan. 28.—For alterations and repairs to the double tenement and farm buildings and the erection of an outbuilding at Woodlands farm, Slyfield Green, the sewage outfall for the parish of Stoke. Mr. Edward L. Lunn, architect, 36 High Street, Guildford.

**HASTINGS.**—Jan. 27.—For erection of galleries in the electric-light station, Earl Street, Hastings. Mr. P. H. Palmer, borough engineer, Town Hall, Hastings.

**HAVERHILL.**—Jan. 29.—For erection of a house, offices and stores in High Street, Haverhill, Suffolk. Mr. A. Ainsworth Hunt, architect, Sudbury.

**HEXHAM.**—Jan. 27.—For erection of a main road bridge in masonry and brick over the river South Tyne at Warden, Hexham, Northumberland. Mr. J. A. Bean, county surveyor, Moot Hall, Newcastle.

**HULL.**—For erection of a warehouse, offices, stores, workshops, &c., and an ice manufactory, ice store, freezing-room, engine and boiler-rooms, Middlesbrough. Messrs. Freeman, Son & Gaskell, architects, Albert Chambers, 11 Carr Lane, Hull.

**HULL.**—Jan. 29.—For erection of the first portion of new synagogue and schools, Linnæus Street, Hull. Mr. B. S. Jacobs, architect, Bowlalley Lane, Hull.

**HULL.**—Jan. 29.—For erection of waggon repairing shops, messrooms, &c., Hessel Road, Hull, for the North-Eastern Railway Company. Mr. William Bell, architect, York.

**ILFORD.**—Jan. 27.—For supply of copper rail bonds, fixed stoneware cable conduits, laid and jointed; draw-boxes, &c. Mr. John W. Benton, clerk, Council Offices, Ilford.

**IRELAND.**—Jan. 27.—For supplying and fitting-up with machinery, &c., new central laundry at the Belfast workhouse. Messrs Young & Mackenzie, civil engineers, Belfast.

reconstruction of market sanitary arrangements and conveniences. Mr. Thomas Bury, town clerk, Guildhall.

YORK.—Jan. 30.—For construction of a road bridge over the railway and concrete retaining wall, near Severus Junction, York, for the North-Eastern Railway Company. Mr. C. N. Wilkinson, secretary, York.

### NATIONAL REGISTRATION OF PLUMBERS.

THE annual meeting of the members of the Leeds District Council of the National Registration of Plumbers was held at the Leeds Institute, Mr. J. Wreghitt Connon presiding.

In the twelfth annual report presented by the secretary (Mr. J. W. Burrell), the Council congratulated the members on the success which had attended the movement during the year. In that period there had been added to the local register 43 master plumbers and 103 operative plumbers. The appeal to the Government to take up the new Bill for the Registration of Plumbers and introduce it as a Government Bill had met with a good measure of success, and the Worshipful Company of Plumbers were sanguine of attaining this end in the near future.

The Chairman, in moving the adoption of the report, referred with satisfaction to its encouraging character, and remarked that it showed that the plumbers of Leeds were standing staunch to the registration movement. Mr. T. Headridge (vice-president) seconded the motion, which was agreed to.

On the motion of Dr. J. S. Cameron (medical officer of health for Leeds), seconded by Dr. Porter, a resolution was carried recognising the valuable and necessary work now being done in the present system of registration, and urging the whole of the members of the plumbers' craft, through their Parliamentary representatives, to press upon the Government the desirability of bringing in without delay a measure necessary to place the craft upon a proper legal basis, and thus to increase the efficacy of the existing system of sanitation in buildings.

THE Drapers' Company have given 30,000*l.* towards the new University of London.

# HAM HILL STONE. DOULTING STONE.

THE HAM HILL AND DOULTING STONE CO.

## BUILDING AND BUILDERS.

At a meeting of the St. Andrews, N.B., executive committee on Monday, it was agreed to invite plans for the restoration of the town church from Mr. M'Gregor Chalmers, Glasgow. It was intimated that a member of the congregation had promised 1,000l. to the restoration fund.

THE foundation-stone of St. Paul's Church, Fairhaven, in the parish of St. Cuthbert, Lytham, will be laid to-morrow by Mr. H. W. Worsley-Taylor, M.P. The site for the church, parsonage and schools was given by Mr. J. Talbot Clifton. The new church will meet the needs of the rapidly increasing district of Fairhaven.

THE foundation-stone of a new public hall for Alford Aberdeenshire, which has become necessary by reason of the inadequacy of the wooden building which has hitherto had to serve the purpose, was laid on Saturday last. The new building, which is to cost 1,200l., will comprise a hall 87 feet by 43 feet, and seated for 500 persons, and a small hall seated for 100 persons.

THE characteristic American plan of preferring entire reconstruction to any kind of repairs is, we hear, about to be illustrated at Chicago, where the Montauk building, one of the most notable sky-scrappers in the city, is to be pulled down. Its site may be utilised for part of a new office building. At its last assessment it was valued at over half a million dollars. The new structure is to be erected by the First National Bank of Chicago, which has paid a million dollars for its new site and will spend four million dollars on the new building.

THE Chesterfield Town Council have determined on the erection, by way of experiment, of twenty houses for the poor, subject to the approval of the Local Government Board. The idea was that they should not erect a class of houses which would be brought into competition with those provided by private enterprise, but rather that they should make provision for the very poor for whom it does not pay an ordinary landlord to erect houses, and who are hence driven to dwell in low-rented slum property. The Corporation are advised that they can build houses with one room downstairs and two upstairs to let at 3s. per week, and an application is to be made to the Local Government Board for permission to borrow the money necessary. There is some doubt whether that permission will be given, but at any rate the Council will have made an honest attempt to deal with a very difficult question.

THE baths and parks committee, at their meeting on Monday, under the presidency of Mr. Marsh, resolved to recommend the Birmingham City Council, at their meeting on February 4, to authorise them to proceed with the work. The propose to acquire from the watch committee the police-station in George Arthur Road, which will be vacated as soon as the new premises in Bloomsbury Street are finished. The front part of the building will need very little alteration to adapt to the requirements of the administrative department, and some modification of the cells will be sufficient to transform them into ten private baths for women and sixteen for men. It is not in contemplation at present to sink a well and provide a swimming bath, but a piece of land at the rear of the station

## The "ONE" Range.

PATENT 1331/01.

Agents for Liverpool:—

THE WELL FIRE CO., Ltd.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

This Independent Range is fitted with hot water circulating boiler, as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The casing and oven door are lined with slag wool and a third oven can be arranged if required.

be acquired which may be utilised for that purpose in the future. The proposed arrangement between the two committees is based upon the city surveyor's valuation, and the estimated cost of the conversion will be brought forward at a later stage; it is not, however, anticipated that the outlay will be excessive, or that the cost of maintenance will be very large.

### TRADE NOTES.

THE Mission Hall, Rugby, has been fitted with the latest improved hot-water heating apparatus by John King, Limited, Engineers, Liverpool.

THE ventilation of Mansefield U. F. church and hall, winning, is being carried out by Messrs. Cousland & Mackay, ventilating engineers, Glasgow and Manchester, by means of Mackay's patent direct-acting ventilators and air-panels, of which they are the sole makers.

### A USEFUL DIARY.

A combined diary, blotting-pad and memorandum-pad which at the beginning of each year the Victoria Stone Company sold to their business friends is an extremely useful, as well as handsome adjunct to the writing-table or desk. The diary consists of some hundred foolscap pages ruled for a week's engagements to the page. The blotting-pad is thick and of large dimensions, and the memo-pad, the leaves of which are perforated for detachment, is conveniently placed at the right-hand side, that and the diary, both covered in ornamental cloth, folding over the blotting-pad, to which they form an effective and effectual protection.

### VARIETIES.

A CELTIC cross about 30 feet high is about to be erected at Mahilly, co. Cork, as a memorial of the late Lord Carbery. It was constructed from a design by Sir Thomas Drew, R.C.A.

AS a result of the competition for the Hearts of Oak Benefit Society new offices, the first premium has been awarded to Messrs. Essex, Nicol & Goodman, 21 Waterloo Street, Birmingham; the second to Messrs. Meaby & Webbe, Jessel

Chambers, Chancery Lane, W.C.; and the third to Messrs. Lanchester, Stewart & Richards, 1 Vernon Place, Bloomsbury Square, W.C.

MUCH interest is being taken in Harrogate in the question of the enlargement of the Royal Pump Room. The Corporation have already decided that a new pump-room and covered promenade should be erected at the entrance to the Valley Gardens.

DURING the restoration of All Hallows Church, near Rochester, two fine arches, one fourteenth-century and the other earlier, have been discovered. A consecration cross in a good state of preservation was also uncovered. The church dates from the Norman Conquest, and its ancient Early Norman font and fifteenth-century oak pews and chancel screen have been carefully preserved.

DR. BODINGTON read a paper on "Schliemann's Troy" at the meeting of the Leeds and Yorkshire Architectural Society on the 17th inst. The president (Mr. Butler Wilson), referring to the impending dissolution of Victoria University, said that in the new Yorkshire University there should be a Chair of Architecture, and called upon the architects of the county to support and endow such a chair. Dr. Bodington, in replying, welcomed the suggestion. He would gladly try to arrange for representatives from the Yorkshire College to meet the Council of the Society. The suggestion came at a very opportune time, since the governors were now considering what provision they were to make for the future.

THE Wednesfield parish church, about two miles from Wolverhampton, was burned to the ground on Saturday evening. The church was a very old one, and wood was used largely in its construction, its dryness accounting for the fierceness of the flames and the inability of the firemen to check their progress. Nothing but the charred walls remain of the edifice, which has withstood all the elements since 1760. From the fire only the communion plate and the ancient registers were saved. A heavy bell crashed down among the villagers, many of whom narrowly escaped injury. The vicar, who has been thirty years at the church, which was insured, is lying seriously ill.

THE following circular, dated Wednesday, has been sent to the shareholders of the Welsbach Incandescent Gaslight Company, Ltd., by the secretary:—"I am instructed to inform you that terms have been arranged whereby the members of

ANDREW WILSON writes as follows:—"The 'Tubor' Filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (i.e. germless) water, and thus prevent Typhoid and many other diseases."

the old board have resigned their position as directors and the following members of the advisory committee—namely, Messrs. Philip Stanhope, Thomas James Barratt, George A. Touch, William Whiteley and Edgar Williamson—have been appointed as a provisional board, entrusted with the selection of a definitive board, whose appointment is to be subject to ratification by the shareholders at the next annual general meeting of the company."

THE first seasonal meeting for 1902 of the Historic Society of Lancashire and Cheshire took place on the 16th inst., Mr. J. G. Prentice presiding. The paper of the evening was "Church Dedication in Cheshire and South Lancashire," by Mr. J. Brownbill, M.A., who commenced with a brief history of his subject from early times to the Middle Ages, before people were influenced by political events. A list of the civil divisions of that part of the country was also given, with the patron saints of the ancient churches and an account of the many changes and much confusion that had taken place in the early centuries, many of the original dedications having been lost, and comparisons drawn with other parts of the country showed that the counties' former inhabitants were old-fashioned and showed a distinct preference for the earlier saints. At the close a long and interesting discussion took place, after which a hearty vote of thanks was accorded to Mr. Brownbill for his learned and interesting paper.

AN interesting and very varied programme will be found at the Alhambra just now, the greatest novelty which Mr. Slater has provided for his patrons being the Moug Toon trio of Burmese ball manipulators, whose dexterity is remarkable. The ball first used is made apparently of plaited cane, about 6 inches in diameter, and it is thrown about and caught by feet, knees, thighs and shoulders, but the hands are never called into requisition. The cane ball is succeeded by one and later by three or four of fine blown glass, and the skill with which these are tossed into the air and caught by the "leading gentleman" of the trio approaches the marvellous. This is altogether an attractive turn, on having secured which Mr. Dundas Slater may be congratulated. The programme comprises, however, thirteen other excellent items, including the three ballets "Soldiers of the King," "Santa Claus" and the particularly bright and sparkling "Gretna Green."

IN view of the agitation which prevails in connection with the municipal insurance question for the Cripple Gate area, some interest attaches to the fact that the British Fire Prevention Committee have arranged for a very important test to

take place on Wednesday next with a large warehouse constructed entirely of Karri and Jarrah wood, the floor being constructed on the same principle as recently adopted for big warehouses in the new Free Port at Hamburg. There will also be tests with Karri and Jarrah wood doors for comparison with the fire resistance of oak and teak doors. A large attendance is anticipated, including several foreign respondents, who will be specially visiting London. *A propos* by the way, of the latter, the executive announced that the silver medal which they offered for the best essay on fire-resisting materials exhibited at the International Fire Exhibition of 1901 at Berlin, has been awarded to Lieutenant Elmer of Berlin, the assessors being Chief Officer Giersberg of Berlin, and Mr. Edwin O. Sachs, the chairman of the committee. The essay will be published in the official Government report of the exhibition in the German language, and also in the committee's publications in an English translation.

### THE MAY-OATWAY FIRE ALARM.

AT the Ilford Town Hall on Friday last a large and influential company assembled, on the invitation of Sir Eyre Massey Shaw and the directors of the May-Oatway Fire Appliances Limited, to witness a public test of the fire preventive apparatus which has been installed in the handsome new municipal building.

Among those present were Captain Walker, representing the War Office; Mr. Williams, Admiralty; Mr. A. M. Muir, chief surveyor, Corporation of the City of London; the members of the Essex County Council, Ilford, Wanstead, Leyton, Barking, Walthamstow and East Ham District Councils; representatives of the Poplar, St. George's-in-the-East and other Boards of Guardians; the Royal, North British Mercantile, Hand-in-Hand, and other insurance companies; Great Eastern, Midland and other railways; the secretary of the district chairman of the National Fire Brigades Union; deputation from the London Private Fire Brigades Association; Mr. R. Gordon Stuart, chief officer Johannesburg Fire Brigade; General Electric Co., Western Electric Co., Siemens Bros. & Co., Ltd., &c., as well as a large number of architects, surveyors, City men and directors of companies.

Sir E. M. Shaw, chairman of the company, in his address explained that during his thirty years' connection with the fire brigade he had seen and tested innumerable devices for the prevention or detection of fire and the minimising

loss attendant on their outbreak, but he was quite satisfied to the superiority of the May-Oatway system, as a proof of which he had not hesitated to identify himself with it. Mr. G. H. Oatway (managing director) followed with a few remarks introducing the tests, and an independent committee was formed consisting of Captain Miller, Leyton, representing the National Fire Brigades Union, chairman; J. W. Heyfield, superintendent Woodford Fire Brigade; R. Gordon Hart, chief officer Johannesburg Fire Brigade; Superintendent Smith, West Ham Fire Brigade; C. Bevan, for the London Private Fire Brigades Association; T. F. Britton, chief officer London General Omnibus Fire Brigade; W. Chatterton, chief officer in charge of Midland Railway Company's brigades; Stubbings, chief officer in charge Great Eastern Railway Company's fire brigades; James Sheppard, surveyor to the North British and Mercantile Insurance Company; J. F. Webb, late engineer Metropolitan Fire Brigade; S. Bacon, member of the Board of Guardians; C. J. Dawson, F.R.I.B.A., architect for the School Board; H. K. Gilbey, chairman, School Board; J. Lawrence, East Ham District Council; B. Bailey, chairman, Ilford District Council, for the purpose of devising the most searching tests to which they could subject the apparatus which, as we may remind our readers, only resembles a fire-alarm appliance to the extent that the expansion of metal by heat is used to open or close an electric circuit, thereby causing a signal to be transmitted. A wire having a high expansibility, such as copper or iron, is stretched horizontally across a room or other premises. When tightly strained, the wire "sags" from its own weight, but if the wire becomes heated the sag increases, and the vertical wire and hanging weight attached to the horizontal wire then drop sufficiently to close an electric circuit, whereupon the alarm is sounded. After the alarm has been acted upon the apparatus resumes its normal condition. The first test consisted in lighting fires on the stage in the hall, a spacious apartment 75 feet by 50 feet, and 40 feet high. In a very few seconds the wires which run across the ceiling above were acted on, and a bell was rung in a room situated at some distance, and in a little over a minute a taker, followed immediately by a fireman with a hose, appeared on the scene. In the next test the wire to be acted upon was stretched across the ceiling of the main hall, and in 2 minutes 36 seconds the small fires on the ceiling of the hall had caused it to act, and the bell was again heard. So prompt, indeed, was the action that

even the chairman and managing director were agreeably surprised. Other tests followed, all being equally satisfactorily met, and at the close of the proceedings the committee expressed the liveliest satisfaction at the excellent results attained and the unanimous opinion that the company had provided an appliance which would effectually protect large and small buildings.

### NEW CATALOGUES.

MESSRS. MATHER & PLATT, Manchester, have just got out a new price-list of their "steel-clad motors," which they manufacture in eleven sizes, covering all powers up to 85 b.h.p., and the choice of the speeds and voltages given is very large. All parts are made strictly interchangeable, and machines of any size can be delivered from stock at short notice. A complementary list of "electrically-driven machinery" is also ready.

MESSRS. LUMBY, SON & WOOD, LTD., of West Grove Works, Halifax, have sent us their neatly got-up and voluminous twentieth-century catalogue of boilers for all purposes, which have received the highest award wherever exhibited, including the gold medal at the last Paris Exhibition.

This firm are manufacturers of wrought-iron and steel welded and rivetted boilers for heating apparatus, on the low-pressure hot-water and low-pressure steam systems, including Cornish boilers, vertical steam boilers, besides kitchen-range boilers, copper boilers, steam heaters, valves and fittings, as well as fire and burglar-proof safes, &c.

Special attention may be directed to this firm's high-class steel Cornish boilers, which are made throughout of best mild steel plates, flanged by special machinery, the longitudinal seams in shell being lap jointed and double rivetted, while the ends are made in one plate and well strengthened with stays. The flue ends, moreover, are flanged by special machinery and have Galloway tubes welded or rivetted in.

Another specialty of Messrs. Lumby, Son & Wood, Ltd., is their patent "Pioneer" perfect boiler, of which we understand that 200 to 300 are in actual use in all parts of the country, and some of the most important public buildings, schools, churches and hospitals are heated thereby.

It is worthy of note that the patent "Pioneer" tubes effect a great economy in fuel, while the boilers require the minimum of attention, and for low-pressure steam heating they afford the best results. Among other improvements which have been added, these boilers (both hot-water and steam) have now

double jackets of increased thickness so as to prevent the outer casing becoming too hot.

It may be added that security is afforded by all boilers being tested to a heavy steam or hydraulic pressure before leaving the works, and a certificate of the test is supplied when desired.

### JAMES WATT.

UNDER the auspices of the Greenock Philosophical Society the James Watt anniversary lecture was delivered by Mr. H. S. Hele-Shaw, LL.D., F.R.S., Professor of Engineering in University College, Liverpool, and the subject was "James Watt, Inventor." Professor Hele-Shaw, according to the *Glasgow Herald*, said that the lapse of a century since the great work of Watt, and indeed of a century and a half since that work began, had seen the dawn of what must be regarded as another era in the industrial development of the world. This era is distinguished by the universal awakening to the fact that for industrial pursuits, as for the learned professions, highest possible intellectual training is necessary. It was by a study of the life of Watt, and by the discovery of his views, especially those of his more maturer years, that a true conception could be arrived at as to the proper form which technical education should take. The lecturer, therefore, devoted his remarks entirely to that particular side in the story of Watt which had attracted less attention hitherto, in order to see what lessons could be learned from his history. What struck Professor Hele-Shaw in Watt's correspondence was the remarkable way in which he worked at every detail himself, making experiments and apparatus, and although he had here and there the assistance of others, it was upon himself that he relied, working with his own hands at his inventions, and thinking out each idea himself in every detail. The conception of the idea of a separate condenser, which occurred to him in 1765, and upon which idea he set to work to experiment the very next day, occupied him a great many years of laborious and often painful application before he had the satisfaction of seeing any substantial result. During that time, although he had for years at a time to earn his living by turning his knowledge in other directions, he never lost sight of his great idea. He spared no labour in acquiring all that books could teach him, mastering foreign languages for this purpose, and he performed innumerable experiments when intricate points could be elucidated by scientific investi-

gation and research. He worked in wood, brass, copper and iron, and made patterns with his own hands. It was thus seen that Watt was furnished with three of the great essentials for the successful prosecution of invention in its widest sense. First, the knowledge acquired by reading of what others have done, an intimate acquaintance with and thorough familiarity with the properties of materials acquired by becoming himself a thorough skilled mechanic. Nor must we omit to mention the power of draughtsman which Watt had assiduously cultivated, and which was necessary to go hand in hand with actual workmanship. Watt was not naturally gifted by nature with much artistic skill, but he had evidently cultivated this faculty so that it became one of the greatest services to him. Then, again, by studying the life of Watt, he had become familiar with scientific principles, and by the aid of his knowledge of mathematics was enabled to apply these principles so that, instead of attempting to do things blindly, he contemplated the improvements he had in mind, and had a guide which enabled him to work steadily towards the end he had in view. The instances, of course, which were familiar were those wonderful experiments he made on the properties of heat, and which led him to independently discover the composition of water; but there are other illustrations not so well known, and the lecturer had prepared and put together some sheets of diagrams containing certain of his inventions which would illustrate his resource and fertility in solving mechanical problems. These are taken entirely from his development of the steam-engine, and while illustrating how thoroughly he thought over every aspect of a problem which presented to him, brought home to us the fact that it would have been impossible for him to have conceived these ideas, all of which were thoroughly sound and practical, and put them into effect, unless he had been mentally equipped as well as he was for that work. The first sheet of diagrams consisted of a method of converting reciprocating into circular motion. There was every indication that he intended to use the now universal method of converting reciprocating into circular motion by the use of the crank. The second sheet of diagrams gave the result of his discovery of the use of the expansion of steam as a means of saving great waste and effecting a great economy in its use, which were set forth in his patent of 1782. The third sheet of diagrams gave the various methods by which he proposed to get a straight line motion at the end of his piston-rod, as set forth in his patent dated 1784.

VOL. III. (completing the work) JUST PUBLISHED.

## ART PLATES FROM "THE ARCHITECT"

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889.)

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for Framing.

**THE ENTHRONEMENT OF CHARLEMAGNE.** From the Wall Painting in the Panthéon, Paris, by M. HENRI LAFITE. Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

**MRS. SIDONS AS THE TRAGIC MUSE.** From the original painting by Sir JOSHUA REYNOLDS. Size, Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

**THE ENTRY OF ALEXANDER THE GREAT INTO BABYLON.** From the painting in the Louvre, by CHAS. VANDERSTRAEPE. Size, Thirty-four and a Half Inches by Twenty-seven Inches. Price, Two Shillings each; free by post, carefully packed inside patent roller.

**THE HISTORY OF CLOVIS.** From the Wall Painting in the Panthéon, Paris, by JOSEPH BLANC.

- No. I. VOW ON THE BATTLEFIELD OF TOLBIAC.
- No. II. THE ATTACK RENEWED BY THE FRANKS.
- No. III. THE FRANKS VICTORIOUS.
- No. IV. THE BAPTISM OF CLOVIS.

Each piece Twenty Inches by Fifteen Inches. Price, Five Shillings the set; free by post, carefully packed inside patent roller.

**JAS. NORTHCOTE, ESQ.** By JAS. NORTHCOTE, R.A. Size, Twenty Inches by Fifteen Inches. Price, One Shilling each; free by post, carefully packed inside patent roller.

**BACCHANTE (LADY HAMILTON).** From the Painting by Sir JOSHUA REYNOLDS. Size, Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the Publishers, P. A. G. WOOD & CO. Ltd., 6-11 Imperial Buildings, Ludgate Circus, London.

the series of sheets was devoted to Watt's steam-engine motor. The study of these inventions showed how common he was able to draw upon the knowledge alluded to, utilise the training indicated, and although they may have been equally valuable, were all eminently sound and rational in their conception. Watt made very few mistakes in application of mechanical principles, and we found him on occasions combating false views of mechanical questions, setting forth so clearly the true conditions of the case that we cannot read his writings without astonishment. One particular towards the end of his life has the greatest interest at present time, when mechanical traction on roads has been very much into prominence, and when motor cars have created so much interest throughout the world. Watt had been accused of opposing the introduction of the steam carriage, but just as George Stephenson in his early years opposed numerous impracticable schemes which were well were merely visionary and calculated to be a waste of public money, so Watt, towards the end of his life, writing on the subject of the steam carriage, set forth the difficulties which have been the real causes of preventing its introduction for more than a century after the invention of the steam-engine itself. When quite near the end of his life Watt led—apparently by an obvious want of knowledge on the part of a teacher in Greenock and also of his pupils—to wonder whether there were any other young men of promising genius in the town, and whether native genius might not be fully stimulated by judicious encouragement. After due consideration he determined to appropriate a sum of money to the purchase of a scientific library at Greenock, and the point struck one most was the character of the original list of books proposed by Watt. This included not merely practical books upon naval architecture, shipwrighting, fuel, watermills, &c., but theoretical treatises on fluids, mechanics, conic sections, experimental philosophy, astronomy, and a number of books which were at the time dealt with higher mathematics, such as Euler's "Flexions," the "Differential and Integral Calculus," Legendre's "Geometry," &c.; indeed, a number of books which most people would think quite above the heads of the young men which Watt had in his mind to benefit; and his foundation of a prize at the Glasgow University, as a recognition of the many favours he had received from the learned body, he wrote:—"To excite a spirit of exertion among the students of natural philosophy

and chemistry appears to me the more useful, as the very existence of Britain as a nation seems to me in great measure to depend upon her exertions in science and arts." He should be sorry to conclude his discourse without referring to a fourth and most necessary qualification possessed in such an eminent degree by Watt, viz. force of character. [He was not sure that the lessons to be learnt from his life, if they could only be universally appreciated, and the benefit conferred by its study would not be of equal importance with the material results of his successful inventions.

The lecture was throughout of an exceptionally interesting character, and was eloquently delivered. At the close Professor Hele-Shaw was given a very cordial vote of thanks.

### MASTER PLUMBERS' DINNER.

THE annual dinner of the members of the Glasgow and West of Scotland Master Plumbers' Association was held at Glasgow on the 17th inst. About ninety gentlemen were present. Mr. J. M. Symington, the president, occupied the chair, and Mr. Thos. Daye, vice president, and Bailie Macfarlane, Port-Glasgow, honorary treasurer, discharged the duties of croupiers. Mr. Robert Crawford, in proposing "The Master Plumbers' Association," remarked that, being a member of the Honourable Company of Plumbers, he could tell those present that that company had spent 20,000*l.* in helping on the registration movement, and had devoted themselves, with an entire departure from all the traditions of London Company life, to try to do the best they could to advance and increase the status and to develop the responsibility and education of the plumbers. That company had also done its utmost to put before the public mind the immense importance of seeing to, paying for, and selecting the best kind of plumber that could be obtained. They had also done much to raise the position of the public health of the country. And he was glad to tell them that of all places in the United Kingdom where the response had been made to the efforts of the Plumbers' Company, Glasgow and the West of Scotland had done the very best. That had been so because the men had been alive in their desire to advance with the times. And he believed it was an acknowledged fact that there were no better plumbers to be found anywhere than in Glasgow and the West of Scotland. He had consulted Mr. Fyfe as to the plumbers of the present day, and that gentleman had told him the work was

entirely satisfactory. He was glad to know that their Association was flourishing, and that it had a benevolent side, which he trusted would go on and prosper. The Chairman, in acknowledging the toast, stated that the plumbers held an almost unique position, for they were being continually told that they held the lives of the people in their hands. What havoc a careless plumber might bring about in a building, and even in a city, when with a little foresight much misery could have been avoided and loss prevented. That showed what delight they should have in their craft, and they should make it their aim to strive earnestly and determinedly to attain to the height of perfection that would bring honour to themselves and credit to their trade. He urged them to study sanitary science, and thus discharge the duties laid upon them as individuals and as citizens, and endeavour to play a noble part on the stage of life. Mr. Robert Russell gave "The Lord Provost, Magistrates and Town Council of Glasgow." Councillor Primrose, in reply, said that while at the present moment they stood in presence of many accomplished facts in civic life and enterprise, there were two or three pressing and profound problems facing them in the immediate future. In front of these was that of the housing of the very poor. As to the existence of the evil there was no doubt, and the problem was how best to solve it. Various methods had been suggested. Some had said, "Let us have a Royal Commission." But he believed the answer of Parliament would be that they had had two Royal Commissions, and had provided legislation under which nothing had been done. The alternative of a local Commission offered far more probability and possibility of success. The conditions of every city varied, and a hard and fast codification could not adequately meet the needs of different localities. What he would warmly support would be the appointment of a local Commission, founded on the broad line of practicable possibility and acceptability to the community. He would have on that Commission a certain number of members of the Town Council, and added to that he would willingly take a practical contribution from Gilmorehill, and then he would strengthen the board with citizens who had devoted much of their lives and time, and in some cases part of their treasure, to the solution of that problem. He would further strengthen it with a representation from the Landlords' Association, and then he would appeal to the common sense and patriotism of men who had done and were doing practical work in the various structural conditions that attached to human habita-

tions. With that body he would wish to lay the foundation of a solution of the problem. They might not arrive at an absolute and final conclusion, but could accumulate a mass of opinions of which they could avail themselves, and end probably go to Parliament and ask for sanction to local effort and a new departure towards the solution of the problem. He believed that Parliament, recognising the many blunders Glasgow had been a progressive city, was prepared to give special legislation to face the experience of this question. His ideas might be crude, but he believed the solution of the matter lay in that direction. He held it to be an absolute obligation on the governing body to have a direct hand in dealing with the lowest stratum of the people, and they must approach it without the hope of a return without the possibility—of commercial return. It was a fact that the present conditions were intolerable, and a menace to the well-being of the whole community. To that extent the Corporation would be justified in an effort to do it, did not possess within it the potentiality of commercial success. If in any measure they solved that deep problem, what a work for the community would have been accomplished.

### AMERICAN WORKSHOP METHODS.

At the ordinary meeting of the Institution of Civil Engineers on the 14th inst. the paper read was "American Workshop Methods in Steel Construction," by Mr. H. B. Molteno, M.Inst.C.E. The author, in noticing the fact that recent contracts for steelwork had been secured by American manufacturers in competition with English firms, stated that a description of American methods would be of interest. The quality of American first-class work was excellent in design, material, workmanship and finish, and equal to English work. The cost of labour, though regarded as the amount earned by individual workmen, was less than in England when the quantity of work turned out was taken into account. English bridge works were cramped for room, and hampered with old-fashioned obsolete machinery, while American works were kept up to modern requirements, and obsolete machinery was replaced as soon as it was superseded by anything more modern. Works in America usually ran night and day, and workmen took fewer holidays than English workmen. The author confined his description to the bridge department.

## THE UNION PLATE GLASS CO., LTD., POCKET NOOK, ST. HELENS.

Telegrams, "Union, St. Helens." Nat. Tel. 48.

ESTABLISHED 1837

Interior Lighted by ordinary Plate Glass.

Makers of Ground, Smoothed, Polished, Silvered, Bevelled, Brilliant Cut, and Bent Plate Glass; Rough Rolled and Rough Cast Plate Glass; also of Rough and Polished Prismatic Glass, &c., &c.

### SPECIALITÉ: "REFRAX"

(Protected under Patent Acts).

Extracts from Testimonials received:  
"The 'Refrax' Glass is a GREAT IMPROVEMENT."

"Gives EVERY SATISFACTION."

"The Glass I am perfectly satisfied with; GREAT SUCCESS."

"Compared with Polished Plate Glass 'Refrax' gives TWICE AS MUCH LIGHT for EQUAL COST."

Sold by all Dealers.

Same Interior lighted by "Refrax" Glass.

## VENTILATION AND WARMING

By Mechanical Means, with Filtered, Washed, Warmed, and Humidified Air.  
THE AIR OF APARTMENTS CHANGED FROM 8 TO 16 TIMES PER HOUR WITHOUT DRAUGHTS. ALL BUILDINGS DONE CAN BE MADEIRA IS BROUGHT TO BRITAIN.

Works of the American Bridge Company near Philadelphia, and after giving a general description of the works, the material from the bridge-shop yard through the processes into the loading-up yard, whence it was sent. The bridge-shop was electrically driven, the cranes being machines having each its independent motor. The material was moved longitudinally through the shop on trolleys transversely by electric cranes, the shop was roofed in and the material rested almost entirely on rollers, and every process moved it further along the shop till the work emerged at the opposite end to that at which it entered. The output in gross tons per man per week averaged:—Draughtsmen, 771; bridge-shop, 115; forge, 185; templaters, 2,366. The steel was open-steel, rather softer than was generally used in England, of excellent quality, and giving very uniform tests. The greatest care was taken to deliver all material into the shop yard perfectly straightened. The drawings were made in a very complete manner and gave much more information than was usually furnished on drawings in England. Great care was taken to minimise smith's work, to duplicate as many parts as possible. Stops, guides, spacing punches and multiple punches were largely used. The angle-shear was used much more than in England, and the largest size were sheared at one cut without re-orientation; punches and dies were all made on automatic machines and were interchangeable. All the larger shearing machines were mounted on turntables. Plates were handled by rollers by roller frames or goose-necks and moved by bar working on a fulcrum. Rimming was done by drills, which resembled a Wellington crane with eight drills on it. Pneumatic drills and rivetters, and chipping machines of the Boyer type were much used, and bad holes, which were very uncommon, were rimmed and not drilled. Long pieces were rimmed or drilled by compressed-air machines up to the work by a compressed-air cylinder behind. Large plate-girders were rivetted by hydraulic gap machines mounted on a ram to raise or lower them, the work suspended from an electric Wellington crane traversed on the rivetter-platform. Ends of members were planed by rotary planers which had heads 4 feet 6 inches to 6 feet in diameter, with cutters fixed near the periphery. Angle-plates were bevelled in pairs in a milling-machine with fast feed, and fitted perfectly. Large joists or channels were planed with clip-hooks furnished with chisel points. Planing was done in the works; "Universal" plates were rolled by nearly all American plate-mills at a charge.

Causes of cheap working in America might be summed up as follows:—1. The workmen, though more highly paid in England, turned out a much larger quantity of work. 2. Arrangement of the works was more carefully thought out, and labour-saving appliances were more used. 3. There was more scientific knowledge in the drawing office. 4. The works were run night and day. 5. Planing was reduced to a minimum by care in the drawing office and by the use of automatic machinery and stops. 6. Obsolete machinery was turned out of the works as soon as it was superseded by anything better. 7. All machinery was kept in a state of perfect efficiency. 8. Railway rates were lower than in England. The responsibility for the low output per man in England rested only partially with the manufacturer, who was hampered in every effort to introduce improvements by the action of the workmen. The author pointed out the following lines:—(a) A careful arrangement of works to avoid unnecessary handling and give facilities for such as was necessary. (b) More complete use of stops, guides and multiple punches. (c) The condemnation and removal of obsolete machinery and the proper maintenance of what was in use. (d) The use of motive power. (e) The more extended use of stops, guides and spacing punches. The saving which might be made by systematic methods in the drawing office, and the use of stops and guides and multiple punches, so as to avoid re-templating, was very great. Small portions of the work could be made interchangeable and turned out without marking each piece. The use of the spacing-punch was unnecessary for wooden templates and for marking.

assume that automatic machine operations are invariably more economical than handwork. It was, however, the paper said, beyond dispute that the producing power of the individual, aided by the labour-saving automatic machine, is practically unlimited, whilst we have long since reached the limit of production of the skilled worker making use only of simple machine and hand tools. A high degree of accuracy is possible by either the old or new method; but accuracy combined with cheapness is only possible under new conditions, whilst interchangeability is commercially impossible except in those establishments fitted with the best machine tools and gauges. In regard to the latter, the author said it is not true that the extensive use of accurate gauges is only economical where either highly accurate work is called for or parts are to be made in large quantities. The paper proceeded to describe various modern gauges, explaining the system of "limit" gauges, which are now so extensively used in America, and which are being largely introduced into this country. The subject of milling, which is doubtless a development of the old rose-cutting of early English practice, was next dealt with, some remarkable examples of advanced practice being described. The attributes necessary in the design of a good planing machine were discussed, and the modern system of grinding parts by emery wheels, in place of ordinary machinery, was described. "Chucking," an American term used to designate that class of work which is held in a face-plate chuck, was dealt with at some length, machines and small tools being described and illustrated. Turning, polishing, gear-cutting, jig-work and small tools also received attention. Among the machine tools specially described were the turret lathe, the vertical mill and different types of portable machines. The paper concluded with references to organisation and the apprenticeship question. The meeting was adjourned until Friday, the 31st inst.

## LONDON AND BRIGHTON ELECTRIC RAILWAY.

PASSENGERS on the London and Brighton line are daily speculating as to the possibilities of the new line. All sorts of impressions prevail, says the *Sussex Daily News*, both as to the exact route and the character of the new railway. That it is to be an electric railway, and that it is to be the introduction of high speed railways into the South of England is fairly well grasped, but it has not yet so thoroughly been realised that the primary object of the proposed railway is the rapid transition of passengers from London to the sea, and *vice versa*. It is naturally disappointing to the "people in between" to have to realise that in a scheme to bring London within half an hour of the coast the towns and villages in the country districts must necessarily be slipped past. The idea of a train travelling from station to station, collecting and distributing passengers and goods as it goes along, must be abandoned. At present the plans of the proposed electric railway show no indication of any intermediate station in Sussex. There are rumours that efforts will be made to take up local passengers at three or four intermediate stages, including Haywards Heath, but whatever designs the engineers of the new railway may have in view, the plans give no clue to stations other than at London and Brighton, the length of forty-seven miles including nearly twenty miles in tunnel and covered way, and upwards of seven on viaducts. It is known that the scheme also involves a new bridge across the Thames.

The object of this article is to give Sussex people an idea of the course to be taken by the proposed railway through their county. It is necessary, perhaps, to state that the London terminus will be in the Pimlico district. The proposed line will cross the Thames by a new bridge and south suburban London on a long range of viaducts. In passing through Surrey, the Merstham Downs will be tunnelled under to the extent of seven and a half miles, providing a tunnel that will occupy a very respectable position in the list of the long tunnels of the world. Leaving the Surrey hills behind, the line will bank across the flat pastoral district bordering the two counties. As auctioneers would say, the proposed new line will be within easy distance of its long established competitor. From London southwards it will run on the east side of the present London to Brighton line. In its course along the level belt of country above described the new line will strike the county of Sussex at Tinsley Bridge, entering the parish of Worth. The engineers propose straightening portions of the tortuous courses of several rivers and streams, and the river Mole will be one of the rivers dealt with in this locality. The railway track will run through Worth Park, between the fine mansion of Mrs. Montefiore and the present railway line. It will cross the Worth and Crawley road at a point near the lodge of Worth Park, which is not a great distance from Three Bridges station. Just south of the branch line from Three Bridges to East Grinstead the plans show a large site to be obtained for the purpose of an electricity generating station. The country south of this point becomes

## MODERN MACHINE METHODS.

A meeting of the Institution of Mechanical Engineers on Friday, the 17th inst., in the theatre of the House at Storey's Gate, the president, Mr. W. H. in the chair. The chief business of the meeting being the reading of a paper by Mr. H. F. L. Orcutt, of London, on "Modern Machine Methods." The author received his training as an engineer in American workshops, and has extensive experience in Germany. The paper dealt with automatic machine tools, but the author did not

of the well-known Sussex forest character. On the west side of the line the forest is called the Tilgate Forest. On the east side, through which the new line is drawn, the name of Blunt's forest is locally given, which gives the clue to its ownership. It is a wild, picturesque district, dear to the sportsman with the gun. It begins, also, to show the ups and downs of Sussex country.

In approaching Balcombe parish the new line, after a long run in the open, will go to earth again and tunnel for the considerable distance of 4,307 yards, or more than two miles and a half. This long bore will go under Old House warren. The forest road, with the descriptive name of High Street, will cross the tunnel at an altitude of 250 feet. The tunnel will also go under Balcombe Down and the Highley Manor estate, and emerge at Wellgrove Wood for a short distance, dipping under the Balcombe and Handcross Road and passing between the village and the present railway line, burrowing under the Balcombe and Cuckfield Road by another tunnel some 1,175 yards long. The present railway curves eastward in shaping its course for Haywards Heath, but the new railway will keep in a more direct southern course, and will pass under the present railway line at Beanham Wood, and continue on the west side, still keeping very close company. It will quickly have to face the depressions of the Ouse Valley district, beautiful to the tourist's point of view, but not economical to railway promoters. The view of the magnificent viaduct bearing the present line across the valley is more known and appreciated by pedestrians and cyclists than by the travellers on the railway itself. The new railway will be carried across the valley by two succeeding viaducts, one 400 yards long, crossing the stream at the height of 64 feet, and the other 790 yards. The Ouse, not a very formidable stream at this point, is to be straightened a bit. The next obstacle is Borde Hill, and on this estate the new railway will run into tunnel again for 556 yards. The new line will now be well on the west of the present railway. Leaving the Borde Hill ridge, it will quickly reach the rising ground of Haywards Heath. The town is avoided. After crossing the Lucastes private road, the line will plunge to earth again close to Winnalls, and go in tunnel under the Paddockhall Road and Muster Green for some 827 yards and emerge close to Oakwood.

In a very short distance another well-known depression will be reached, the Valebridge lake and mill being a familiar scene to the thousands using the present Brighton Railway. This valley will be crossed by a viaduct commencing at

Brooklands, crossing the stream at the height of 100 feet, extending 1,923 yards. The new railway has hitherto well clear of Sussex towns and villages, but after crossing the Valebridge district it will land, metaphorically speaking, at the top of the town of Burgess Hill. It will cross the stream by a viaduct 1,050 yards long, its greatest height being 40 feet. The route will go over the Burgess Hill and the junction of Mill Road and Leyland Road, passing a disused windmill over Park Road, Crescent Road and Road, just escaping St. John's Church. The plans point show peculiar lines of deviation, taking in more than is required for the ordinary passage of the line. It given rise to the conjecture that a station of some importance is anticipated. The plans, however, give no indication of the purpose of acquiring the range of property in close proximity to St. John's Church. The line will proceed across the town district, over Station Road, and run on the east side of the London Road over the well-known New Close property. At Hassocks the line will begin its burrowing again at Stamford Avenue, this tunnel going to the main Ditchling to Hurst Road, and its length being 303 yards.

A short spell in the open, and then the line will enter another very long underground course for 7,991 yards, or practically 4½ miles under the Southdown hills, its course just west of the lime-kilns and the well-known road to Clayton Hill. When it emerges on the south side of the hills it will be inside the Brighton borough boundary. It enters Brighton (according to the plans) about 173 feet below the surface of the ground. It remains in tunnel (going over Dyke Road from the east side to the west a little way) north of the Windmill inn) to a point about 11½ chains of Dyke Road Drive, where it is 55 feet below the ground, then enters the parish of Preston rural in an open cutting through Clark's field at a point about opposite the Booth Museum, a length of about 17 chains. It goes into tunnel again north of the old Shoreham Road, and follows the Dyke Road through that portion which is in the parish of Hove on the east side of Dyke Road. The line re-enters tunnel from the last-named point to Buckingham Road, a length of 970 yards, at a depth varying from 77 feet to 32 feet—the tunnel coming to the east of Dyke Road at Seven Dials. The line is again in open cutting from side of Buckingham Road (at its junction with the London Road) to its terminus in Queen Square, where the ra-

et 6 inches above the road level. The gradients generally easy, the steepest being 1 in 300, while the last-named h of open cutting is level. It is not until this point is ned that any interference with Brighton property takes la. It is proposed to stop up that portion of Church Street er part) which lies between Kew Street and New Dorset t, also the whole length of Mount Zion Place, about et at the south end of New Dorset Street, about 300 feet the middle towards the south end of Centurion Road, n about 250 feet from the middle to the south end of St. olas Road.

In lieu of these streets, which are to be closed, it is pro- d to make a new road from Church Street, just above Kew et, going north along the east side of the open cutting for it 500 feet, thence around the face of the proposed tunnel back again to Church Street on the west side of the cutting point opposite the gateway entrance to St. Nicholas ch. The total length of this road is about 370 yards. area of the land proposed to be taken within the limits of eition for the formation of the new road, open cutting and erinus is about 5½ acres, and contains about 150 dwelling es, besides several workshops, stables, stores, &c., and it is rtant to note that part of the churchyard to the east and n of St. Nicholas Church. The whole of the west side of n Square will be taken, including the large institution n as St. Mary's Home, and Wykeham Terrace. The h of streets to be stopped up is 1,320 feet. One of the disabilities to the people in the neighbourhood is that the upper part of Church Street stopped up they will no er be able to secure direct access from that thoroughfare e Dyke Road and the district beyond without making a detour, to say nothing of the inconveniences which will be ed by the severing of sewers, water and gas mains, &c., at point. It will be gathered from this that the whole me embodies engineering proposals of a phenomenal character.

ASSOCIATION OF ELECTRICAL CONTRACTORS.

The first general meeting of the newly-formed Northern section of the National Association of Electrical Contractors was held at the Grosvenor Hotel, Manchester, on Saturday, and was attended by delegates from various towns. Mr. H. Bland, the president of the Association, presided,

and explained the objects of the Association. It was, he said, a combination formed for the purpose of defending the interests of the electrical industry. Many attacks were now being made upon that industry by the municipalities and by other bodies with conflicting interests. These attacks could not be met by the individual traders, but only by organisation. The question of labour was an important one. The manual workers in the trade were now combining in every town, and it had become necessary for the masters to combine also, so as to meet the men in a united body. As to municipal trading, he pointed out that many corporations are now using their powers of expenditure for the purpose of competing in trade against that section of the ratepayers who were engaged in the electrical industry. Of course the corporations were able to undersell the private contractors in every case, for if a loss resulted it could always be made good out of the rates. Parliament never intended the municipalities to use their powers in this way. Municipal enterprise was rapidly growing, and if the electrical contractors delayed much longer they would combine too late to effect much good. It was proposed to form a conciliation Board in connection with the Association, whose influence would be exerted in preventing trade disputes and strikes. Improvement of the laws and rules relating to the trade was aimed at, and they wanted also to improve the technical knowledge and the capacity of every one engaged in it. It was the duty of the combination of masters to help forward the education of the apprentices, to promote excellence in electrical work, and to encourage honourable conduct in business. They wanted to see the electrical trade entirely in the hands of properly qualified electrical engineers, and they appealed to the manufacturers to help them in this matter. The programme of the Association included the formation of local associations in every town to support the objects of the general body.

Mr. Wallis (Leeds) moved, "That the London Central Association be requested to take action in conjunction with kindred associations for the purpose of defining the limits of legitimate municipal enterprise as regards electrical work and strengthening the hands of those who are unfairly exposed to competition by municipal and other authorities trading under Parliamentary powers." He said that municipal trading seemed a very innocent thing when it began, but it had now spread in many directions in which it interfered unfairly with private traders. If municipal trading extended much further electrical contractors would be forced to take up some other

SPLENDID RECORD.

Two Great Newspapers.

The owner of a foundry saved by the May-Oatway Alarm wrote:—"It is the best," and now the *New Star*, referring to a big gas explosion in its own words:—"A satisfactory feature is the test it gave to the May-Oatway Fire Alarm apparatus. Only a little heat was generated the apparatus signalled the alarm, and the fire brigade arrived." The *Daily Times*, whose premises are also protected by the alarm, in referring to the *Star* explosion, says:—"It is apparent that the May-Oatway Alarm is as reliable in the case of an explosion as it has already proved to be on an outbreak of fire." This confirmation of the high reputation gave great satisfaction to the Insurance authorities, the two great organisations which have unanimously recommended this system. Broad Street, E.C.

line of business to support them, while they ran their electrical contracting as a hobby. They did not want the electrical trade to be degraded by unfair municipal competition. Electrical contractors did not desire to prevent the municipalities from extending their works in legitimate directions, but when a corporation began to supply wire to cottage houses and to adopt the free-wire system it was clearly exceeding its duty.

Mr. Richardson (West Hartlepool) seconded the resolution, and suggested that the Association should take action to test the legality of the action of municipalities in undertaking certain work now being done by them.

Mr. Dugdill (Manchester), in supporting the resolution, said that municipal trading in electricity was only the first step towards a purely Socialistic local government. If a corporation supplied houses with electric fittings, why should they not also do the plumbingwork and the carpentering, or even feed the inhabitants?

The Chairman also supported the resolution, and contended that when electrical work was done by corporations the consumers did not get better value for their money than when the same work was let out in fair competition to private contractors. He urged the necessity of offering united resistance to the grant to the local authorities of powers which allowed them to compete unfairly with traders.

The resolution was carried unanimously.

### THE INSTITUTION OF CIVIL ENGINEERS.

THE fifteenth annual dinner of the association of Birmingham students of the Institution of Civil Engineers was held on the 16th inst. in the Grosvenor Rooms of the Grand Hotel. Mr. R. E. W. Berrington, president of the Association, occupied the chair.

Mr. A. P. Dashwood, in proposing the health of the Institution of Civil Engineers, coupled with the name of its president, Mr. Charles Hawkesley, remarked upon the benefits Birmingham students received from the Institution, and voiced the appreciation all felt at the kindness of Mr. Hawkesley in attending that evening.

Mr. Charles Hawkesley, in responding to the toast, pointed out that the Institution of Civil Engineers was founded in the year 1818. It had a small beginning, but had reckoned amongst those who in former years acted for it as honorary

secretary the father of the present Lord Chief Justice of England, who was at that time a barrister engaged in Parliamentary practice, and a good deal interested in engineering matters. The present Lord Chief Justice is now one of its honorary members. The Institution passed through a great deal within his own recollection; changes had taken place through the ever-increasing number of its membership. He could remember when it occupied No. 25 Great George Street, London. But they grew in number. When the class for students came to be added they increased in membership, and now they numbered 6,000 Associates and associate members, and there were exactly 1,000 students attached to the Institution. They now occupied a fine building which had been erected on the sites of Nos. 24, 25, and 26 Great George Street. No. 24 was memorable from the fact that it once contained the office of Robert Stephenson, the great engineer. George Parker Bidder, who practised there until the late Mr. Bidder's death. Speaking of old times, he thought they all wished to bear in mind the old engineers who did so much before there was any teaching, or any text books or books of reference, yet they did work which any one of them might be proud of in the present day. Not long ago one of their members, Mr. Mansergh, took several of the Council to Llangollen to inspect the great aqueduct which Brindley made somewhere about the beginning of the last century, and to see the grand aqueducts near Llangollen. It made one proud to feel that in those days engineers could do such magnificent work. In those days engineers paid more attention than was paid now sometimes to the beauty of their work; they had greater architectural feeling than the engineers of the present day. It would be a very good idea if the young engineers of the present day devoted part of their studies to architecture, and acquired at least some knowledge of its principles, which they could embody in the work they designed. In this regard he might point to the work of the late past president, Mr. Mansergh, at Rhayader. The works he had designed there were designed with due regard to the beauty of their surroundings as well as to necessary strength. These works would do credit, not only to their designer, but to the city of Birmingham for ages to come. Dealing with the examination which the students had to pass, the speaker pointed out that men who failed to pass were eligible for membership of the Association if in the course of their work they proved themselves worthy. He hoped this would be so, because there was no test so good as the work an engineer was able to perform in actual practice.

# The Architect.

## THE WEEK.

THE meeting on Monday to aid in the promotion of a university for Liverpool should be considered successful, for the Lord Mayor was able to announce that about 80,000*l.* had been promised towards the expenses. The city already possesses a university college, which was founded in 1881. At present there are about 700 students in arts and sciences who go through systematic courses, and in addition about 1,100 students attend the day and evening classes. Nearly half a million sterling is invested in buildings, land and endowments. But the college has not the desired status, and the City Council are asking Parliament for powers to convert the college into a university. The word "university" is, however, somewhat inapplicable, for it is not proposed to teach all branches of learning; what is sought is a place which will have a special curriculum adapted to the requirements of Liverpool and the surrounding district. As one of the speakers said, when they came to establish a university in a place like Liverpool, surrounded by the hustle and bustle of daily active commercial life, it could not fail to become permeated with the spirit with which it was surrounded, and to be active in itself. Another speaker pointed out that they ought to be thankful for having two such gigantic schemes before them as a cathedral and a university. A model was exhibited at the meeting showing the buildings already erected and those in course of erection, all of which will be available for the new university.

WHEN it is remembered how wide is the experience of an architect in several classes of business, the training in practical logic which his everyday occupations afford, and the knowledge of law which he must possess in order to safeguard a client's interest, it is astonishing that a larger number of members of the profession is not to be found in the magistracy. The peculiarity is the more incomprehensible when we consider the kind of men that so often make their way among the great unpaid. We are therefore glad to find that Mr. G. W. WEBB has been appointed by the Lord Chancellor as magistrate for the borough of Reading. His professional career is known to his townsmen. After being articled to the late E. W. GODWIN, he entered partnership with Mr. C. B. TUBBS. At the end of five years the partnership was dissolved, and Mr. WEBB started by himself. Amongst public or semi-public buildings designed by him are Swansea Road Board schools, the Wellington Club, the Metropolitan Bank, Messrs. J. & C. SIMONDS's Bank, the Berks County Cricket Club Pavilion, the Royal Hotel (Henley), and BONA's new hotel. He was for many years secretary of the Reading Horticultural Society, and founded the Chrysanthemum Society. He was one of the founders of the Kendrick Lodge of Freemasons. As a Conservative, he was on Mr. A. G. SANDEMAN's committee during the 1880 election, and is now a prominent member of the central committee. He was returned as a member of the Corporation in 1891. Within two years he was elected chairman of the survey committee, and served in that capacity for seven years. As chairman of that committee he brought forward the scheme for the extension of the town halls, which, in extended form, is now under consideration. He used to play for the Reading C.C. He also served on the Reading Regatta committee for many years, and acted as hon. secretary to the Reading Gymnasium Club. Such a record of services well deserves the honorary appointment which Mr. WEBB has received, and no one in Reading can have any misgiving about the new magistrate's impartiality.

THE discontent which the Ecclesiastical Dilapidations Act has caused among clergymen and their representatives was exhibited in an application for an injunction which a few days since was heard before Mr. Justice WRIGHT. The Rev. Mr. SCOTT, the vicar of Gringley-on-the-Hill,

refused to carry out the repairs required on the benefice buildings, on the ground that he declined to recognise the bishop's jurisdiction. He also refused to allow the diocesan surveyor, Mr. JOHN WIGRAM, to inspect the premises. The defendant said that his oath of canonical obedience was to the Bishop of LINCOLN, and he considered that priests were not chattels to be handed over to the Bishop of SOUTHWELL when the new see was created. He had been forty years in the parish, and the only complaint against him arose out of the dilapidations. The Bishop of LINCOLN had not given him notice that he was released from his oath, and in consequence he refused to take an oath to the Bishop of SOUTHWELL. Mr. Justice WRIGHT said that under section 67 of the Ecclesiastical Dilapidations Act, 1871, the surveyor was entitled to enter by force and inspect the premises, but it was much better for him to come and ask the assistance of the Court. The Vicar's obligation was to submit the premises belonging to the benefice to the inspection of the diocesan surveyor. That did not depend upon any oath of canonical obedience, but upon the provisions of the Dilapidations Act. The defendant owed to the Bishop of SOUTHWELL the same oaths of canonical obedience as he owed to the Bishop of LINCOLN. An injunction was therefore granted, with costs. The case is interesting as a revelation that the old privileges of the clergy are presumed to still exist. Nearly all immunities of the kind were set aside at the Reformation. A clergyman may not be a juryman, bailiff, or constable, and while engaged in Divine service he cannot be arrested in a civil suit; but, with those exceptions, the clergy are under the ordinary law, and especially the Ecclesiastical Dilapidations Act, although it sometimes appears oppressive.

ALTHOUGH the Workmen's Compensation Act has a purpose which is indicated by its title, the liability of an employer at common law is not necessarily removed by the clauses. The workman retains his old rights just as they were prior to the passing of the Act in 1897, and if he should fail under the new Act to obtain compensation he has still another remedy. All lawyers are, of course, aware of this fact in England, and we expect the majority of employers as well, but the principle appears to have been unknown in Ireland. To establish the right it was necessary to bring a case before four judges. The plaintiff in *BECKLEY v. SCOTT & Co.* lost his hand while in the defendants' employment. He sought compensation, but the Recorder of Dublin, who heard the case, decided against him because of the short time he was at work. He then brought his action at common law and was non-suited by the same judge on the ground that he had already taken action and failed under the Workmen's Compensation Act. Mr. Justice WRIGHT held that the purpose of subsection 2*B* was to prevent an employer having to pay under the Compensation Act and by common law, or a double amount of compensation. He therefore decided that the trial of the action should take place. Mr. Justice BARTON concurred in that view. Mr. Justice BOYD, on the other hand, held that once the workman elected one course he was prohibited, when that was determined, from taking any other. Mr. Justice GIBSON expressed the opinion that the taking of proceedings under the Workmen's Compensation Act, when they failed was not any bar to an action at common law. The majority of the judges were therefore in favour of a new trial, and the costs already incurred were allowed to the plaintiff.

THE incidence of Easter will this year cause some slight change in the days for sending in works for the next Academy exhibition. All works under glass, comprising architectural drawings, water-colours, miniatures, black and white drawings, engravings and etchings will be received only on Thursday, March 27. As Good Friday will be March 28 and Easter Monday March 31, no works will be taken in on those days. Oil paintings must arrive on Saturday, March 29, and Tuesday, April 1; sculpture, on Wednesday, April 2. The hours for the reception of works will be between 7 A.M. and 10 P.M., and delivery must be at the Burlington Gardens entrance. The other regulations correspond with those of past years.

## NATIONAL PERSONIFICATIONS IN ART.

THE retention of the figure of BRITANNIA on the reverse of the new penny has given general satisfaction. In our prosaic age it is well to have an official acceptance of a symbol. The figure would perhaps have been more welcome if the lighthouse and the ship were introduced in order to suggest that the guardian spirit of the island was seated near the waves. But we should remember that the two adjuncts were not always seen on English coins, and in the most ancient figure of BRITANNIA, or at least that one which is accepted as such, although more likely to signify triumphant Rome, which is on the coin or medal of ANTONINUS PIUS, there is no suggestion of the sea. We now have grown accustomed to see BRITANNIA on certain coins, but the greater part of those which have been produced in England show a different treatment of the reverse.

Having been familiarised with the figure on coins, it is allowable to use BRITANNIA for other purposes. She may be noticed now and then on buildings. Sir JOHN TENNIEL occasionally preferred to employ a BRITANNIA in antique drapery or in modern dress, with an adaptation of the helmet as a cap or a toque, instead of his burly figure of JOHN BULL. For some reason, however, the latter is accepted as the more expressive embodiment of the national type. When seen surmounting the pediment of a building, BRITANNIA is easily mistaken for MINERVA, the patron of art, science and other things. There is much in common between their appearance. It must also be admitted that when poor BRITANNIA appears in the transformation scene of a pantomime, or elevated on the triumphal waggon of a travelling circus, she does not become impressive, and there is no great loss arising from the indifference of sculptors and painters to make representations of the national spirit in her form. It is not easy to endow her with British characteristics, and on that account the lighthouse and the ship were introduced. It is best to think of her as she was seen in vision by CAMPBELL:—

Her march is o'er the mountain-waves,  
Her home is on the deep.

Although BRITANNIA may be regarded as being to some extent a failure as a type of Great Britain, she can be considered as a definite being if compared with Scotia or Hibernia. No sculptor has yet succeeded in creating a form that would be recognised by Scotsmen all over the world as recalling their stern and wild motherland. The woman weeping over a harp which is occasionally made to stand for Ireland has not the dignity nor the resolution which should belong to a national type.

If we turn to France we shall find that a great many artists since 1870 have been endeavouring to evolve the figure of a woman that will worthily represent their country. The difficulties are, however, insuperable. It is desired to suggest primarily France the Avenger, but the good sense of the artists compels them to believe that a figure which is always about to strike can only serve a temporary purpose. It would be superseded if the country were victorious in a contest, and, moreover, such a figure, although expressive enough, is inadequate to stand for the complete France; it only represents the militant spirit but not the France who is mistress of the arts and of many of the joys of life. Meanwhile as a substitute a lion has been made to serve on many of the public monuments to typify the might of France, and the heads employed for the postage stamps are being continually altered in the hope that eventually one will be found which will become eloquent of the general aspiration.

Germany, on the contrary, finds no difficulty in producing an expressive Germania. This is the more remarkable because the land has been long cut up by kingdoms, principalities and dukedoms. From the great hymn by ARNDT it might even be concluded that the Fatherland was some ideal country where truth shone in all eyes and love was warm in all hearts, but one not circumscribed by any terrestrial boundaries. The fact, however, is that figures of Deutschland are of ancient date. Owing to comparatively recent events they are to be seen all over the Empire, and it is generally endeavoured by the artists to suggest some colossal BRUNHILDE who can use the sword in defence, but gives a preference to law. The Freedom's War of 1814

gave an impetus to the production of such figures, and there is no doubt that, whether seen in statues or on coins, the forms served as pioneers to the unification of Germany which was eventually accomplished in the Palace of Versailles.

In all those personifications there is only an imitation of Classic examples. Owing to its physical form Greece was divided into several more or less independent states. In an age when deities were numerous and required occupation in order to while away the tedium of Olympian life it was only natural that each state should claim to be under the protection of a particular god or goddess. The myth relating to the contest between NEPTUNE and MINERVA for the guardianship of Athens shows that a high value was set on the possession of votaries. ZEUS was allowed to have some participation in honours as a recognition of his supremacy. He had an altar and a festival in Athens and his name was respected in other places. It is also believed that some of the earlier race of gods were worshipped if they were honorary protectors. The representative of a Greek city was often an immortal being, and it was no easy matter to determine its true character. When a statue of MINERVA or ATHENE became the personification of Athens, the qualities of the deity were accepted by the people as characteristic of their city or, in other words, of themselves. For that reason at Athens the sculptor's work was of more interest than that of the architect's. The Parthenon was made to appear as a shrine which was too circumscribed to contain its treasure, and every sailor who from afar saw the helmet and spear of the goddess rising above the temple was inspired with confidence in the preserving power of the protectress of the city. In earlier days the idea formed of a deity must have been rather nebulous, but when PHIDIAS executed his *Athene* and his *Zeus* there was more definiteness, and the personification of Athens was accepted as perfect. It was no longer the infinite with its darkness which troubled the citizens; they were able to realise beings with whom the human form was majestic, and in whom time produced no weakness or disturbance of repose.

The peculiar identification of earth with heaven grew, if possible, more pronounced in Rome. The Temple of Venus and Rome which the Emperor HADRIAN designed is evidence of the extent to which it was carried. The building was magnificent, for it was the glorification of the people and of their ancestor, the mother of the pious *ENEAS*. Examples of sculpture still remain which show Rome as she was imagined to be—an Amazon seated on trophies of victory and holding the sword with which the Gauls were won. Such is the figure which is on the medal of ANTONINUS PIUS and which is accepted as if it were the Roman sculptor's notion of the conquered Britain. But generally the Romans preferred to be personified by a mailed MARS rather than by a woman in ample draperies. There was, however, a *Bona Dea* representing a more ancient cult, who was long a favourite with the people, and therefore with sculptors. She usually is shown as wearing a mural crown.

Whatever the majority of the Roman people might think about personifications in female form, we may be sure the statesmen and officials preferred some other mode of recalling the greatness of the city. The four letters S. P. Q. R., or an abbreviation of Imperator, were a more embodied which could not be misunderstood. Probably the representation of the triumphs of CLAUDIUS was thought a more emphatic representation of the sovereignty of Britain than the figure which is now taken as BRITANNIA. The mason's work in roads, bridges, walls and temples was another and more enduring personification, and it has survived throughout the greater part of Europe. The Romans also had figures to suggest the Nile and Tiber and they sometimes flattered themselves and the people they subdued by devising statues which were supposed to be embodiments of local characteristics. Their example was imitated after the fall of their power.

If considered in their practical aspects, it must be admitted that all these personified representations have fallen out of date. Some people now find it difficult to understand what purpose they served. But it should be remembered that it is very often advantageous in scientific work to have knowledge condensed into a formula. The

old sculptors' works to which we have been referring were political formulæ. They summed up the attributes of a country or a city, and even dull men must have had a notion that although a city might be inconvenient, costly or oppressive, in spirit it was such a being as the sculptors had imagined. The figure of BRITANNIA on our coins can in that way still have its use. It recalls, it may be in a dim way, a country and a history of which Englishmen should be proud, and although utilitarians desire something more conventional, we hope it will long remain on the coinage of the country as a reminder of the necessity of continuous watchfulness for national defence.

#### AMERICAN DICTIONARY OF ARCHITECTURE.\*

WE have heard so much of late about American expedition in many varieties of production, we suppose there ought to be no surprise at the completion of the "Dictionary of Architecture and Building" in little more than a year. The annals of publishing do not, however, record a similar case. If we think of how much must be accomplished before three large volumes dealing with such a multiplicity of subjects can be obtained by readers, the organisation that was necessary will be realised. A vast number of articles had to be prepared and co-ordinated, illustrations and diagrams to be drawn or reproduced, and the most characteristic buildings of the world to be brought, as it were, within the range of the reader's vision. In other words, the past had to be explored. But the present was also to be described in connection with various forms of buildings, and even the terms now in use by workmen needed a record. The editor, Mr. STURGIS, suggests some of the problems which he had to encounter when he speaks about definitions not only of things that are, but of things that are not. For instance, what is an arch and what is not an arch; what is the original and the derivative meaning of Doric; in what cases should piazza be substituted for verandah? The English language is not respected always by the representatives of building. "We of English speech," he continues, "have to borrow words from the languages of men more versed and more traditionally at home than we are in the things of fine art, but we may at least take those foreign words in their true senses, and we may use our own English words aright. Let us not force Renaissance to include the Decadence as well; let us not admit that a wainscot can be of marble." These words may be taken as expressing one of the difficulties of an editor when he endeavours to bring unity into a work consisting of contributions by sixty or more writers, as well as countless shorter articles compiled from as many treatises.

The expedition with which obstacles were surmounted will in a few years be forgotten, and the Dictionary must then depend upon the value of its contents, which will be judged as if they were slowly prepared. Readers in Europe may then overlook the fact that the three volumes are mainly an American work. In the United States architecture has been followed of late with so much ardour, it would be excusable if an effort were made to prove that in the art modern Americans had licked European, Asiatic and African creation. But it is remarkable, and at the same time most creditable to the editor and his contributors, that they have looked on architecture in its universal signification—as an art in which the human race has been occupied for several thousand years. American work of the present day is hardly allowed so much space as would have been allotted to it in a dictionary produced in London, Paris or Berlin. There is, for example, only one American office building represented—the American Surety Company's premises in New York, and the name of the architect is not appended. Similar reticence is observed in many other cases. Those who may not be acquainted with the Dictionary may therefore be confident that the desire to attain undue prominence, which THACKERAY and other English travellers have declared to be an American characteristic, is not exhibited in the pages. The same

catholicity is seen in the treatment of such subjects as marble, wood, &c.

The review of the history of architecture in the United States, by Mr. MONTGOMERY SCHUYLER, frankly acknowledges the debt to Europe, and the correspondence between the contemporary efforts for improvement which were made in England and in America. He says that in the middle of the nineteenth century "the art of architecture had seldom sunk so low in any civilised country as in the United States." A Gothic revival began with the erection of Trinity Church in New York. About 1860 the Victorian or Ruskinian Gothic supplanted the earlier variety. It was applied, not only to churches, but to commercial and domestic buildings, and even to Government offices. "Queen Anne" found little favour. The reaction towards Classic architecture was interrupted by the appearance of H. H. RICHARDSON, who adopted Romanesque as his favourite type. He designed, says Mr. SCHUYLER, "Romanesque town halls, court-houses, exchanges, libraries, schools, warehouses and dwellings, all characterised by simplicity and by a cyclopean massiveness, and all have an interest which had a more rational basis than their mere novelty." His influence was immediately felt, and while some contented themselves with copying, others endeavoured to grasp the principle of RICHARDSON'S style. The Romanesque revival, we are told, was the most promising beginning that had been made in the United States, if not in any country, towards the evolution of a living architecture. But it cannot be said to have produced many developments. Subsequently French Renaissance was the favourite. A new necessity had, however, to be met in which mere style became insignificant. Mammon-worship demanded many-storeyed temples in confined areas where ground was costly. No less than thirty storeys under one roof have been made possible for habitation owing to the invention of the elevator. It was requisite to economise space, and steel framing was therefore devised. It was found impossible to distinguish every storey by architectural features. Two or three storeys below received some emphasis, as if to serve as a base, and two or three above to serve as a capital, the intermediate storeys being like the courses of a square or oblong shaft. "The analogy thus suggested of the Classic column has been as closely followed as the conditions will allow, and may be said to have imposed itself upon most designers of tall buildings as a model upon which it is permissible to execute variations only in detail; it is allowable to speak of it as in some measure a new architectural type." Mr. SCHUYLER does not, however, form a very high opinion of the type. In appearance the tall building is factitious, for the true constructional frame is concealed by a screen. But some efforts have been made, it appears, to suggest the relation between the outer covering and the skeleton within, of which the outcome may be more successful as architectural expression.

It must be said that the articles relating to American practice are among the most interesting. The writers realise that time is money, and they endeavour to convey their information in as few words as possible. Take the following passage on the "trimming" of office buildings as an example of the condensation which prevails:—

The preference seems to be generally for wood floors in the offices, though ground cork or plastic asbestos may soon be in general use; mosaics or marbles in the halls, corridors and toilets; wood trimming to the windows and doors on the office side, and in the best buildings fireproof, or wood covered with sheet metal on the corridor side. Communicating doors between offices may be fireproof or not, depending upon the character of the building and funds available. The windows, as before mentioned, may be double hung, or may be made casement windows, opening out, there being two sashes in the frames. The doors should always have transoms over them for ventilation. Occasionally the entire upper half of the corridor partition is made with sash and frames. This is objectionable on the score of fire risk, and because in many offices the space is required for bookcases, pictures, large maps, &c. Fireplaces are sometimes placed in the office, but are objectionable, occupying valuable room, thereby decreasing the rental value of the office. In localities where the size of the lot occupied by the building has resulted in very deep offices, fireproof vaults have been introduced simply to use up the room, as safes are generally preferred. Generally conveniences of this character which are built in the room are likely to meet with

\* A Dictionary of Architecture and Building: Biographical, Historical and Descriptive. By Russell Sturgis, A.M., Ph.D. Vol. III. London and New York: Macmillan & Co., Ltd.

the approval of but a restricted number of tenants, and may profitably be omitted.

The great depth of the foundations required for the lofty office buildings will, we suppose, prevent the removal of one of them to a different position. But some remarkable and successful experiments in that way are recorded by Mr. WIGHT in his article on "Shoring." With the Americans, the English system of shoring does not appear to be appreciated as more than a waste of time and opportunity. They employ shores either for raising buildings or for moving them. One interesting case was conducted under the direction of Mr. WIGHT—a three-storey apartment building in Chicago. According to him:—

There was no possible direction in which the building could be moved as a whole on account of obstructions, for it was 49 by 72 feet in size; so the building, which was a comparatively new one, was cut into two, vertically, through its greatest axis, and moved in two sections, one following the other, on the same platform. The aggregate distance travelled was nearly 800 feet, and three corners had to be turned by each section. The sections had brick walls only on one side, and it was necessary to load the floors of each with 100 tons of sand to balance them. They were successfully put together on the new foundation, anchored and finished off as a new building which has never shown any effects of the operation. The necessity of preserving the proper level of the platform and providing against its gradual settlement in this case will be readily appreciated, but the whole operation was conducted without failure or accident. This is the first time that a brick building has been cut in two and united again.

It is strange that experiments of the same kind are not more often made in Europe, but it appears that Mr. FRIESTEDT, who conducted the operations in Chicago, has lately moved a large building in two sections in Budapesth and reunited them. The authorities would not allow the work to be done until heavy security was given.

An instructive article by Mr. H. R. MARSHALL relates to the preliminary studies for new works. He is opposed to the custom of depending altogether on elevations, and he is not entirely satisfied with perspectives which are made by special artists. Mr. MARSHALL finds models to be less expensive and more useful, for they enable him to study his lights and shadows and coloured masses with great accuracy. He employs a preparation of clay which retains the form given to it, and does not need to be kept wet. The model receives coatings of shellac and then can be painted in oil-colours as desired. The models "can be placed in the sun from time to time during the process of the work upon them, and properly oriented, so that one can study in them the real shadows to be cast by roofs and projections, and not merely the 45 degrees shadow of convention; and, furthermore, they may be photographed from many points of view, the photographic prints being used in place of and much better than elaborately "rendered" drawings, to explain to clients the appearance of the buildings they propose to erect.

The article on glass in windows, by Mr. JOHN LA FARGE, reveals to us that Sir E. BURNE-JONES was not satisfied with the execution of his designs by the firm of MORRIS & Co. He said his designs assumed a commercial shape when thus translated into glass. In such cases the error arises from giving less attention to the execution than to the drawing and cartoon.

We have only glanced at a very few of the articles relating to modern work. In a Dictionary of Architecture the history of the art must, however, obtain most attention. In the third volume there are several elaborate articles which deserve attentive consideration. Mr. PHENÉ SPIERS treats of Parthian architecture, Roman architecture, Persian architecture (Part II) and Syrian architecture. Mr. BLACKALL describes the architecture of Spain and Portugal, Mr. W. P. P. LONGFELLOW Romanesque architecture, Mr. HAMLIN the architecture of Scotland, Mr. FROTHINGHAM, jun., Sicilian architecture, Mr. F. M. DAY temple architecture, &c. We are not exaggerating when we say that all the subjects on which information is generally desired will be found treated at more or less length in the pages. The volumes will refresh the memory of the professional architect who consults them. Owing to the careful treatment and the vast number of illustrations, the contents would

also be found entertaining by gentlemen who possess average amount of education, and they would find a new interest in cities and towns after they had glanced through the pages. There is no similar encyclopædia in the English language which could be so generally useful, and all who have taken part in its preparation deserve congratulation for bringing the work to a successful termination in a time so short as not to allow any part to become obsolete.

## RESISTANCE TO FIRE OF FLOORS AND DOORS.\*

I AM going to limit myself strictly to two departments of construction, namely, floor construction and door construction; but these two departments will give you an idea not only of what has been done, but of what an enormous scope there is in this field of investigation and the collection of reliable data.

Starting with experimental tests with floors, the first which I shall direct your notice is an ordinary floor with joists and floor, the soffit of which was protected by plaster termed asbestic plaster. This was applied on ordinary wooden lathing, and the thickness of the plaster after completion was about  $1\frac{1}{2}$  inch. On drying this reduced itself to about  $\frac{3}{4}$  inch, and during the process of drying cracks developed over the surface. Before the test these were stopped, and the appearance of the soffit as you now see it is due to this cause.

The testee decided to have a 45 minutes' test, 15 minutes a temperature not exceeding 500 degs, then a gradual increasing temperature for the remaining 30 minutes up to 1,500 degs. The summary of effect is as follows:—No perceptible difference in the ceiling was observed during the progress of the test. The application of water caused no injury to the ceiling. No portion of the ceiling fell, either during or after the test. When examined after the test cracks had developed over the surface, and some of the wood laths were charred, but none had ignited. This test may be considered satisfactory, as the object was attained, viz. to render the floor fire-resisting for 45 minutes, which would, under ordinary circumstances, have allowed the occupants in the rooms over to have escaped.

The next floor was of ordinary joists and boarding, but the protecting material to the soffit was slag wool  $1\frac{1}{2}$  inch thick. This was secured with screws to the soffit of the joists, and  $\frac{3}{4}$ -inch matchboarded ceiling was placed under the slag wool. The testee decided to have a test of one hour's duration, with a gradually increasing temperature to 1,800 degs.

The summary of effect was as follows:—At the conclusion of the test the flooring on top was, so far as could be seen, uninjured, and when the joists were examined they were sound. The boarded ceiling had, of course, disappeared, but the slag wool remained in position, and had protected the floor. A good deal of heat was retained in the floor, and at one point where water had not been applied, a small hole was burnt through the flooring some three hours after the test was concluded. This test may also be considered satisfactory, as it retarded the spread of the fire for at least an hour.

We now come to a floor of simple balks of timber laid side by side, any spaces between being filled with fireclay grout, the soffit not being protected in any way; the depth of the balks was 9 inches. This was the Committee's own test, and it was decided to have an 80 minutes' test with a gradually increasing temperature up to 2,000 degs. Fahr. The result was that the under-surface of the wood beams was charred to an average depth of about 2 inches, but beyond this no damage was done. The test clearly demonstrates what fire resistance there is in such a floor, but it must be carefully borne in mind that the space must be left between the timbers that is unfilled by the grouting, otherwise the fire draws up through and spreads to the next floor.

Another floor comprises 7 by 2 joists,  $\frac{3}{4}$ -inch flooring, concrete and Portland cement concrete, 5 to 1, filled in between the joists to a depth of 5 inches, and kept in position by  $\frac{1}{2}$ -inch fillets nailed to the sides of joists 2 inches from the bottom; a ceiling was nailed on to the soffit formed of  $\frac{3}{4}$ -inch matchboarding. The time decided for the test was 75 minutes, commencing with a temperature of 500 degs., and increasing not more than 2,300 degs. The floor also was to be loaded with 100 lbs. per square foot distributed. The result of the test was that the floor collapsed in 82 minutes.

The summary of effect is as follows:—In 15 minutes all the boarding to the soffit was consumed; in 54 minutes flame came through the floor between the last joist and the wall.

\* From a paper by Mr. Edwin O. Sachs, chairman of the British Fire Prevention Committee, read before the School of Military Engineering, Chatham.

I should like to point out here what an important part the 1 by  $\frac{3}{4}$  fillets played in the construction of the floor in preventing the fire getting through, and it was in consequence of the fillets being omitted on the outer side of the two end joists that the flame came through there, and these two joists were the most damaged. The concrete between the two east joists fell out in 74 minutes; meanwhile the fire had been gradually eating its way up the other joists some 2 to 2 $\frac{1}{2}$  inches, they, being thus reduced from 7 inches to 5 inches or 4 $\frac{1}{2}$  inches, could no longer sustain the weight of 100 lbs. per square foot, and the floor and load collapsed in 82 minutes. The floor-boards were not burnt but only blackened by the smoke.

A test of a somewhat similar character to the one just mentioned was instituted to discover the fire-resisting qualities of different descriptions of concrete.

The floor was constructed of 3 by 9-inch deal joists spaced 16 $\frac{1}{2}$  inches centre to centre, which gave seven bays. Two of these bays were filled in to the full depth of the joists with coke breeze and cement concrete, 6 to 1. The next two bays were filled in with pit-ballast and cement concrete, 6 to 1, and the remaining three bays were filled in with concrete composed of pit-ballast three parts, coke breeze three parts, and cement one part. The concrete was supported between the joists by 1 $\frac{1}{2}$ -inch by  $\frac{7}{8}$ -inch fillets. The soffit of the ceiling was plastered, render, float and set, and  $\frac{7}{8}$ -inch flooring was nailed on top of the joists to complete the floor. It was decided to test this floor for one hour and a half to a gradually increased temperature up to 2,500 degs. Fahr., and then to apply a stream of water for four minutes. The summary of the test was that after a few minutes the plaster of the ceiling began to fall, whereupon the lower edges of the joists became ignited and gradually burned upwards. At the end of the period the whole soffit of the floor was seen to be fully incandescent, particularly that in the coke breeze and cement bays. On the application of water the soffit of the ballast and cement concrete and the ballast, breeze and cement concrete immediately disintegrated, and about 3 inches in depth of it fell. The coke breeze and cement alone were not affected. The floor remained in position at the conclusion of the test, but appeared seriously weakened and deflected.

It is to be regretted that it did not remain in position sufficiently long to be photographed, but after a test of this description a good deal of latent heat remains in the materials, and the joists being of combustible material continued to smoulder, and the result was the collapse of the floor five hours after the test. On examining the remains the joists were found to be burnt through from 2 to 6 inches deep, and tapering to a further depth at the ends. The boarding was found to be slightly charred on the underside and at the joists, but otherwise was sound. It could not be said the fire had passed through the floor, although smoke came through, and I think the floor may be considered a fire-stop, although the weight of the concrete caused the collapse of the floor, and might constitute a source of danger on that account. The behaviour of the ballast concrete shows it an undesirable material for fire resistance, while coke breeze has many advantages. The experience gained by the last two tests paved the way to the next; both the previous tests had shown that if the soffit of the joists had had further protection, the fire resistance of the floor would have been greater, consequently a test was arranged as shown, with an expanded metal ceiling suspended 1 inches below the bottom of the 7 by 2 wooden joists, which formed a centreing for the concrete as well as a key for the plaster. The construction will need no further description beyond that the concrete below the joists was of dry ashes and Portland cement, and that between the joists was composed of coke breeze three parts, dry ashes two parts and Portland cement one part. The test was arranged for two hours, which is the longest time yet given for a floor formed partly of combustible material. The temperature was not to exceed 1,300 degrees Fahr., and to be followed by a stream of water for two minutes. The floor also was to be loaded with 100 lbs. per foot distributed.

The summary of effect is very short. In twenty-eight minutes plaster began to fall in patches from the ceiling and continued to fall at intervals till the end of the test, when water was applied and further plaster was washed away. No other effect of the fire was noticeable, and at the conclusion of the test the floor was intact and carried its load. This floor did not subsequently collapse, although it smouldered all night. It was found that all the joists had been more or less damaged by the fire smouldering all night; portions of them were quite consumed, leaving the matrix only in the concrete. The least damaged of the nine joists forming the floor was the centre one, which was intact but for a piece about 12 inches long and 1 inches deep, which was consumed about 15 inches distant from the south end.

The next test, which was submitted by a manufacturer, dealt with a floor supported by 9 by 3 wooden joists with a terra-cotta wired lath suspended ceiling, and an air-space between the ceiling and the concrete filling between the joists.

The lathing was spread over the top of the joists and depressed in the centre to the shape of an inverted arch; upon this the concrete was placed to a depth of 7 inches in the centre, which, when levelled, brought it 2 inches thick over the top of the joists. The concrete was of Portland cement and washed sand, in the proportion of one yard of sand to two bags of cement. The suspended ceiling was formed of terra-cotta wired lathing secured to iron rods fixed to the soffit of joists with iron hooks. Ordinary three-coat work was applied to the lathing, but a proportion of plaster-of-Paris was incorporated with the material. The thickness of the plastering was 1 $\frac{1}{2}$  inch. The test was arranged for one hour and a quarter, the temperature was not to exceed 2,000 Fahr., and the floor was to be loaded with 56 lbs. per foot distributed.

The summary of the effect was that a considerable portion of the plaster ceiling fell during the test, some of the lathing being bare before the test closed. The floor cracked at each side to the extent of  $\frac{1}{2}$  inch and dropped  $\frac{1}{4}$  inch. When water was applied, smoke, steam and sparks came through the cracks in the top of the floor. One of the joists carrying the ceiling was entirely destroyed, two partially so, and one, though discoloured, was practically sound. This floor did not collapse, but its supports were practically destroyed; it trusted for its fire resistance to the suspended ceiling on the terra-cotta, wired lathing and air space, but after the ceiling was pierced, the heat had full play around three sides of the deal joists, and so brought about its ruin. A floor of similar construction, but with iron supports, will be mentioned later.

We now come to floors having pretensions to be fireproof, i.e. the constructional parts of the floor are of non-combustible material, and the committee started with a simple iron and concrete floor, the soffits of the iron joists forming the floor being exposed. The floor is constructed of 5 by 4 $\frac{1}{2}$  steel joists placed 2 feet 6 inches apart and filled in with coke breeze and Portland cement concrete 5 to 1. It was loaded with 168 lbs. per foot distributed. It was proposed to test this floor for 2 $\frac{1}{2}$  hours up to a temperature of 2,300 degs. Fahr., but after 1 hour and 25 minutes, and at a temperature of 1,650 degs., the bulk of the concrete in the two outer bays collapsed, owing to the deflection of the steel joists. The floor began to deflect after 20 minutes at a temperature of 1,200 degs., and a maximum deflection of 10 $\frac{1}{2}$  inches was recorded in one of the joists. The coke breeze concrete was but little deteriorated.

The disadvantage of filling in concrete between joists is in setting-up and striking the centreing, and the attendant obstruction to the progress of the works by the supports.

The Committee instituted the following test in which corrugated iron filled in between the iron joists was the centreing employed, and the coke breeze and cement concrete, 5 to 1, filled in on top.

The soffit of the joists and corrugated iron centreing was protected by 2 by 3 deal ceiling joists suspended from the joists, and wire netting,  $\frac{1}{2}$  in. mesh, was used as lathing and a plaster ceiling, three-coat work, applied, inch floor boards were nailed into the breeze concrete on top, the floor and ceiling having a total thickness of about 12 inches. The floor was loaded with 168 lbs. per square foot distributed. The test was to last 1 $\frac{1}{4}$  hours, and the temperature 2,000 deg. Fahr. In half an hour the ceiling began to fall, and in one hour the ceiling and ceiling joists had all fallen. At the conclusion of the test the soffit of the iron joists and corrugated iron centreing were observed to be red-hot, and the joists had deflected about 2 $\frac{3}{4}$  inches, but on cooling returned to within 1 inch of level. The fire did not pass through the floor, but perhaps the test was hardly sufficiently long to enable a comparison with the former floor to be made, but certainly the deflection of the joists was not so great and the floor would have been serviceable without reconstruction, which the former floor would have not.

The next floor is one in which expanded metal forms a centreing as well as lathing. The construction of the floor is by iron joists 4 feet 9 $\frac{1}{2}$  inches apart, on the top of which the expanded metal is stretched and 3 inches of furnace ash and Portland cement concrete laid and finished on top with half an inch of cement and sand. The joists are protected with a suspended ceiling, as shown, of expanded metal and ordinary plastering applied. The space between the floor and ceiling was ventilated by means of holes in the walls of the chamber. The floor was loaded 140 lbs. per foot, distributed. The test was to last one hour and fifteen minutes, and the maximum temperature was to be 2,000 deg. Fahr. The result was that during this period the fire did not pass through the floor. The plaster ceiling remained intact until the application of water, when some of it was washed away. There was a slight deflection of the floor and ceiling.

We now come to the floor to which I before alluded, and it is on the same principle, but steel joists are substituted for the wooden ones.

Terra-cotta wired lathing is used both for the centreing and ceiling. The slide will explain the construction in detail. The

test was to be of  $1\frac{1}{4}$  hour duration and the temperature was not to exceed 2,000 degs., and the load  $1\frac{1}{2}$  cwt. per square foot distributed. The result was the fire did not pass through the floor, but on water being applied some of the plastering was washed from the lathing. So little was the floor damaged that the testee decided to replaster the ceiling, and the test was renewed at a subsequent date, when practically the same results were observed.

The last floor test to which I invite your attention is one of  $2\frac{1}{2}$  hours. The floor was constructed of iron and concrete, in which all the ironwork was embedded. The steel joists are spaced 6 feet apart, over which are placed stirrups to receive the bridging bars, spaced 20 inches apart. A slab of concrete is suspended to the soffit of girder, and a wood centreing is necessary for filling in the concrete, which is composed of clinkers, broken small, sand and Portland cement in the proportion of four parts clinkers, two parts sand and one part Portland cement. The concrete was 4 inches thick, a further depth of coke breeze and Portland cement concrete, 2 inches thick, was filled in on top of this between the floor strips; the soffit of the floor and the sides and soffits of the steel joists were rendered in plaster three coats.

The summary of this test is thus recorded:—The plaster on the underside of the ceiling and around the beams cracked slightly before the application of water. On the application of water some of the plaster fell off the soffit of the ceiling and beams. The concrete forming the floor was not damaged. That enclosing the beams was slightly damaged and cracked. The fire did not pass through the floor. The wood strips bedded in upper surface of the concrete were uninjured.

I now come to a very interesting series of tests with doors of various constructions and various materials.

For the purposes of comparison it became necessary to first of all ascertain the resistance of any ordinary deal door, and then of a solid 2-inch door of the same material. These tests are made more interesting, as the Committee were enabled to take photographic records of the outside of the several doors during the progress of the tests. You will find upon the screen at the side a tabulated result of these tests, as also a photographic diagram, showing the condition of the various doors at intervals, in most cases of five minutes, taken during the tests.

The first of the tests is that of an ordinary 1-inch ledged door and a 2-inch four-panel moulded both sides door, with panels  $\frac{1}{2}$  inch in thickness. They were fitted into the recessed wall, built about 14 inches back across the hut, one side of the door being in the chamber and the other side exposed to the external air. This arrangement was identical for all the tests, so that a separate description of the size and position of each door will be unnecessary.

Following upon this are two 2-inch bead butt both sides doors, with 2-inch solid panels. One was of deal and the other pitch pine. In 17 minutes flame appeared over the top of the deal door, and in 20 minutes over the top of the pitch-pine door. After 55 minutes the doors were mostly consumed.

We now come to the hardwood doors which are to be the fire-stop, one of American oak, and one of Moulmein teak. The fire came over the top of the teak door in seven minutes, but it did not appear over the top of the oak one for 35 minutes; in 55 minutes the doors were practically destroyed. It should be pointed out that it is very desirable that the doors should fit as closely as practicable; the reason for the flame coming over the top of the teak door so soon was in consequence of its not fitting closely to the frame. Another teak door of similar construction, but somewhat thinner and with the panels in two thicknesses, will appear later on, when the first appearance of flame was after 18 minutes.

The next two doors are of Austrian oak and American walnut; the flame did not come over the top of the oak door till 33 minutes after the fire was started, but in the walnut door flame appeared at intervals after 15 minutes.

The last doors tested in this series were of Honduras mahogany and poplar. The fire came over the top of the poplar door in three minutes, and over the top of the mahogany one in 10 minutes. The condition of the doors after 30 minutes was thus:—The poplar door had all the upper part consumed. It had all disappeared in 40 minutes, and a temporary door had to be fixed in its place to continue the test of the mahogany door, which collapsed at 50 minutes.

It will be observed that these two doors did not stand so well as the deal and pitch-pine ones, although, in justice to the poplar door, it had somewhat warped away from the frame at the top and greatly facilitated the flame coming over, and its consequent rapid consumption.

The committee's experience with this series of doors led them to experiment with doors made of material in three thicknesses, and two doors were made—one of deal and the other of pine. The material was in three thicknesses, the two outer faces being vertical and the inner one horizontal. The boards were in about 6-inch widths, and securely nailed together with 3-inch clasp nails and clinched on the outside;

the total thickness was  $2\frac{1}{2}$  inches. Each door was hung with one pair of strap hinges, 2 feet 6 inches long into brick rebates and before the doors were put in position the rebates were screeded, so that the doors should fit as close to the rebates as possible. These doors stood a longer test than the former series, as will be seen by their condition after 55 minutes. Flame was not seen through the pine door till 60 minutes, although in the deal door flame came through in 39 minutes. The destruction of the doors was very rapid after the flame came through, and at 65 minutes the test was concluded. Iron was the ruin of the doors, as on the nails and becoming red-hot they charred the timber around them and allowed the fire to come through.

This led the committee to test three doors of similar construction to the last, i.e. in three thicknesses, but the thicknesses were secured together by  $\frac{3}{8}$ -inch double wedge-shaped pins, driven in from both sides instead of clasp nails. The doors had frames, and the frames were rebated. The doors were respectively of deal, teak and oak. The test with these doors gave the best results of any of the previously tested fire-resisting doors.

The deal door of this construction was tested against a four-panelled teak door, with the result that at the end of 60 minutes the teak door was almost consumed, but the deal door was practically intact as a fire-stop. The oak and teak door of the same construction as the deal door at 75 minutes were still in position, the teak one being the better of the two.

This ends the series of tests with fire-resisting doors, and we come now to a comparative test with an iron door meeting the requirements of the Building Act under section 77, and a door constructed of wood and encased with tinned steel sheet, lock-jointed and screw-nailed. The test was to be 1 hour, and the summary of effects is as follows:—

The wood door covered with tinned steel plates remained in position, but was much buckled and bulged, and the upper part gradually inclined inwards to a considerable extent, permitting the passage of flame. The first spurt of flame over the top of door was seen after 5 minutes. The iron-framed and panelled door remained in position, but became red-hot, buckled and warped considerably, together with its rebate frame. The upper corner on the lock side gradually inclined inwards to a considerable extent, permitting the passage of flame. The first spurt of flame between door and frame was seen after 20 minutes. Notwithstanding that the iron door buckled, I am of opinion it is the best fireproof door at present in use, but to be effective it requires three hinges and three bolts, and the tendency to buckle is thus hindered.

A test with an iron door with styles and rails on both sides and one with styles and rails on one side only demonstrated the advantage of the door being secured at six points.

## A PAINTER'S DREAM.

IN his last lecture at the Royal Academy Mr. Val Prinsep linked together artists of the age and of the ages, means of a dream he had after studying portraits of painters from the earliest to modern time at the Uffizzi Gallery. He had striven to call up the manner of man each was, and to the character indicated by feature and expression to his knowledge, just as Von Moltke had done when sitting for his portrait before the counterfeit presentments of great military leaders at Versailles. A weird effect was produced on Mr. Prinsep by the presence of so many artists at the Uffizzi, and speculated as to how they would view the art of to-day induced a dream that had intense reality to him. He found himself at the Uffizzi Gallery, and was soon aware of a large company passing before Lord Leighton. In a few terse words the lecturer described the personalities of each guest—Michel Angelo, Millais, Raphael, Landseer, Delacroix, Sir Joshua Reynolds, Turner, Cellini, and the rest, all of whom talked together with ease. Then Mr. Prinsep greatly desired to approach his dear friend, but neither Leighton nor those around took notice, he realised that he was naught in such a goodly company. Leighton's statue, "The Sluggard," was discussed, Cellini finding it a magnificent piece, and the casting excellent, though in his day the artist would have cast it himself. Angelo, too, thought it a remarkable achievement, in many ways perfection, and that this English school, if it respected it, must command respectful esteem if it did not arouse fervent admiration. A few Old Masters examined the paintings, but found them incomprehensible, and when some modern painters tried to explain the meaning, Raphael pronounced them curious, but often mean and trivial, even saying that such things would be forgotten in a few years, asking, was there no religion, no belief? In his day, he further said, they strove to elevate, seeking beauty which would last in spite of modern, flashy fireworks. Hogarth hotly denounced such pretentious dilettanteism, saying he preached stern reality, and would back nature.

outlast convention. Wilkie extolled Dutch genre, and claimed that it was pretty, but Velasquez said the Dutch were content with plausible reality, and the word "pretty" was unknown to him. Then this strangely mingled company, congregated before "The North-West Passage," were eloquent on its delineation of divine form, but thought such fine work was vulgarised by being brought too near to nature, that the head of the old man was truly alive; but the end of art was not realism, and nothing made a soul so pure as to strive after perfection. Here a bellicose voice (Millais) objected to the rocksureness of such dicta, saying of the picture, "It is good, whatever they may say." Giotto and others followed in various strains. Then Titian and Reynolds gave their opinions of the picture, the former finding noble effort to be sincere, but joined to brutality that jeopardised the best art, for there should, he urged, be divine melody without one jarring note, and here was some coarseness, so that the homely melody suffered; yet was it the more wonderful that by treatment he thing was beautiful? Sir Joshua did not find that nobility which he felt in one of West's celebrated works, as his picture lost by commonness, as it was an effective achievement in a rather barbaric way. The ringing voice of Hals remarked that he noticed a want of joy, there was never any frolic, only the dark side of nature; but though he had lived in troublous times, he sought to present the brightest side of it. In defence, Leighton urged that "the sweetest strains are those that tell the saddest thoughts." Velasquez contended there was nothing so common that it could not be raised, and if commonness was shown, the fault lay with the painter, for nature was a book of reference, the words in which must be looked up by poets, or their utterances would be a mass of platitudes. He had himself gone to nature, and found in her none of the mannerisms that Italy had in his time. Millais chuckled at finding himself in the same position as Velasquez, and Rembrandt also backed him up, declaring he was right to paint in his own way; but Millais could not get over Sir Joshua, of whom he thought so much, not liking his work.

### ST. LEONARD'S HOSPITAL, YORK.

A PAPER was lately read before the Yorkshire Philosophical Society by Mr. George Benson on "The Hospital of St. Leonard."

Having traced the history of the foundation of St. Leonard's Hospital, Mr. Benson pointed out that the site was now occupied by the York Theatre Royal. He said that the cloisters were the undercroft of the Hospital of St. Peter, which owed its foundation to King Athelstan, who, returning from the famous battle of Brunanburgh, came to York and returned thanks to God in the Minster for his great victory. He found in the Minster some poor religious people called Culdees, devoted to works of charity. Their work was greatly hindered owing to want of means, so the king granted to God, St. Peter, and the Culdees a piece of ground on which they might erect a hospital, and added for the support of it one acre of corn out of each plough going in the see of York. The piece of ground which Athelstan granted to the Culdees of the Minster is that on which the Theatre Royal stands. On the site buildings were erected, probably of timber, for the hospital. These were destroyed in the great fire of 1069, which leaved the Minster Library. Thomas of Bayeux, when he became Archbishop of York, restored the Minster, and seems to have rebuilt the hospital with stone. A view of the undercroft was fortunately made by Joseph Halfpenny in 1807 and published in his "Fragmenta Vetusta." This undercroft is of Norman work, and consists of two aisles divided by a row of five short columns, opposite to which are flat pilasters to the walls. This apartment was about 80 feet long and 26 feet in width, and covered with vaulting of early character. Plain jointed arches of worked stone spring from the sculptured caps of columns and wall piers enclosing a square area, and this space, within four arches, is covered with rubblework, having plain diagonal groins intersecting each other and rising to the centre. A small wall shaft base has been found, which is identical with that figured by John Browne in his great work on York Minster. This indicates a close connection between the Minster and the Hospital. King William II. enlarged the site of St. Peter's Hospital, and built a church for the hospital and dedicated it to St. Peter. The undercroft, seemingly, was extended some 39 feet by 26 feet and formed L shaped. The chapel would be on the upper floor. The close of the hospital was further enlarged by King Henry I., and he gave them pasture in Galtres Forest for their cattle, wood to burn, and also timber for building. King Stephen built a church for the hospital on the part of the close adjoining the king's street, and the church was dedicated to St. Leonard. The king at the same time changed the name of the hospital from St. Peter to St. Leonard, and under royal patronage the hospital became independent of

the Minster. The history of it was then traced to its surrender in 1537. The ruins and site passed through various hands until 1675, when these were bought by the Corporation for 800*l*. In 1750 Joseph Baker leased the cloisters of St. Peter's Hospital and erected a small theatre. Fourteen years later it was extended over part of the cloister. In 1807 that part of the cloister sketched by Halfpenny was perfect, and remained so till about 1835, when it was cut through for a new staircase to the boxes of the theatre from the then newly formed street of St. Leonard's. Some fourteen years ago the Corporation in making alterations destroyed the greater part of the crypt, and last month saw all the remains cleared away except one bay, which, it is understood, will be preserved. A shaft with base and cap was recently presented to the Museum by Messrs. Parker and Sharp. These fragments may recall the loss which York has suffered in the removal of the historic Norman cloister of St. Peter with the earliest example of vaulting in York, and it was hoped that this fragment would be spared for many years. A great cry had been made about technical education; here was a technical institution to hand for masons, and in it the student could solve his problems. No deadlier blow was struck at education, especially technical education, in this country than in removing these ancient buildings, which had come down to us as perfect examples of the art of design and masonry, from which the designers and craftsmen of to-day draw their inspiration. In conclusion, he expressed the hope that the spread of education would tend to preserve the remaining early monuments of art, hallowed as they were by many historic associations.

### MUSEUMS IN MANCHESTER.

IN a letter to the *Manchester Guardian* Professor Boyd Dawkins writes:—It is clear from the letters in your columns that the public is beginning to realise the importance of improving the existing art museums in Manchester and Salford and of placing within the reach of the community the means of raising the standard of taste. I venture to add to the general discussion the following conclusions, founded on a study of upwards of thirty years of museums, both of nature and of art, on both sides of the Atlantic.

The various art museums and picture galleries in Manchester and Salford should be co-ordinated so as to cover different sections of the vast field of art, each taking some special line of its own. In this manner the opportunity of the study of the highest efforts not merely of the painter and sculptor but of the worker in metal, stone and wood, and of the handicraftsman generally, may be offered to every inhabitant of this city. Any scheme of future development without the latter section of art would not meet the needs of education in this district. We cannot, obviously, raise the standard of art production by the multiplication of picture galleries and by shutting out of art museums the highest work of the craftsman. There is room for great improvement in this direction without the establishment of a new art museum.

If, however, it is possible for a new art museum to be established, we have examples in South Kensington, Liverpool, and Birmingham, which can be bettered and modified to suit the local conditions. At present if I wish to study the best ironwork, or the best examples of enamel or of pottery, or to ascertain the place of Chippendale, Hepplewhite, Adams, or Sheraton in the world of art, I have to travel to London. If there be in this great centre of spinning and weaving a series of specimens illustrating the progress of the arts that lie at the root of the prosperity of this city, from their beginning in prehistoric times down to to-day, it has escaped my notice. These are merely a few indications of the directions in which an art museum, in its wider sense, would be of great value to the public.

There are already in Manchester materials which would go a long way towards the realisation of the ideal museum, in the hands of public bodies and private persons. In the Manchester Museum, for example, there are valuable collections from Egypt and elsewhere which cannot be exhibited, and await the museum of the future, in which they will fall into their proper place. Of private collections there is no end.

On the broad question of art museums in Manchester and Salford, the first step to be taken is to define clearly what is the best thing to do, and then to see how it can be done in the best way. The difficulties cannot be met by the appointment of a specialist, even with plenary powers. They may be overcome by a competent committee. The value of properly organised museums in teaching the people may be measured by the success of the Manchester Museum, which is now bearing the fruits of many years' labour. This movement, it may be remarked, is part of the general awakening of the country to the needs of the time, shown in other directions by the multiplication of technological institutes and new universities

## NOTES AND COMMENTS.

It cannot be said that the Law Society did not show an excess of zeal when summoning Mr. W. A. HASKINS for "unlawfully, wilfully and falsely pretending to be a solicitor." The offence arose out of a letter. In writing epistles on business purposes there is a general desire that they should sustain the scrutiny of lawyers in the courts, and on that account stereotyped phraseology approaching the manner of expression employed by solicitors is often adopted. The writer, of course, does not intend to pose as a solicitor any more than when he uses such familiar combinations of words as "circumstances over which I have no control," and the like. Mr. HASKINS's alleged crime consisted in writing from his office in King's Bench Walk, Temple, to a builder respecting ancient lights, about which, he said, he was instructed to apply for an injunction to restrain the raising of the walls. The letter continued:—"Will you be good enough to furnish me with particulars of the height and lines of your building, and in the meantime cease raising the brickwork, or you will compel me to take action?" The builder, on the receipt of that letter, called on Mr. HASKINS, thinking he was going to see a solicitor, but he found that Mr. HASKINS was a surveyor. The offence was in employing the words "I am instructed." There is nothing unusual in an owner of property who contemplates an action for interference with light and air to go in the first place to his surveyor, or for the surveyor to enter into communication with the builder on the subject. Why should solicitors alone have a monopoly of the word "instructed?" It was stated for the defence that Mr. HASKINS in writing the letter did not pretend to be a solicitor, and he firmly believed the builder would have known he was a surveyor. The Alderman, however, considered that the letter would give the impression that the writer was a solicitor. But as it was a case in which the full fine of 10*l.* was unnecessary, Mr. HASKINS was fined 2*l.* and 3*l.* costs. From the decision it is evident that a surveyor or architect, having an office in a quarter or building where lawyers congregate, should give some indication on his notepaper of the profession he follows, otherwise he is liable to become responsible for the erroneous conclusions drawn by those to whom he writes.

If the agent of some foreign State were to come across the catalogue of the books and tracts on Pure Mathematics in the Newcastle-upon-Tyne Central Library, he could not fail to draw the conclusion that the northern city must be inhabited by students of science more advanced than those who were found in similar places elsewhere. It is true that educated and wealthy people take advantage of the Libraries Act in order to save a little money which would be serviceable to the owners of ordinary lending libraries, and it is not a gratifying sight to see footmen in livery carry out piles of books to carriages in the High Street of Kensington. But students of mathematics rarely possess footmen or carriages, and it is safe to assume that any money expended for their benefit will not inflict a loss on any ratepayers. In Newcastle there is a lending library of mathematical books of an elementary class. But what the devotee of mathematics will be delighted with are the books in the reference department. We doubt if any of the universities are better equipped. The committee have been able to secure books on the science from the early days of printing until the present year. There is a "Euclid" printed in Venice in 1482, and there are others produced between that year and the end of the nineteenth century, including "The Elements of Geometrie of Euclide (Books 1-15), now first translated into the Englishe tongue by H. BILLINGSLEY. Whereunto are annexed annotations of the best mathematicians, and a preface by M. J. DEE, &c." which appeared in London in 1570. There is an "Archimedes" of 1561. NAPIER'S "Arithmetica Logarithmica, sive logarithmorum chiliades triginta" is dated 1624, and a French version was brought out four years later. Mathematical works in all languages are found together, OMAR KHAYYAM, the poet, and RADHAKRISHNAN being among the Eastern representatives. MONTUCLA'S great History is on the shelves, and the student has almost enough materials for testing the accuracy of the statements. But

for many the collection of tracts will be the most interesting part. The list of those by J. W. L. GLAISHER three closely printed pages. A. CAYLEY'S tracts occupy fourteen volumes. Then there are works by men who have won reputation in other fields, such as PASCAL, D'ALEMBERT, CARNOT, the organiser of victory, COMTE, the Positivist, HERSCHEL, and we might add THOMAS CARLYLE, whose tract on proportion forms an introduction to a translation of LEGENDRE'S "Geometry." That so marvellous a collection is available in so modern and practical a place Newcastle-upon-Tyne is most creditable, and happy are the ratepayers who possess so fascinating a treasure. Should we overlook the librarians, Messrs. ANDERTON, RICHARDSON, who have arranged the books, whose catalogue will be found worth reading by lovers of eternal science, who, unluckily for themselves, may not be able to utilise the central library.

NON-EPISCOPALIAN Scotland is not directly suggested by cathedrals, but it need hardly be said that it contains several which are of ecclesiastical as well as of historical interest. Iona, Glasgow, Brechin, Aberdeen, Dunblane, Dunkeld, Edinburgh still retain much of their original character. The change from Episcopacy to Presbyterianism was, no doubt, of momentous importance, but it is a fallacy to conclude that the reformers exhibited their zeal by destruction of ancient buildings. A great many of the English people who visit Scotland are not aware of the fact, and they neglect many interesting buildings through their ignorance. The small volume entitled "Scottish Cathedrals and Abbeys, their History and Associations," by M. E. LEICESTER ADDIS (London: ELLIOT STOCK), is such a book as is adapted to form part of the outfit of a tourist. It is produced in an attractive style, and the numerous photographs are sufficiently large to allow details to be visible. The author has industriously explored the literature relating to the buildings, and especially the papers read before antiquarian societies and reprints of ancient records. The cathedrals and abbeys have been like main actors in Scottish history, and this small volume will therefore, repay attentive study.

## ILLUSTRATIONS.

ST. MARY'S CHURCH, ECCLESTON, SOUTH AISLE, LOOKING EAST.

FOWEY HALL, CORNWALL. CORNER IN DRAWING-ROOM. DINING-ROOM.

CATHEDRAL SERIES.—RIPON: THE NAVE, LOOKING WEST.

FARMHOUSE, FOUR ELMS, EDENBRIDGE, KENT.

THIS house was built at Four Elms, a village near Edenbridge, on the site of an old farmhouse. The walls are faced with red bricks, with red Broseley tiles; the roof and upright framing of first floor, gables, &c. The ground floor consists of two parlours, kitchen, scullery, dairy, pantry, &c.; there is an oven for baking bread in the scullery. On the first floor are three large bedrooms.

Mr. WALLIS, of Edenbridge, was the builder, and Mr. HENRY JARVIS, architect.

HOUSE, EDENBRIDGE, KENT. STABLING.

THESE cottages were built some time ago, and are now being converted into one house consisting of hall, drawing and dining-rooms, kitchen, scullery, &c.; the stairs in one cottage have been removed and new porches put to the entrance. The walls of ground floor were faced with red bricks and the upper storey has hanging Broseley tiles on wooden quarterings. The roof is covered with similar tiles. A verandah with flat roof, forming balcony to first floor, is to be erected at one end. The coachhouse and stable are being built of red bricks with tiles to roof and sides of first floor.

The builder is Mr. LEIGH, of Edenbridge, and Mr. HENRY JARVIS, architect.

## THE ARCHITECT'S USE OF ENAMELLED TILES.\*

THE architect's use of enamelled tiles may be classed, for convenience sake, into three divisions, according to the purposes for which he uses them—either on hygienic grounds, or for the purpose of saving or reflecting light, or for decoration. These three divisions blend and shade off, of course, into each other, and sometimes all three objects are obtained simultaneously in one scheme of tilework. Thus the staircase hall in Lord Leighton's house presents a wall whose surface can be thoroughly and easily cleaned, whose glaze checks the diffusion of air, dirt and moisture, retains its light and colour even in the darkest corners, and by its pattern and hues constitutes a beautiful scheme of decoration. More often a combination of two requisitions only is secured, as in the case where tiles are used to line underground passages, railways, lavatories, dark rooms and courtyards. In a dairy, to take another example, the decorative as well as the hygienic aspects of the case are sometimes considered. But for to-night I shall pass by the builders' and plumbers' use of the material, and shall consider mainly the employment of enamelled tiles as a mode of decoration. Incidentally for this form of decoration I shall claim the collateral advantages it affords both as regards the economy of light and the wholesomeness of the practice of covering the walls with an impervious glaze; but the decorative treatment is what I shall most concern myself with, considering the use and the limits of its use, and what should be the architect's attitude in regard to this method of architectural enrichment. In referring to the examples of tilework in the past, I shall allow myself some latitude in my definition of an enamelled tile, for I shall want to cite the Assyrians' use of glazed bricks, the Persians' treatment of glazed terra-cotta, and the Della Robbias' of glazed earthenware; but the differences which are so apparent are not essential, as they arise from the nature of the material. A glazed brick is only a thicker tile, and a glazed plaque but a wider one. An enamelled tile, then, is a slice of terra-cotta with its face glazed, with white or colouring matter put on it or in the glaze. As a rule, the terra-cotta foundation has a distinct colour of its own, which shows through and modifies the effect of a transparent stained glass poured over it. To obviate this, when the simple result is undesired, there are two methods generally practised; one to render the glaze partially or entirely opaque by the admixture of oxide of tin, the other is to mask the surface of the terra-cotta with a film of white ware or porcelain (technically known as slip), and on this to flow the glass. The difference, in effect, of these two methods is very striking; comparable in terms of water-colour painting to the difference on the one hand of transparent tints, on the other of body colours. In the first instance, the brilliancy of the hues and the subtlety of the gradations depend upon the whiteness of your paper; that is, your highest light, and every tint you lay on it causes so much diminution of brilliancy. So with the slip-glazed tile, the white porcelain face is your highest light, and the more brilliantly white it is, the more brilliant show the colours of your stained glass upon it; it is the light reflected from the ground behind the glass that brings out the glory and splendour of the dyes. So it is precisely with transparent enamelwork on metal; the more brilliant the ground the richer and more beautiful the enamel.

With painting in body colours the nature and colour of the ground is unimportant—brown paper will do; the brilliancy of the finished effect depends upon the purity of your white pigment. So with opaque enamels, whether upon metal or terra-cotta, the brilliancy must be in the glass itself, the ground contributes nothing to the effect. The glass face to the tile is one of the difficulties in tile manufacture. It has to be melted to the tile, brought to a viscid state like treacle, and by rights both the glass and the terra-cotta should contract equally on cooling. But they do not, and the addition of a white ware slip complicates matters. Consequently cracks, generally minute but sometimes serious, occur in the glaze—known in the trade as "crazing"—and may be classed under two heads, those that occurring in the thickness of the film still do not really split it, and those that really divide the glaze, and in consequence expose the body of the tile to the elements. In many cases the "crazing"—where the cracks do not come through the glaze—adds a quality and charm to the tile. The webs of the fissures on either side slope at an angle and catch the light, reflecting the light, giving a lustre and a sparkle to the tile. But where the "crazing" is thorough it is an evil, for it renders the tile unfit for use if exposed to the weather, and even for internal use the beauty of the tile is gradually dimmed, because the cracks in time get filled up with a fine silage of dust, and the effect is that of a black cobweb sullyng the surface.

The question of using tiles externally is made very difficult

by the doubtful behaviour of the tiles themselves. It is a common sight to mark great patches on walls, where tiles have been and have dropped off—to find them cracked and discoloured. The Underground Railway here is painfully rich in examples of their failure, and I note that the linings in the Twopenny Tube are beginning to discolour. Wet, followed by frost, with an imperfect key for fastening at the back of the tile, accounts for the downfall in most cases, whilst the impure atmosphere of London endeavours to discolour everything that it cannot corrode. In Mr. William de Morgan's opinion, tiles made on the "dry" system—i.e. of clay ground dry, and compressed into shape by hydraulic pressure—are unable to withstand the action of frost when damp. The particles are in such a juxtaposition that the tile is soon saturated with moisture, and when this crystallises there is no room for the expansion of the water, and consequently the ice breaks up the tile. By the "wet" system—when the clay dust is mixed with water, and pugged and variously handled before it is dry enough to go into the oven—the disposition of the particles of clay allows for some expansion of the moisture that has soaked in, which enables the ice to be formed without doing damage to the tile or its cement backing. Fixing is often imperfectly done, and unless the fixing is perfect, that is to say, absolutely solid over the whole area of the back of the tile, its detachment is only a matter of time. Tiles made by the "dry" process keep very true in shape throughout all the steps of their preparation—which is by no means the case with those made by the "wet" process—and this accuracy makes their fixing much easier, and when a wall is being tiled with a view to protection from the weather, or reflecting the maximum of light, a close joint is a desideratum. Too much stress, however, I think, is generally laid upon this fine joint and even surface, and the tilework is apt to look mechanical in consequence. We lose much of the inherent qualities of our materials in our attempt to secure an excellence that really does no justice to them, and which has as its chief merit that it saves labour and ministers to our convenience. Now, as regards the necessities of our lives, these be great and real excellences. To be able to build a wall rapidly and well with bricks that can be equably and truly laid, set in mortar mixed, and mixed most efficiently, in a mortar mill, is a true convenience, and all thought to that end is thought worthily expended. But when we come to the luxuries, that is another matter. If you cannot afford to have them done well, why have them at all? It is their excellence that is the justification of their expenditure. And these not quite first-class luxuries defeat their own ends. They are not luxuries unless they amuse and interest us, and how can the blind fingering of a machine tell us of anything beyond its inhuman perfection? Compare a slab of marble, hand-polished, with one that has been polished by machinery. In the first instance the surface is full of life and movement; the light falls on its tiny depressions and irregularities, awakening wayward reflections, strengthening and palliating its colours, developing its lustres and translucencies, so that it becomes rich in story as well as in hue. In the other there is the dead level of polished surface, unassailably perfect, but, comparatively speaking, uninteresting. The life and vivacity of the marble are gone; it is merely a polished record, with the pleasant part of its individuality rubbed away into a wearisome uniformity. So it is with the machine-made wood panelling with which we decorate our rooms and halls. From lack of any other special qualities, its mechanical excellence becomes an offence, and we hang pictures on it, and back furniture up against it, to mitigate and interrupt its exasperating uniformity. So with mosaicwork. To keep the tesserae equal and to set them all to one level face, is to renounce the great quality of life in one's work, and to throw away much that constitutes the charm of the material. With tilework, the same holds good. A great sheet of exact shaped tiles, with dead true faces, irreproachably fixed on a dead straight wall (such as one sees at the Wallace Gallery, Hertford House), is sad misprision of the qualities of the material. The want of thought in the arrangement, the presence of mechanism both in the design and the facture (I can hardly use the word manufacture, for the hands only guide, they do not make) makes the result a bore, and oppressive from the consciousness that it must have been expensive. That all tiles should be made by the wet process and all be hand-painted is asking, in these days of economical production, more than the circumstances demand; but we might narrow our requirements down to these few particulars and refuse to allow ourselves to be tempted to enlarge them: that all tiles should have a sufficient key for fixing; that they should be coated with a glaze that protects them from injury by dirt, acid, or attrition; that those which are to be used for external purposes should be able to withstand the weather, and that when a printed pattern has to be put on its face, that pattern should be of a very simple character, so that its mechanical repetition may be as little tiresome as possible. In firing a batch of tiles there are generally some variations in the intensity of the colours, &c., and where the pattern is very

\* A paper by Mr. Halsey Ricardo read before the Applied Art Section of the Society of Arts.

simple these discrepancies become fairly marked, and when judiciously assorted help to alleviate the regularity of the printed design. There are various shifts that may be legitimately used to temper the exorbitancy of hand labour, such as stencils, printed outlines and so forth, but the cloven hoof is apt to peep out from amongst them. And the larger the area of repetition the more marked becomes the mechanical regularity of the design; a tile used in a single series down the side of a grate hardly betrays the method of its colouring, but a square yard of them blurs out the story beyond any possibility of suppression or disguise. Where cost is a consideration, and a large quantity of space is to be covered, use plain coloured tiles, and encourage such processes as exhibit the humours and behaviour of the kiln. The glory of a tile is its colour—the pattern is little more than a set of pegs on which to hang these colours, and to cripple one's effect by unnecessary care upon the skeletons of one's figures of beauty is a miserable misapplication of force. So much, then, as specification of the tile from the decorator's point of view, and of the chemistry of its clays, of its glass and the methods of handling and firing, I shall not here concern myself; but with the application of the finished article, and that not so much from the utilitarian point of view as from the decorative.

It will be as well, I think, to glance briefly at what has been done in the past, and at examples of what are acknowledged to be masterpieces in the way of tilework, when the art of tile-making and tile-using was at its height. To do this at all adequately is out of the question this evening, and it is only by severe and reluctant pruning that I can contain myself within reasonable limits. I must begin with Egypt because the Egyptians began first. They discovered a stone that would stand glazing, and they used glazed wall decoration extensively. The Tell-el-Yahoudi plaques are to all intents and purposes wall tiles, and their date is 1400 B.C., and Dr. Flinders Petrie has discovered glazed wall tiles of a still earlier date amongst the ruins of the palace erected by Ku-en-aten in his newly-founded capital. The colours mostly have disappeared, owing to the action of the damp during the centuries wherein they lay buried. When the Egyptians used polychrome decoration on their plaques, the different colours were let into the object, making it a kind of tile mosaic—not painting, as in a picture, on the surface.

The discoveries at Susa mark an advance in the art of wall decoration. During the Achæmenian dynasty the royal palace had its walls adorned with panels of painted plaques, but these were rather bricks than tiles, and the methods employed were derived from the glazed bricks employed in the architecture of the Babylonian and Assyrian empires. The walls were built of light grey and light rose, unglazed, bricks ranged somewhat like the walls of the Ducal Palace at Venice, whilst the ornamented parts, which were the portals and great entrance staircases, were in enamelled terra-cotta bricks, the colours being separated by what appears to be a vitreous wall, something after the manner of the metal walls of cloisonné enamels. Darius gave up the use of terra-cotta and employed a kind of concrete for his bricks because he found the enamel wore better on the latter.

From Susa it is but a short step into Persia. In Mesopotamia the Medes built the town of Ecbatana. Up the sides of a steep hill rose the seven circular walls, one inside the other, enfolding the treasury and the king's palace. The outer wall was of immense diameter, and the terraces enclosed by each ring carried collections of country houses with small farms and gardens attached, rather than the suburb building to which we are accustomed. The city was consecrated to the great powers of the firmament, and the devotion of its founders was registered in the form and colour of its walls. The battlements to the outer wall were white, to the next black, the third scarlet, the fourth blue, the fifth orange. The two last walls had their battlements silvered and gilt. Returning from an expedition or from the chase there stood before the eyes of the beholder the city of his home, voicing in its chord of colour the seven great orbs that guarded his family and hearth—the sun, the moon and the five planets—who rose and set in ceaseless vigilance to call him to action, to give him rest, to bring forth meat for him and the kindly fruits of the earth; and when the fever of life was over to proclaim to him by their silent march overhead through the vault of heaven the immeasurable might of fate and the tranquillity of the grave.

This profusion of colour and metalwork strikes us as extravagant even in conception, not to speak of realisation; but in Herodotus's time he was writing of facts well known to many of his readers who had seen Nineveh and Babylon and the pictured splendour of Egypt; and this is how he describes Ecbatana. Amidst this wealth of artificial colour grew up the art of Persia as we know it, and its influence throughout the past has been very subtle and far-reaching. It has coloured India and the shores of the Mediterranean. It is impossible to look at the Moorish work of North Africa and of Spain and not feel the Persian influence exhibited; nay more, most of the work must have been done by actual Persians carried in the

train of Arab conquerors. The art of Byzantium played its part, and probably deeply influenced it, but our knowledge of Byzantine art is at present too imperfect to let us pronounce definitely in this direction. The stream of merchandise flowed through Persia brought with it samples of the porcelain from far Cathay, and after a certain date Chinese influence on the Persian potter is very perceptible. In China coloured tiles are largely used in exterior work. The "Porcelain" tiles of Nankin (destroyed 1853) was so called because the lower nine storeys was covered with glazed brick, the eaves over balconies were roofed in with green tiles and the window jambs plated with glazed porcelain modelled in relief.

In the Middle Ages, and outside the sphere of Persian influence, there was tile-making—but the tiles so made were for pavements and later on for roof coverings. The floor tiles were unglazed, but the glaze soon wore away. Innumerable examples of these abound in England and on the Continent, may be imagined, to reproduce as well as might be the splendours of marble pavements abroad, about which the pilgrims sang when they returned from Rome and Byzantium or from crusades in Paynim lands. When the revival of letters and classic lore and antique art set in, every craft was touched by its influence, and pottery had its Renaissance as well as sculpture. But the tile-makers drew their new inspirations not much directly from the past as from Spain, and thus in a roundabout way came under the influence of Persia. Arabs invaded the Peninsula of Spain, A.D. 711, and remained there, so far as their influence of the tile trade is concerned, till 1610. The Alhambra was begun in 1272, and the tiles that decorate it are the oldest and most interesting in Spain. The style of the tiles was then widely known, and Spanish tiles spread far and wide; they were imported in considerable quantities to Genoa, to Naples, and to the islands westward of the Peninsula of Italy, and in company with the European craftsmen found a market in India.

During the period of the Renaissance various attempts were made to develop the qualities of glazed ware in the direction of architectural employment, the work of the Della Robbia family being the products perhaps the most generally known. Famous factories were established in Florence, Faenza, Gubbio and many other places under Italian rule; and under the Spanish in the Balearic Isles, and in Naples. So famous were they, that they gave a name to ware that lasts to this day. Faience is Faenza. In Majorca is the pottery that comes from Majorca. In the Spanish Peninsula, the Renaissance found a special stage in its affairs. To the south, in what was once the Sultanate of Cordova, Moorish traditions and Moorish craftsmen lingered on, distinct from the Christian workers who absorbed their territory; and these rival potters had occasionally blended, so that besides the Christian and Moresco styles, there was a third style that went by the name of Mudejar. It was not till the time of the Great Emperor Charles that the influence of the Renaissance began to be felt on Spanish work—the painted tiles date from the sixteenth century. Talavera was then the famous emporium, and goods supplied the country, Portugal and the far East.

In England, glazed plaques, other than paving tiles, are rare. There is an interesting specimen in Lingfield Church, Surrey, an effigy of the time of Henry VIII. in green tiles. The figure is incised on a rather coarse red ground covered with a greenish glaze now much worn away. It is supposed, however, that the tiles are of Flemish origin. Similar instances of sepulchral portraiture are fairly common in France.

By the time we are reaching the sixteenth century tile-making in Europe—except for pavings and skirtings—are ceasing to be architectural adjuncts, and becoming—or trying to become—more and more tile pictures. It was the flood-tide of the painters, and painters who prided themselves on their versatility. Every material was pressed into their service: mosaics, stained glass, tiles, pots, plates and dishes—all to come out as pictures regardless of the qualifications and limitations of the material. In Spain, the Spanish Netherlands and the two Sicilies this picture-painting was taken up heartedly—the humours of the material were allowed to be their say, and there is a general air of not being on your guard in the treatment of these panels. If you recall the subject of a set of Dutch tiles you will see a kind of ease in the handling and a liberal acceptance of the imperfections of the material altogether different from the tense serious treatment of the Maestro Giorgio tazza. The result is that these (to us loose and inaccurate but generally accepted appellation) Italian and Spanish tiles persist to this day as living things, whilst solemn works of art are to be found now only in museums, and we can observe how hopelessly dead the art of them has become, by the imitations of them that are being here and there manufactured. These finished picture-tiles fulfil the real want; and as soon as the great burst of enthusiasm and appreciation of all forms of craft was over, and the workshop excellence abated, they dropped out of circulation.

nobody would have—of such things—any but of the very best, and the very best were not being made. Even the other, more meagre, efforts shared in this discouragement and soon sank to a serviceable level, such as lining dark walls and those surfaces that were likely to get discoloured by smoke and dirt; and on these terms they are made and used to this day. The high standard of draughtsmanship and design had this advantage, that the artist, to gain this excellence, had to devote his whole force and attention to the pictorial side of his craft and so became divorced from his material. The tile is no longer treated on its own merits, and its decoration evolved therefrom, but as a field for the painter's display, and to secure effects which, though proper and natural in mosaics and easel pictures, are foreign to the nature of a tile, and can only be extorted—and then but partially—by the most technical ability.

In the East and that part of Europe under Persian influence—as regards the potter's craft—the aim was different. The qualities of the clays and glass were accepted as the basis for development and improvement, and all advance, both in the substance and the technique, was evolved from the tile itself. Nor was the standard pitched either too rigidly or on too high a plane. The ideal was not beyond the reach of the craftsman, and there was no thought of the presence of some superior imported personage who should invest, with the furniture of art, the product of the potter's labour; and yet on those terms we have examples of consummate work—supreme in technique and in beauty. And this art is still alive, and if it could be left undisturbed would go on quietly fulfilling its purpose. Unfortunately the restless activity of modern life, with its eager but ignorant appreciation of foreign work, is knocking at its door, and we are all busied by our patronage to change “the changeless East.” European—and, I am afraid, English—influence has, in its blind admiration for the art of Japan, ruined it. It set up a huge and feverish demand, and the Japanese at once set themselves in haste to satisfy it. Other nations in the East are not so mercurial and consequently have not been so much affected, but they have not been uninfluenced. Both India and Persia, not to speak of other countries, have set themselves to serve the British markets and to conform to British standards. It may be inevitable—it is certainly disastrous. It is sad to think, with our good intentions, how destructive we are of all those qualities we talk so glibly about, destructive because we are ignorant of what is the essence and purpose of the qualities we prize as beauty and art. At this moment we are not agreed as to what constitutes beauty and what is the function of art, and in our perplexity, whilst attempting to preserve and enlarge the influence of beauty, we do actually eliminate it, whilst we are endeavouring to transfer art from the practical side of life, and to view it as a kind of varnish which only the cultured can acquire and the leisured enjoy.

During the past century we worked ourselves up to a consciousness of the beauty of the works of the Middle Ages in England, our Gothic monuments in especial. We set to work to preserve these beauties, and not knowing wherein they consisted, we replaced them with restorations; consequently nearly all of the chief examples, and an immense number of the smaller, are examples no longer. In place of the original, with its history and its beauties, we have a replica which is a modern and silent forgery.

Another common instance of ignoring what constitutes the equal charm and beauty of a thing is, when some traveller discovers a little spot that has been left untouched by the modern excursionist. Struck with its peace, and the beauty that comes from centuries of quiet contention with, and mastery over nature, and anxious to share his discoveries with others, he thus add to their happiness, he shouts aloud in the highways and market-places the beauty of the village he has found, and the simple content of its inhabitants. The ring of enthusiasm in his voice reaches many ears. Next year the village is invaded. A toad-stool growth of cheap lodging-houses springs up, and attractions (so-called) are constructed. The railway sprouts out a branch line, and a station is dumped down cheek by jowl beside the church. The place is now easily accessible, and hundreds can now enjoy the refreshing solitude and idyllic simplicity of the place. Only the solitude and simplicity are gone. So with our improved methods of transit, our facilities of commerce and our demands, too important to be disregarded and too urgent to be properly executed, we have brought Oriental wares within reach of the humblest, but the beauty and excellence of the stuff is fast disappearing.

Let us review some examples of the architectural application of enamelled ware in times before the advent of the railway, and before the influence of the connoisseur was less universally diffused.

And now, what is the moral of all this? One thing that we hardly have escaped notice is the nature of the country in which the examples that you have seen occur. Both in Persia, in India and in the Spanish sierras we are in the presence of arid

wastes. Outside the towns there are no trees, no pasture. There is the blue sky over us—but till twilight too blinding for the eye to contemplate. No doubt there is a colour in the vault of night that can scarcely be imagined by those that have not seen it; but, speaking generally, there is no colour about these cities but what is of man's nurture or manufacture. The spring brings a flush of blossom and a short-lived wealth of verdure—enough to exemplify what luxuriance of colour means. But for the greater part of the year the landscape is a sober, drab affair, with little moisture in the atmosphere to temper the brilliancy of the sunshine. The great function of these enamelled tiles, then, was to catch the fleeting glories of the fields and gardens and, Orpheus-like, to fix them as “a lasting spring.” Both by their design and their colour they recall the starry meads and their wondrous varieties of hues and the lush luxuriance of their verdure.

In the Persian work this is more directly pictured than in the Spanish; but in both the instinct is to secure by carpets, embroideries, tiles and stained glass an entourage of colour.

In this country colour is perennial with us; it has its tides, its ebbs and flows, but even at its greatest ebb we are encircled with tender russet and purple tints from the woodlands and from the ploughed fields; the pastures keep a greenness, the hedgerows an intricacy of innumerable tints; the hillsides are shaggy with copse wood and fledged with pines; sheets of water reflect in intensified colours the vegetation that surrounds their margins, the trees that stand sentinels beside them, the hills in whose lap they lie and the blue of the sky overhead, and into every nook and fold in the landscape the witchery of the atmosphere flings a veil of mysticism, blending and suffusing the colours. At the call of spring the pulse of nature stirs and quickens; the fields put on a richer green; the cloud snow retreats, melting, giving place to the earth snow of the daisies and blackthorn and the pale amber of the primrose. From thence to midsummer the land is one glory of ever changing colour, the beauty of bud and blossom succeeding each other in limitless profusion and reluctantly yielding to its successor. We look out on a garden of living enamel. After blossom comes harvest, the harvest of the field and then of the orchard close, and the trees begin to don their heraldry of gold and bronze and scarlet, vying with the pageantry of the sunset in the skies. Strange swirls and wreaths of dreamy vapour hang indolently about the downs, the woods lay down thick carpets of crimson and copper beneath the beech trees and pine stems, the holly dons a glossier green and tricks itself out in its bravery of vermeil. In this kaleidoscope of colour about us, the need of artificial colour is less insistent. We have but to open a shutter or draw a curtain, and we disclose a painted window. But it is otherwise in our large and crowded towns; there nature's restless activities are confined in space and checked in growth. Year after year the seasons renew themselves, and with the seasons the impulses in branch and herbage. But the privation of light caused by our high buildings and our narrow streets, the acids and impurities of our atmosphere, cripple and scorch the tender growths, and degrade the freshness of their tints, till at last a film of grime reduces the green of summer to an inky grey, and obscures and sullies the yellow of decay, so that we view the complete ruin of the foliage as a desirable riddance, and are thankful to have the fallen leaves swept up and consumed as promptly as possible.

For half the year our city is the colour of a dirty cobweb, and the only refreshment the eye gets is in the glimpses of the sky overhead, the shop windows and the hoardings. These latter mark the hunger for colour significantly. The posters, so far as advertisement is concerned, might as well be in plain black and white, but they fairly wallow in colour. Often this chromatic carnival fails in effect, but the failure is due to ignorance of how to obtain the proper value, not from any sparingness in the application of the tints. And this liberality of colour is provided not out of generosity or exuberance of advertisement, but to supply a felt want. We want colour in our streets; we have tried for it by using coloured building materials, paint, creepers and flowers in window boxes, and we have gone to the cost of all these endeavours not merely to gratify our own cravings in the matter, but for the pleasure of the passer-by in the street. But these ventures are generally disconnected attempts, and so are on too small a scale to make any distinct effect, and owing to the nature of the materials they soon sink back into the general dinginess of the surroundings. Why not plate your building with tiles? I do not suggest that a man should veneer his vertical section of a street-side that serves him as his house and let his neighbour on either side follow or not his novel start, because colour to be effective in such circumstances must be in broad masses. I should like to see whole streets treated in permanent colour and please myself with the hope that some day they may be so, but as a beginning in so bold an experiment I should like to see the scheme tried on a detached building, standing free and with some trees about it, or a public building of such a frontage as should be sufficient to display a large mass of plain wall sur-

face. We have tried spots and panels of colour here and there in our streets already, and they have failed from the timidity of their employment and the insufficiency of their area. The colour must be laid on in a broad bold mass, and pattern used only sparingly, if at all. The windows and other openings should occur in a field of plain colour, or some simple chequer or trellised diaper, and the limits of the tiling should be bounded by bands and trimmings of glazed terra-cotta. I specify glazed terra-cotta, because in building you must not mix perishable and imperishable materials together. Whilst the one is toning, softening and decaying under the blighting hand of time, the other is merely getting dirty, and each time the front of the house is cleaned the tiles come up as fresh and bright as the day they were fixed, whilst the corroded framework must remain with the grime that age has brought it. This permanence is not so great an evil as at first appears. Much—say, one-third—of a house front consists in any case of imperishable materials, such as the glass windows and the woodwork, which are renewed periodically with coats of paint, and whilst the remainder of the house is toning into a dingy uniformity, the harmony of the frontage is, every few years, disturbed by the freshened appearance, under the painters' hands, of the parts required by the covenants of the lease, and thus making of the harmony a painful discord. It is true that where the materials are all indestructible, the kindly agency of time can play no part, the building is never any better than when it leaves the contractors' hands, except for the history that gradually humanises its walls. But this view of the ameliorating power of time belongs to our timid age, the age not of creation but of selection, and is by no means a healthy one. We are afraid to risk anything, and why? because we are so self-conscious, because we are so eaten up with our sense of responsibility. Not so came the models which we copy into being, although at this moment the style of the past most in vogue is perhaps the most self-conscious that we could have chosen, and (for this follows) the one that is the most disdainful in its refusal of colour. The love of colour and the power to apply it is characteristic of youth—of the youth of nations as well as individuals. Colour is the accompaniment of romance, of poetry, of enthusiasm, of abandon. Before the cold paralysis begotten of experience that we call wisdom colour pales and fades away. The best, and by that I mean the most inspired, work is done in youth, and the colour then is the richest and most eloquent, though some there be, like Gian Bellini or, to come nearer home, Mr. Watts, who retain their colour faculty right on into old age. In youth a nation has the courage to court failure, or, rather, to regard it as a passing circumstance in its attempt to grasp the ideal. For what to them was failure but the stepping-stone to new effort? So much experience brought to them so much new knowledge and suggested so many fresh possibilities. Not only the science of architecture, but the beauty which is the cream and bloom of science grew up from the careful observation of building disasters, and the invention of expedients that might obviate their recurrence. The conditions of the time and the temper of the people determined the actual forms of the building, so that, for example, we get in one case Classic, in another Gothic architecture; but these styles were living only so long as failure was allowed to be possible and experiments encouraged. When that ceased the art of architecture became a recapitulation of past examples, the science their reconstruction or adaptation. Why should we fear to cover whole streets in London with coloured tiles? Is there anything to lose? The streets at present are not beautiful nor are they interesting. The modern ones have no single architectonic quality. There is no general principle of design in them, no uniformity, style, composition, balance; a few good examples of designs occur in the general welter, but they make no effect on the whole, which mainly expresses private obstinacy, tintured with selfishness. What could be gained by a broad treatment of colour is periodically shown to us when the Quadrant at Piccadilly gets repainted. In that fine sweep we have an idea, unanimity of design and breadth of colour, and in consequence it is one of the pleasantest things one can meet in one's tramp through town. It may be objected that to encrust whole streets with enamelled tiles would be a very expensive business, and that the decoration, whether we liked it or not, would—owing to the cost involved in applying it—be permanent. I will take the latter objection first. It would, I hope, be permanent. Any scheme, reasonably comprehensive, simple and straightforward, must be a distinct improvement on the present polychromatic distraction, gradually surrendering its distinction under the obliterating coating of London grime. No other surface wears so well. Stone perishes rapidly. Brick and terra-cotta get incurably befouled. Marble requires frequent repolishing. Granite endures, but unless it be polished it also gets very filthy. But a good glazed tile, glazed brick or faience should be as durable as a plate-glass window, unaffected by the wildest acids that infest our atmosphere.

Then as to cost. Of course, tiles by the acre come expensive. But there is another side to the matter that we may

as well consider. At present our buildings, in order to get contrasts of light and shade—colour, in short—are covered with ornamental features, such as mouldings, pilasters, wall trimmings, cornices, balustrades and the like architecture upholstery, and adorned generally with a profusion of intricate carving. Now, although all this architectural frippery is cheap stuff considering, still, it does cost money, and the use of colour we can dispense with the bulk of it. The projecting cornices and sills, the carving and features give form so many shelves and nooks for the dust, dirt, and products of coal combustion and the unhydrated acids enveloping them. The rain comes and washes the collected dirt and the brickwork, whilst the liquid acids proceed to eat the stone. Besides, these big projecting cornices are the purpose of casting deep shadows, the very last things that we want in our streets. In tilework we can reproduce effect, and count upon its loyal service, whereas in our present work the effects of light get reversed by the soot, our lights become the deepest blacks, and the soffits, that should be in shade, are the brightest parts of our mouldings. So that a colour scheme with tiles the value of projections is gained in patterns and particular dispositions of tint, and all that is wanted besides the tilework are slips of some glazed material to act as boundaries to the fields of colour. There is another virtue in tilework besides its being imperishable and self-cleaning, and that is that it is impervious to the elements. There is not the same necessity to load up our girders with thick masonry walls to keep out the weather. A thin glazed skin is sufficient for this purpose, and our walls will be dryer and warmer as well. The ordinary brick wall is as thirsty as a sponge-cake, and after a heavy rain there is an immense amount of water to be vapourised before the walls can become dry and warm, and the weight of this water is considerable. With a glazed skin beyond the comfort of unchanging temperature, so much firing to dry the water will be saved. Moreover, the rain, instead of doing the house will help to clean it, and after each shower the streets of the filth, disease germs and acids, will be washed into drains and be got rid of comfortably.

But there is more to be done with tiles in the way of external decoration than merely to put them on the fronts of buildings. There are bridges, walls and fountains to be considered. Glazed brick makes an appropriate casing for the concrete arches of our modern bridges, and the spans might be most effectively treated with fine civic heraldic designs executed in tiles. Then as to our public places; take Trafalgar Square for an instance. At present it is an arid waste and ineffective, with various disconsolate grimy black spots attempting to ignore the presence of the two steaming fountains which mark significantly the proximity of St. Martin's and washhouses. Let us imagine it taken in hand and made to serve some pleasant and useful purpose, and, so far as we can, made beautiful. We will begin by reducing the inordinate size of the basins to the fountains and lining them with turquoise blue tiles, and by stipulating that for the future the fountains should spout clear water. We will lay the whole of the area, except a fringe to the south of the necessary paths, which shall be of Purbeck stone, with turf, and jealously keep the hoofs of the loafer from off it. The statues shall be cleaned up, and kept clean by frequent scrubbing or gilded. Gordon's statue should be moved nearer to the north wall, and the number of future statues permissible, and their positions, at once determined, so as to present an intelligible scheme, the wall serving for a background. This wall we will treat for the most part in plain colour, so as to form a quiet backing to the statues beneath the parapet we will have a row of hatchment arms of those who have done good service to the State, and who were connected with that neighbourhood. Beyond this base of colour rises the National Gallery, made richer by this coloured setting. At present we quite waste the statues by the inappropriateness of the sites chosen for them. Standing in the midst of the confusion and turmoil of crowded streets they form pathetic objects helpless in the torrent of the traffic, or else they are stranded against the building and absorbed in the conflicting detail of their surroundings. The monument is made regardless of the site, as nobody in authority seems to care, it is dumped down at the first convenient spot handy, where it may divide with the shadowing lamp-posts the duty of dividing the traffic and imprisoning the pedestrian.

Of the internal application of tiles there is not much to say. A good deal has been done in this direction of interesting description, but by the nature of the case most of the examples were conditioned by special circumstances. An early example of the decorative treatment of tilework can be seen in the refreshment and grill-rooms at the South Kensington Museum, and examples of Mr. Waterhouse's treatment of tiles may be seen in his various public buildings, banks, and insurance offices. Mr. Butterfield, in several of his London churches, was also a pioneer in this species of decoration, though the tiles he used were for the most part those mis-

oustic, rather than the enamelled ones. Subsequently Aitchison built the Arab Hall for Lord Leighton, using the most part the collection of old Oriental tiles that Lord Leighton had procured, and decorating the staircase with mainly new ones, but in admirable sympathy with the old. Outside the specimens of old tiles in the British and South Kensington Museums, a more beautiful sample of Persian tiling is not to be seen in England. Leighton House also helps to dissipate the rather general idea that a tile-surface must look cold and uncomfortable, for tiling can exceed the air of protection and richness that even plain tiles on the staircase give. Since then the practice of using tiles for internal decoration has increased immensely, and more in what are known as business premises than in private residences. It is consequently for the external use of our decoration that I would specially plead, and for the decoration to be of a permanent kind, got either by enamelled, glazed faience or mosaic. The French have already made some excursions into this field, notably at the Paris Exhibition, and are still pursuing the subject of building in tile and terra-cotta. It is a matter, I think, of deep regret that at the Victoria and Albert Museum, South Kensington, we are so plucky a start was made in using materials that with our climate, and carrying them out with so much interest and beauty, there should now be abandonment of the spirited use of tile instead of development, and that there should be a reversion to the tame respectability of stone. One might have expected that in a new building, for new purposes and on so large a scale every opportunity would have been taken to advance a step further the architecture of the present day, and since the occasion seemed so suitable to erect an example of coloured tile architecture. The result of this stony disdain, this proud exclusiveness of our streets, is that we can't live in them. Every day thousands upon thousands escape by every railway line these masterpieces of correct architecture and superfine craftsmanship to the shelter of the country, where the earth is green about them and the heaven blue above them. Cannot we make our streets a little more kindly and comforting to those who are prisoners who cannot escape? We have tried mass and light and shade, might we not now have an attempt at colour?

The paper was illustrated by a series of lantern slides, and cartoons of Sir Edward Poynter's designs for the decoration of the grill-room of the Victoria and Albert Museum, lent by the Board of Education.]

### ARCHITECT'S COMMISSION.

The Court of Appeal on the 24th inst, before the Lord Chief Justice, the Master of the Rolls and Lord Justice Mathew, the case of *Keats v. Rendle* came on for hearing. It was an appeal of plaintiff from the judgment of Mr. Justice Day, on February 11 last at Exeter, with a jury. Lord Coleridge said the case was one in which the jury had returned a verdict for plaintiff for 200*l.*, but judgment was entered for defendant. The action was for architect's commission. Plaintiff, Mr. James Henry Keats, was an architect who had been engaged in the preparation and sale of a number of building estates, and he came into communication in 1885 with defendant, who, with others, desired to develop an estate known as the Vinstone building estate, near Plymouth. Communications were entered into between the parties, as the result of which an arrangement was come to, the interpretation of which was that plaintiff was to receive 5 per cent. commission on all land sold. The interpretation of the agreement was contained in a letter by plaintiff to defendant, which was accepted by the latter as being correct. A good deal was done on the estate, and plaintiff received from time to time commission on plots sold. On October 26, 1896, defendant wrote to plaintiff stating that it was probable the owners of the estate would receive an offer for a considerable portion of the property as a whole, in which case they would not require the further services of an architect, and asking for plaintiff's charges, as the amount was to be settled with the co-owners, who were anxious to clear off all liabilities in respect of the estate. Plaintiff contended that this was contrary to the terms of the arrangement, and the case resolved itself into one of damages for wrongful dismissal. His contention was that plaintiff explained to the owners that he was not anxious for the situation except upon his own terms, which were that when any plots on the estate were sold he was to have 5 per cent. commission. The terms were agreed to, and for some years plaintiff obtained all sorts of purchasers, and no dispute arose as to the payment of his commission until a purchaser came forward who was apparently prepared to buy the whole lot, whereupon the owners wished to terminate their arrangement with the architect. That was the bargain.

The Lord Chief Justice: Your case is, then, that they might dismiss him.

Lord Coleridge: Not until the estate was sold. Continuing, he said the jury found a verdict for plaintiff on a question merely of fact. It was true they did not give him all he claimed, their view being, he supposed, one of damages for wrongful dismissal. There was nothing to show that plaintiff could compel the owners to sell any more land, but there was nothing unreasonable in suggesting that the terms of the bargain were thoroughly understood, and that so long as they continued to sell plaintiff was to receive 5 per cent. commission. The jury took the view that so long as plaintiff was willing to act for them the bargain could not be put aside. He submitted that the jury were right in their verdict, and that the learned judge ought not to have set the verdict aside on a question of fact.

The Master of the Rolls said a person was not bound to keep on employing a house agent.

The Lord Chief Justice asked counsel if he could put the agreement between the parties higher than that plaintiff was to have 5 per cent. on any land, however sold, so long as he was their agent.

Lord Coleridge said he could. Their lordships might think it was an agreement rather harsh upon the defendant. That, however, was not the point.

The Lord Chief Justice: Do I understand you to say that 5 per cent. commission is to be paid on land sold years after a person has ceased to be an agent?

Lord Coleridge said, of course, if he ceased to be an agent of his own account he could not recover. He contended, however, that plaintiff's terms were that he should continue to act as architect for the estate and receive commission on all sales.

The Lord Chief Justice said he did not find anything to show that plaintiff should continue for ever, but that he should have 5 per cent. on the sale of land, whoever sold it. Did not that mean "whoever sells it so long as I am your agent?" Counsel had to show a contract continuing plaintiff as the agent so long as there was any land unsold.

Lord Coleridge said he could only reply that the jury thought that such was the case.

Lord Justice Mathew: Was not the contract for services rendered on each occasion?

Lord Coleridge said he inferred that the class of house throughout the estate was to be selected by the vendors, so as to suit the neighbourhood and its requirements, and rather showed, if anything, that plaintiff was to be the architect of the whole estate.

Lord Justice Mathew: Was he not the agent of the vendors?

Lord Coleridge said they might call him an agent in one sense.

The Lord Chief Justice said he need not trouble counsel on the other side. For upwards of twelve years plaintiff had acted on certain terms, namely, that he was to receive 5 per cent. commission on sales of land for certain estates, whether he made the sales or not. To that extent he thought plaintiff had protected himself. It was now said there was also a contract that so long as the gentlemen concerned owned the estate he would continue as their agent, or that if they did not they would pay the 5 per cent. commission. In order to establish that it must clearly appear on the face of the contract. He thought that the outside it could be said to amount to was that it was a bargain that during the time he was their architect, whoever sold the land during that time, he should get 5 per cent. He did not think there was anything to show that the defendant had not the right to determine the contract. He thought Mr. Justice Day acted right in setting aside the verdict, and he did not think the case ought to have been left to the jury.

The appeal was therefore dismissed, with costs.

### THE ENCLOSURE OF STONEHENGE.

THE Amesbury Parish Council has petitioned the Wilts County Council under Section 26(4) of the Local Government Act 1894 to take action in the matter of the obstruction of alleged public rights of way leading to Stonehenge. The parish council admit that something should be done to secure the preservation of Stonehenge as a unique national memorial, but they do not think it is necessary for the stones to be surrounded by an unsightly barbed-wire fence or other means of enclosure, or that the public should be subjected to the imposition of an admission fee of 1*s.* to obtain access to the monument. They state that it is their conviction that the carriage tracks which lead to Stonehenge from three admitted public roads within which it lies are undoubtedly public ways. In associating themselves with the many protests of societies and of archaeologists, they desire to add that ample evidence is procurable to show that the tracks have always been used by the public.

## YORK ARCHITECTURAL SOCIETY.

A NUMBER of members of the York Architectural Society visited on the 18th inst. the York New Opera House, where they were received by the architect, Mr. John P. Briggs, who conducted them over the theatre and explained its principal features. The stage, which is on the Cumberland Street side of the building, came under review first. From it a capital view of the house was obtained, and those who recalled its condition as the Corn Exchange could not fail to be impressed with the transformation. Workmen were busy everywhere hastening its completion for the opening on the following Monday night. Above the floor of the auditorium are two tiers of seats having their fronts oval in form, and from which the line of double boxes splay to the stage opening. The asbestos curtain was dropped in order to show how the stage could be cut off from the rest of the theatre. The dressing-rooms were inspected. The stairs ascend to the gallery 20 feet above the stage. On the far side gallery the long line of ropes looked formidable; these are arranged in groups of three for drawing up or lowering the scenery. A ladder was climbed and the "gridiron" reached some 40 feet above the stage. The gridiron floor is suspended from the roof, and the floor formed of 5-inch boards with 2-inch spaces. On the floor are fixed the pulley-blocks for the ropes. There is a large louvered lantern over, and also a doorway on to the roof. The party now descended and inspected the auditorium. The front of the dress circle is richly decorated with boldly projecting figures, the upper circle with ornaments. The stage boxes are double, having scagliola columns surmounted by a richly-decorated frieze and pediment. The ceiling has a large circular panel, slightly domed. From the centre an ornamental pierced pendant hangs; above will be a fan for ventilation purposes. The decoration is cream, enriched with gold, and the whole is lighted with electricity. The entrances came under observation, and that from Clifford Street was particularly attractive. The thanks of the Society were conveyed to Mr. J. P. Briggs for his kindness in conducting the members over his well-designed Opera House.

## THE DISCOVERIES IN THE FORUM.

GREAT interest is being taken in the numerous and important discoveries being made in the Foro Romano. Some account of the progress of the work is given by Mr. F. G. Fotheringham in the pages of *Moring's Quarterly*. We make the following extracts:—

Much doubt existed for a long period as to the precise position and limits of the Forum, but these have for some time past been satisfactorily determined, and during the last two years important excavations have been there carried on by means of a very thorough and judicious method which has lately produced very important results. The most important of these is the discovery of the Lapis Niger. On January 10, 1899, while the workmen were engaged in excavating in the centre of the Comitium, they brought to light a pavement of black antique marble of about 11½ feet square and a foot in thickness, known as the Lapis Niger, which rested on made-up earth that had been collected there from other localities. On further excavating under the pavement they found at a depth of 4 feet 9 inches a corresponding basement of sandstone of the same geological formation as that of the Palatine, or of the upper stratum of the Capitoline. On the two extremities of this basement are two low quadrilateral structures, ornamented with an imposing Etruscan cornice, which has in part been broken away. Their dimensions are 8½ feet and 4 feet respectively in length, and 4 feet 1 inch equally in breadth, and between them there is a small open space of 3 feet 4½ inches, so that the entire frontage of the building to which they belong is about 11 feet 2 inches. The plinths of the columns are 11½ inches high, and are joined laterally by a layer of sandstone of about 1 foot 5½ inches, in which steps have been cut. The open space between the two buildings is enclosed by a parapet wall of sandstone 1½ inches high and 1 foot 8½ inches in breadth, which extends for 2 feet 4½ inches.

On the open space between the two buildings there is a slightly rounded pedestal on which is placed a monolithic cone of sandstone of 1 foot 7½ inches in diameter, and near it is another stone in the form of a pyramid, that measures 1 foot 6½ inches by 1 foot 8½ inches at the base, of which the top part has been broken away; what remains of it is 1 foot 7½ inches in height. This latter stone was not found in situ, but was discovered in its broken state between the Forum and the Comitium near the Arch of Severus, having been removed from its original pedestal. These stones are covered with numerous inscriptions, the letters of which have been deeply cut into the stone and are of the old Greek form, being similar to the oldest Etruscan inscriptions found on the Etrurian seaboard.

The numerous and important articles that have been in and around the votive heap of the Lapis Niger arranged in a classified form, and are all to be placed in a new museum of the Roman Forum. Therein are included a great variety of objects, many of which are archaic, the earliest of them, as has already been stated, belonging to the sixth or seventh century before Christ, and the most recent belong to the fifth century of our era. A period of centuries is thus represented.

All the objects were found in the greatest possible order among deposits of cinders and ashes, and not stratified according to the different periods of their origin, thus indicating that they had not been collected gradually one by one, but that they had been transported from other receptacles of a similar character. The place where they were thus heaped has all the appearance of a sacrarium, and the collection there of so large a quantity of sacrificial votive offerings would seem to indicate on the part of those who transported them that they wished to preserve them sacredly. This course may have been necessitated by the growth of the city of Rome and the exigencies of space in its walls, but at what period it took place it is not possible to determine.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

AT a meeting of this Association, in their rooms, 117 George Street, on the 23rd inst.—Mr. H. Kerr, the president, in the chair—Professor Baldwin read a paper on "The Dome as an Architectural Form." The purpose of the paper, it was explained, was to bring into the general æsthetic character of the dome, and more particularly to vindicate for it a place among the architectural forms suited for a Christian church. The main characteristic of the dome in general was its embracing, uniting quality, an important so to employ it as to obtain from it its full unifying element in a composition. The employment of the dome as a mere roof, as in the multiplied domes of Byzantine churches, such as St. Mark at Venice or the cupolas along a rectangular aisle as in churches of the Middle Ages of France, was not the way to secure all the advantages of the dome, its most beautiful and expressive feature. The dome, when properly employed, lent distinction to a building, and it was rightly pronounced to be on the whole the most satisfactory form for the æsthetic sense of all architectural forms. The real value of the dome was, however, only exhibited when it was allowed to exercise an influence far beyond the limits of its own circumference, and brought into harmony the elements of a subdivided plan. The Pantheon of H. Rome, the starting-point of the development of dome construction in the modern world, completely embraced the plan it surmounted, but this plan was that of an unbroken circle. The Christian builders desired to use the dome for their own purposes; but such a plan as that of the Pantheon was not suited for a Christian meeting-house. One of the most interesting chapters in the whole history of architecture was occupied with various experiments by early Christian architects to adapt the dome to the requirements of congregational worship. Their efforts to overcome the difficulties presented by themselves were sufficient proof that they recognised the dome as a form not only beautiful in itself, but expressive of Christian ideas, and this was a consideration too often lost sight of by the Mediaevalists of the Middle Ages, who, as the discussions connected with the new L. Cathedral had shown, were still dominated by the ideas embodied in the Gothic Revival of the first half of the nineteenth century. The efforts referred to were ultimately crowned with success, when the architect of Justinian's church at Sophia at Constantinople combined the dome with the angular ground plan normal in the Christian meeting-house. It was a curious fact that after Sta. Sophia the plan of domed churches retrograded, and small cupolas were employed over the arms and intersection of Greek crosses, or disposed like the five on a domino over a square. Some later architects, however, seemed, however, to show a revival of the tradition. Meanwhile, other points of interest in the history of dome construction emerged, the chief of which was the employment of the cupola in later Byzantine architecture, and again in the Renaissance as an external rather than an internal feature. There was a fine field open for the efforts of the architect in the direction indicated by Sta. Sophia, the triapsidal plan, that could be effectively combined with the dome, offered opportunities for experiments, and these would result in a centralised church for congregational purposes, free from the suggestion of mystical sacerdotalism which characterised the Mediaeval fane, and recalling the glories of some of the early Christian domed structures that had passed away. Architectural students who went to Cologne would shortly stay in the Gothic cathedral, and spend more time in S.

the Capitol or the Apostles' Church, some fresh and promising elements might be imparted into the church architecture of the day. Some discussion followed the reading of the paper, which was illustrated by numerous lantern slides, drawings, &c., and at the close Professor Baldwin Brown was accorded a cordial vote of thanks.

### TESSERÆ.

#### The Owl in Art.

THE Egyptians represented Minerva under the form of an owl, whence the respect of the Athenians, and their opinion that the appearance of this bird was a favourable omen, all other nations deemed it bad. The owl was anciently, however, an omen of death. Upon coins it was the symbol of wisdom and her colonies, because it was that of the patroness Minerva, and the vases upon which it is placed imply (as is evidenced), the invention of vases of pottery, of which the Athenians boasted. An owl upon an altar, which occurs upon the coin of Nero, the Baron de la Bastie, justly rejecting Jobert's opinion, thinks a particular sacrifice offered to Minerva, from a But from the same type occurring upon a coin of Constantine, with the legend "Sapientia principis providissima," and from another of Trajan, published by Seguin, when an owl is placed upon that prince's column, it is more properly deemed a piece of low flattery, as being the symbol of wisdom to the emperor. The owl with two bodies and one head upon some Greek coins is not satisfactorily explained.

#### Celtic Standing Stones.

The most simple form of Celtic monuments is the Maen-hir, or long-stone, called also Peulvan, or stone pillar. This is without the earliest, as it is the simplest form of monument, and was erected to commemorate a victory, or to mark a boundary, or to denote the resting-place of some person of importance. These single stones are found in all countries, and we find notices of them in Holy Writ. Many of them now may be seen the remains of more extensive monuments which were destroyed when Christianity overthrew the ancient paganism, the decrees of councils of the Church were directed against such like monuments; A.D. 452 the Council of Arles, A.D. 567 the Council of Toledo, threatened with excommunication any bishop who would not use his influence to destroy all objects of idolatry, among which stones are enumerated. Chilperic in his edicts enjoins the destruction of the stone monuments which cover the land, and the Anglo-Saxon laws forbid the burial of stones. These stones afterwards were converted in many cases to Christian purposes, and have been used as monumental stones. Many exist in this island with the names of the sons of British or Romano-British extraction carved upon them, and a very remarkable monument of this kind exists at Joinville, in the department of the Meuse, on which is inscribed VIROMARVS ISTALIF, *i.e.* Viromagus, son of Istalus, which perhaps commemorates a Gaulish chief subject of the Roman power.

#### The Five Orders.

The real beauty of such proportions as are exhibited by the orders of architecture is not greater than that which we feel in the cases where we perceive means properly adapted to their end, and the admiration we feel from the prospect of the orders of antiquity is necessarily to be ascribed to other causes besides these proportions. The common people undoubtedly feel a very inferior emotion of beauty from such objects to that which is felt by men of liberal education, because they have none of those associations which modern education so early connects with them. The man of letters feels also a weaker emotion than that which is felt by the artist, the artisan, or the architect, because he has none of the associations which belong to the art, and never considers them in relation to the genius, or skill, or invention which they display. Deprive these orders in the same manner of their many ornaments and leave only the great and governing proportions, or change only in the slightest degree their forms without altering these proportions and their beauty will be in great measure destroyed. Preserve, on the other hand, the proportions of the orders, but diminish in a great degree their scale, and though they will still be beautiful, yet their beauty will be infinitely inferior to that which they have upon their usual scale of magnificence. It is possible in the form of a candlestick or some other trifling utensil to imitate with accuracy the proportions of these orders. It is possible in many of the common articles of furniture to imitate some of the greatest beauties of this art. But who does not know that their beauty in such an employment would be lost? Yet still the proportions are the same, if their proportions are the sole cause of their beauty. Destroy in the same manner all the associations of elegance, of magnificence, of costliness, and more than all, of antiquity, which are so strongly connected

with such forms, and every man will acknowledge that the pleasure which their proportions would afford would not, in fact, be greater than that which we feel in other cases where means are properly adapted to their end. The uniform adherence of mankind to these proportions is said to be in itself a sufficient proof of their sole or absolute beauty. Many other causes of this adherence may be assigned, and these causes are sufficient to account for the effect, without supposing any peculiar law of our nature, by which such proportions are originally beautiful. They who have had opportunities of remarking the extensive influence which the associations of antiquity have upon our minds, will be convinced that this cause alone has had a very powerful effect in producing this uniformity of opinion, and they who consider that the real effect of proportion is to produce only a very moderate delight, will easily perceive that an almost insurmountable obstacle has been placed to every invention or improvement in this art, when such inventions could oppose only a calm and rational pleasure to that enthusiasm which is founded upon so many and so interesting associations.

#### The Scientific Work of Leonardo da Vinci.

Leonardo da Vinci has long been recognised as the rival of Michel Angelo and Raphael. It is only of recent years that the publication of his writings has made him known as at once a theoretical reformer and a practical man of science. Among his discoveries his Italian editor, Venturi, refers to the attainment, and in most instances the establishment by proof, of correct theories (a) in mechanics—of the equilibrium of the lever under the action of oblique forces, friction and resistance, the influence of gravity on bodies in repose and motion, the descent and ascent of bodies on inclined planes, the relation of initial force to speed, and of the motor power of machines to the weight of the bodies moved; (b) in optics—the camera obscura, the laws of perspective, the nature of coloured shadows, the figure of light from the sun (which baffled Aristotle and was afterwards explained by Maurolycus), the movements of the iris, and the duration of visual impressions; (c) in hydraulics, he anticipated the observations of the astronomer Castelli on moving waters; and (d) in atmospheric chemistry demonstrated that respirable air must support flame; (e) in astronomy he distinctly assumes (in a treatise of 1510) the annual rotation of the earth, and refers to it as a common opinion of his time; he found before Maestlin that the obscure light of the unilluminated part of the moon is due to the reflection of the earth, and knew of the elevation of the equatorial above the polar waters; (f) in geology he had advanced so far as not only to assert, but on grounds of modern reasoning to demonstrate that the sea had once covered the tops of mountains on which shells had been discovered. Leonardo, theoretically as well as practically, understood and wrote well on fortification, architecture and the art of painting.

#### Greek Architecture.

In considering a work of art as a whole, harmony is the first quality to be sought, for it is simply the co-operation of all the parts in the production of the desired effect, and it is exactly in the production of this effect that æsthetic character consists. In working this out the Greeks were super-excellent, and thus vindicated their title to be considered great artists, in spite of the narrowness of their architectural ideas and the very slight amount of variety permitted by the type of horizontal construction which they exclusively favoured. They succeeded in making the very most of the resources which this construction afforded, and to this day remain absolutely unrivalled. We must not suppose, however, that their art displayed no variety. Besides the diversities which characterised their three principal orders, they were able to obtain variety by changing the numbers, the disposition and the spacing of their columns. They even ventured to disregard symmetry when they thought it could be done with advantage. They substituted a circular form for the usual rectangle in many of their monuments. But still we may fairly say that one aspect pervades the great majority of their structures. The spirit of Greek architecture may be compared to the poetic system of Sophocles. Euripides, on the other hand, had no sympathy with it. It was pure and logical rather than grand or picturesque.

#### Livy's House in Padua.

No persons have ever been more delighted with antiquities of their own manufacture than the Paduans. The Gothic tomb of Atenor attracted for a long period the patriotic veneration, and the house in which Livy was born was exhibited with pride to the stranger. "In this town," says Evelyn, "is the house in which Titus Livius was borne, full of inscriptions and pretty faire." Coryate likewise visited this mansion in 1608, and has given in his usual quaint style the reasons for his belief in its genuineness. "Amongst other very worthy monuments and antiquities which I saw in Padua the house of Titus Livius was not the meanest; for had it been much worse than it was I should have esteemed it precious, because it

bred the man whom I do as much esteeme, and whose memory I as greatly honour as any ethnic historiographer whatsoever, either Greeke or Latin, having sometimes heretofore, in my youth, not a little recreated myself with the reading of his learned and plausible histories. But seeing I now enter into some discourse of Livie's house, methinks I heare some carpinge criticke object unto me that I do in this one point play the part of a traveller, that is, I tell a lie; for how is it possible (perhaps he will say) that Livie's house should stand to this day, since that yourself before have written that Padua hath been eftsoones sacked and consumed with fire? How cometh it to passe that Livie's house should be more privileged from the fury of the fire than other private houses of the citie? I answer thee that it is very probable this building, whereof I now speake, may be the very house of Livie himself, notwithstanding that Padua hath been often razed and fired." Omitting, however, his arguments here, he thus concludes:—"For the very same house, wherein he lived with his family (as many worthy persons did confidently report unto me) and wrote many of his excellent histories with almost an incomparable and inimitable style, I saw, to my great joy, being in a certain street as you go from the Domo, which is the cathedrall church, to the gate Saint Johanna."

#### The Goethe-Schiller Group, Weimar.

The double statue of Schiller and Goethe which stands before the theatre in the Carlplatz gives it a dramatic character which it does not possess of itself. This statue, like all other statues which we have ever seen or heard of (except that of the superb Frederick the Great at Berlin), has had its detractors; and yet, assuredly, it is a work of art which improves upon prolonged acquaintance, which is not the least praise which can be given to a work of art. The two great poets are plainly clad in the usual dress of the period, whose merits are of a negative kind. Certainly a Roman toga would have enveloped them more gracefully, but it would have been an anachronism, and, so far, in bad taste. The statue has excited ridicule, because Goethe appears to be taking care of Schiller, or to be in a manner his keeper. But the idea is perfectly compatible with the respective characters of the poets, and with their mutual relations while alive. Goethe appears master of the world, as well as thoroughly at home in it. His brow is open, unabashed and dauntless. He stands well on his legs, and his portly figure indicates a sound constitution, good lungs and green old age. His manner is at once composed and unrestrained. He stands perfectly upright, and yet perfectly at ease. On the other hand, the position of Schiller indicates bodily languor and weakness, combined with enthusiasm and mental vigour. His breath appears to be drawn with difficulty, and his head is set somewhat forward on the shoulders. His brow and face appear illuminated with intellectual light, while the traits betray an expression of physical pain. He is in the world but not of it; he seems to be stretching out of it in endeavour to discover the secrets of the infinite. The one just, in fact, appears the complement of the other. They typify the two schools of classical and romantic poetry, not that they exclusively treated of subjects belonging to one or to the other, but that they treated all subjects, each in his own manner—Goethe sensuously, Schiller spiritually. The brotherly embrace of the group denotes that there can be no sharply drawn division between the two schools; and, in fact, the word schools is less appropriate than that of tendencies or points of relation.

#### GENERAL.

**Mr. George Frederick Bodley** was on Wednesday evening elected a Royal Academician. The choice will give general satisfaction to architects. Mr. M. R. Corbett, painter, was elected an associate of the Academy.

**Mr. T. G. Jackson** has contributed to the *Guardian* an article *apropos* of the Liverpool Cathedral. He recommends the adoption of bold spans—domes it may be—less encumbered floor space, greater simplicity of plan, and larger liberty to the architects in design. In that way the Gothic will be expressed, in spite, perhaps, of domes and round arches. But no bygone style can ever really be made to live again.

**The Will** of Mr. W. R. Kinipple, M.I.C.E., whose death at Brighton we recorded, has been proved at 18,881*l*.

**An Exhibition** of the works of Falguière, the sculptor, is about to be held in the Ecole des Beaux-Arts, Paris. The arrangements are being carried out by a committee under the direction of M. Paul Dubois.

**A Committee** has been formed to carry out repairs to the tower of Selby Abbey. The upper stones will be removed to lighten the weight on the foundations. The tower will be made similar to the one at Ripon and Peterborough Cathedrals.

**Portsmouth** is going to celebrate the Coronation by erecting a statue of Queen Victoria. The Mayor, having discussed the matter with Mr. A. Drury, A.R.A., found that a statue 11 feet high of the late Queen would cost 1,000*l*, granite base and bronze memorial tablet would cost 350*l*. On the three remaining sides of the base could be placed sized medallions of Dickens, Besant and Brunel. These cost another 350*l*, thus bringing the total cost up to 1,700*l*. Subscriptions are now being sought.

**M. Duval**, architect, has prepared his report on the cost of the structure on the stage of the Variétés Theatre represented Charles Garnier's staircase in the Opera. Several actors were seriously injured. It is shown that the accident was owing to carelessness, for which responsibility will have to be assumed.

**Eighteen Pounds Ten Shillings** per square foot was the price at auction for a freehold site at the corner of Bride Lane and Fleet Street, E.C. The total area was 550 square feet at a price 23,150*l*.

**The Death** is announced of M. Adrien Gaudet, the sculptor, of Lyons. He was a pupil of Joffroy. Several works were purchased by the State and Paris Municipality.

**At Leighton House** on Wednesday a course of six lectures began, entitled "A Brief History of the Art of Painting from Cimabue to Leighton." They will be delivered by Mr. W. Fry, member of the Royal Society of British Artists, and will be illustrated by numerous lantern slides.

**By the Will** of Mrs. Morris, wife of Mr. William Morris, the executors are to offer to the Trustees and Directors of the National Gallery the pictures by her late husband "The Shadow of Snowdon," the "Lime Avenue in Clonsilla Park," and a water-colour drawing, "On the Ribble." They are also to offer to the Lord Mayor and Corporation of London the pictures of "A Hampshire Home," "A View of Loughrigg Tarn and Langdale Pikes," "Dunham Castle," "The Chapel Rock," "The Bridge at Dunkeld," and "Beachey Head."

**The Decorations** prepared by Mr. C. W. Furze for the Liverpool Town Hall will shortly be exhibited in the Victoria and Albert Art Gallery, and also three models for the national monument to Queen Victoria.

**Mr. Balfour** has announced that a writ and statement claim on the part of the Attorney-General, and relating to gold ornaments found in Ireland, have been served on the defendants (the Trustees of the National Museum) have now to deliver their statement of defence.

**Workmen**, while making some excavations in the pavement of a convent school at Poitiers, came upon a statue of Mary 5 feet high, in white marble, dating from the second century.

**Mr. John Murdoch**, formerly a plumber in Dundee, has bequeathed nearly 70,000*l* for the provision of relief to the poor, bachelors and widowers. It is recommended that a building be erected thereon, to be known as the "Murdoch Rest," such persons may end their days in comfort, and the building shall be after the cottage system. It is desired that the applicants shall have shown a practical sympathy with the pursuits of science in which the donor has interested himself.

**Cardinal Vaughan** has decided to open the new Cathedral at Westminster on June 29 next, three days before the King's Coronation, provided nothing unforeseen should prevent the ceremony. Lady Vavasour has intimated that she will present a costly mosaic of the Welsh saint Winefride, towards the interior decoration of the building.

**The French Society** of Artists-Decorators now counts over 300 members. The second general meeting has been held under the presidency of M. Dubufe and under the vice-presidency of M. Louis Carrier-Belleuse.

**The Annual Dinner** of the Plymouth, Devonport and Stonehouse branch of the Devon and Exeter Architectural Society was held last Friday, with Mr. C. King in the chair. Among the guests was Mr. Silvanus Trevail, who admitted the Society of which he is President were not careful at first in beginning about inquiring into the qualifications of the candidates for membership.

**Professor Corfield**, consulting sanitary adviser to Her Majesty's Office of Works, has been directing considerable improvements in the sanitary arrangements of the south part of Windsor Castle. The whole of the drains under the south towers, from Edward III's Tower to the Victoria Tower inclusive, have been done away with, so that there is no drain under the buildings on that side of the Castle, and watertight iron drains have been laid outside the buildings. Suitable disconnection arrangements have been provided between the new drains of these towers and the Castle sewers, so that each of the towers is, in fact, so far as the drains are concerned, a house in itself.

EDITORIAL NOTICES.

*view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

**ALDERSHOT.**—March 1.—Plans are invited for laying-out a pleasure ground about 6 acres of land in the centre of Aldershot. Mr Nelson F. Dennis, A.M.I.C.E., surveyor.

**ALDERSHOT.**—March 29.—Competitive plans are invited for proposed public offices, fire-station and town hall for the town. Premiums of £100, £75 and £50 will be awarded for first, second and third best plans. Mr. Nelson F. Dennis, M.I.C.E., surveyor.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West-minster.

**HARROGATE.**—May 14.—Competitive designs are invited for a new town hall, the cost of which must not exceed 40,000l. Premiums of 150l., 100l. and 75l. are offered for the three selected designs. Mr. F. Bagshaw, borough engineer, Municipal Offices, Harrogate.

**IRELAND.**—Feb. 26.—A premium of £20 is offered for the best and cheapest report, plans, specification and estimates, &c., for providing the town of Kanturk with a wholesome supply of water. Mr. Mt. Timothy Guiney, clerk to the Kanturk Rural District Council, at the Boardroom of the Workhouse.

**LANGHO.**—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200l., 150l. and 100l. respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**MONTROSE.**—Feb. 15.—Suggestions are invited for an ornamental fountain to be erected in the Mid Links of Montrose in memory of the late Provost Scott. Price must not exceed 150l. Mr. A. Middleton, solicitor, Montrose.

**NEW MALDEN.**—March 5.—Designs, &c., are invited for public offices, fire-station, cart sheds, stables and mortuary to be erected at New Malden, Surrey. Total cost of buildings not to exceed 5,100l. Premiums of 25l. and 10l. respectively are offered for the best and second best design. Mr. C. T. Lewis, clerk to The Maldens and Coombe Urban District Council, 7 Market Place, New Malden.

**STAKEFORD.**—Plans, specifications and estimates are invited for the erection of a bridge over the river Wansbeck at Stakeford, in the county of Northumberland. Mr. E. E. Charlton, 32 Grainger Street West, Newcastle-upon-Tyne.

**WALES.**—Feb. 4.—Competitive designs are invited for municipal offices proposed to be erected by adapting, adding to and rearranging the town hall buildings at Mountain Ash. A premium of 75l. will be paid to the author of the design placed first in order of merit. Mr. H. P. Linton, clerk, Town Hall, Mountain Ash.

CONTRACTS OPEN.

**ACCRINGTON.**—Feb. 17.—For erection of shops, offices, stores and assembly-rooms. Messrs. Haywood & Harrison, architects, Post Office Chambers, Accrington.

**ALDRETH.**—Feb. 14.—For erection of a bridge at Aldreth, over the West River. Mr. Herbert Leete, county surveyor for Isle of Ely, Ely.

**ANNFIELD PLAIN.**—Feb. 1.—For shop fittings for new shops, &c., Annfield Plain, Durham. Mr. G. T. Wilson, architect, 121 Durham Road, Blackhill.

**AVONMOUTH.**—Feb. 17.—For construction of a new dock having a water area of about 30 acres, with an entrance lock and entrance channel from the river Severn, a graving dock, embankments, sea-walls, &c. Mr. W. W. Squire, engineer, Underfall Yard, Cumberland Road, Bristol.

**BARNSELY.**—Feb. 5.—For erection of two steel lattice girder bridges respectively required for supporting the lines of cast-iron socket pipes across the river Porter, or Little Don, near Deepcar Bridge. and across the river Don, near Soughley Bridge. Messrs. T. & C. Hawksley, civil engineers, 30 Great George Street, Westminster, S.W.

**WOLVERHAMPTON.**—Feb. 10.—For erection of a car-shed and offices, &c., at Bilston, Staffs. Particulars may be obtained from the Secretary, the Wolverhampton District Electric Tramways, Limited, Donington House, Norfolk Street, Strand, W.C.

**WREXHAM.**—Feb. 18.—For reconstruction of the main lantern lights along the roof of the butchers' market, &c., and reconstruction of market sanitary arrangements and conveniences. Mr. Thomas Bury, town clerk, Guildhall.

A SERIOUS building scaffold accident took place last week in Sauchiehall Street, Glasgow, by which two painters were injured, one seriously. It appears that the injured men were at work on top of a scaffold supported on high trestles, when a ladder skidded on the damp pavement, and caused the entire erection to fall. Both men were precipitated to the ground, and were picked up in an unconscious condition. They were conveyed to the Royal Infirmary, where one is progressing favourably. The condition of the other is, however, serious.

## TENDERS.

TIMBER TRADES' BENEVOLENT SOCIETY.

THE fifth annual meeting and election of this Society was held on Monday at the Cannon Street Hotel, Mr. D. J. Morgan, M.P., president, in the chair. The report stated that although the past year had been a disastrous one for the timber trade generally, the Society had fortunately not suffered a great loss of income, the subscriptions being only about 4½ per cent. below those of 1900, while they were 15 per cent. over those of 1899. The board had been enabled to add 1,145l. to the invested funds, which now amounted to 13,479l. Two pensioners had died during the year, and three were to be elected that day, which would bring the total up to 16. The amount distributed last year in pensions was 532l. and a sum of 192l. was given in the shape of temporary grants to urgent and deserving cases. The report was adopted, and the meeting proceeded to the election of pensioners.

**LEECH'S PATENT WELTED STEEL CISTERNS.**

WE have recently inspected some specimens of a new patent cistern which the Blackwall Galvanised Iron Company are now placing on the market, and as they possess several points of excellence we think our readers will like to know something about them. Their novelty consists in their being made of smooth black steel, welted by special machinery and afterwards galvanised in the best Silesian spelter.

As the sketch shows they are of very neat finish; they are also of exceptional strength and durability; the method of manufacture insures perfect and unbroken joints; no caulking is needed, as each corner is of quadruple thickness and rounded off on the inside, and owing to this and the fact that there are no rivets, they offer no interstices for the lodgment of dirt or impurities. They also claim advantage from the point of view of cheapness, and they will be stocked in all sizes up to 150 gallons, and in various gauges.

**DRAUGHT PREVENTERS.**

WE have received a communication from Mr. Edward A. Harman, M.Inst C.E., of Huddersfield, in which he says:—

In workshops, messrooms, bathrooms, mills and large factories, the doors into the separate rooms frequently admit a furious draught. Various draught preventers, patent and otherwise, have been tried, but perhaps one of the simplest extant is that of a roller about 2 or 2½ inches diameter, of the

width of the door, attached to the inside of it by means of a lug having vertical slots in them, instead of a circular hole. The small axle of the rollers thereby being allowed to slide freely up and down in the slot, and thus allow for any irregularities in the floor. The contrivance is a very simple one, is capable of being adapted to the doors of outer kitchen, lobbies, sheds, &c., with a considerable reduction in draught space available. It is really like a towel-roller placed on the floor. Care should be taken in fixing it that the permit of the rollers being practically close to the door when fixed and that they rest upon the floor. The author has taken the above arrangement for some years with considerable success and comfort. In some cases the roller may be threaded in several pieces about 3 inches in length on an axle. Manifestly the small reels work more freely than a long one. Though only a trifling detail, yet details are of importance.

**AUSTRALIAN HARDWOOD FLOORS AND DOORS.**

SOME particularly important tests have this week been undertaken by the British Fire Prevention Committee, the occasion bringing together an unusually large assemblage of public officials, architects, surveyors and engineers, including several representatives of the Continent. The visitors were received by Mr. Edwin O. Sachs (chairman) on behalf of the Executive Committee, and Mr. H. H. Collins (district surveyor for the City of London) on behalf of the Council, and among those present were noticed Commander Welsch, who had arrived from Ghent on behalf of the Belgian Government, and Major Fox, of the London Salvage Corps, whilst there was also a specially strong representation of the fire insurance offices.

Preceding the general reception a luncheon was given to the executive, at which, in the course of the toasts, it transpired that a scheme was on foot for utilising the results of British tests abroad. Mr. Sachs, Mr. Collins and Commander Welsch spoke on this subject at some length.

The particular test which occasioned primary interest was that of a large warehouse floor of Karri and Jarrah wood comprising supports of timber, beams of timber and a floor of timber, the whole carrying a load of 200 lbs. per square foot and being subjected to a fire of gradually increasing temperature up to 2,000 degs. Fahr. for a period of two hours.

Another test was with Karri and Jarrah hardwood doors

ch thickness subjected to a similar fire of increasing severity the period of one hour.

The tests, which commenced at 12.30, lasted until 4 P.M., were favoured with exceptionally fine weather, but, owing to severe frost, the hose-pipes by which water was applied to the end of the large floor-test became frozen, and it was a sure to see how some men of the London Salvage Corps, were in attendance on Major Fox, came to the rescue with 3-pumps in their usual smart way.

### ELECTRIC NOTES.

A meeting of the Hull electric-lighting committee of the Corporation, in reply to an application from the School Board, is stated that the mains to the several schools would be free of charge, and the supply would be at the same rate as that of ordinary customers, the cost of the mains being estimated at 4,000*l*.

The site of the generating station for the Inner Circle when converted to electric traction has been acquired, and the construction of the station will be immediately commenced. The station will be built in Lot's Road, Chelsea. The work of lining the tunnels and installing the plant will not, however, be started for some time—probably two or three months—but all probability it will be finished simultaneously with the generating station, in approximately two years' time.

As the result of the municipal working of the electric trams and the electric lighting of Liverpool it has been found for the year 1901 there are considerable net profits, amounting in the case of the tramway system to 52,000*l*., and that of the lighting system to 24,000*l*. The respective committees have decided to devote 25,000*l*. to the relief of local rates, the result of which will be a reduction in the rating of the city of 2½*d*. in the pound. It is also proposed to reduce the charge for electric light from 4*d*. per unit to 3½*d*.

MR. A. A. G. MALET, inspector of the Local Government Board, held an inquiry at the Hunningley Lane Board schools, Liverpool, into the application of the District Council for permission to borrow 4,445*l*. to complete the works of sewerage disposal. Mr. McCallum, the engineer, was cross-examined by Mr. Jos. Tomlinson, a ratepayer, as to whether or not the boring done ought not to have altered the state of the land, but he argued that it was quite

impossible, from the quantity of boring done, to obtain accurate knowledge of the state of the subsoil.

At Alloa, N.B., on the 16th inst., the bailies and councillors of the burgh, and a large number of ladies and gentlemen, witnessed the formal inauguration of the electric lighting of the principal streets of the town. The first of the massive engines for working the dynamos was started by Mrs. Landor, wife of one of the directors; the second by Mrs. Stewart, wife of Mr. Stewart, chairman of the Electric Plant Company; the arc lights in the works being switched on by Mrs. Arrol, wife of Bailie Arrol. The company afterwards adjourned to the Municipal Buildings, where a cake and wine banquet was provided by the provost, magistrates and councillors.

THE electric current has been credited with being the cause of a large number of fires, and it seems only right it should atone for its delinquencies in dealing out destruction by being also commandeered into service for extinguishing fires. This consummation of ingenuity has been attained by Messrs. Merryweather & Sons, of London, who supply machines actuated by the current that project powerful jets immediately on the discovery of a fire. This system has been applied to Hatfield House, Stanford Hall, Norbury Park, and other country houses. The quickness with which the whole thing can be put into action commends the arrangement as a supplement to or even as a substitute for ordinary fire-extinguishing appliances.

At a meeting of Hamilton (N.B.) Town Council on the 14th inst., the joint committees on streets and electric lighting recommended that the poles in connection with the proposed electric tramway should be utilised, lamps to be fitted on the centre poles, and hanging lamps on the side poles, with the McKenzie base for accessories, at an estimated cost of 83*l*. This was agreed to. The electric-lighting committee reported that they had considered two offers by electric-lighting companies to carry out the electric lighting of the burgh, but in view of the opinion of their engineer, the committee recommended that the Council should carry out the work. In moving the adoption of the report, Mr. Meechan, convener of the committee, argued strongly against giving their territory away to any private company which would compete against the gas-works.

THE Abingdon Town Council having applied to the Local Government Board for approval of the sale of so much Con-

# TAYLOR'S PATENT JUNCTION

No. 12662.

For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.

APPROVED BY ALL SANITARY AUTHORITIES.

This junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the angles required for the various makes, also to avoid the necessity of having joints inside the walls, which are not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can be of any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this. It only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint, necessary is to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back Pipe ½ inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left. With all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property, causing other inconvenience.

Shows the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.

Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.

Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in. x 1½ in. Invert Junction for Anti-siphon Pipes, &c.

Shows how to arrange for a small sized branch.

in Three Strengths—Ordinary Rain Water, ½ and ¼ Metal.

DETAILS AND PARTICULARS CAN BE HAD AT ALL WHOLESALE MERCHANTS, OR FROM

WILES TAYLOR, R.P., Sanitary Engineer, ECCLES, MANCHESTER.

solidated Stock as will produce the sum of 898 $\frac{1}{2}$ ., and the appropriation of the sale proceeds in defraying the cost of the extension and improvement of the cattle market, Lieut.-Colonel A. C. Smith, R.E., held an inquiry at the Council chamber on the 21st inst. The town clerk explained that the money was required to purchase eight cottages at a cost of 425 $\frac{1}{2}$ ., a piece of ground for 100 $\frac{1}{2}$ ., and to erect additional pens, &c., to meet increased requirements in connection with the market, which had considerably increased since the Corporation acquired the original site some fifteen years ago. The mayor, Alderman Morland, said that the Council contemplated the expenditure for the general good of the town by extending the market, which must bring trade to the town. At the close of the inquiry, at which there was a small attendance, the inspector visited the market.

THE Harrogate Corporation have for some months past had under consideration a sewerage scheme, and had practically decided upon adopting a comprehensive one to do away with the existing farms and treat the sewage on land near to Ribston. At the invitation of the Corporation, Mr. C. Fox Strangways, geologist, has been making a survey of the district, and in face of his report the committee have been reluctantly compelled to abandon the comprehensive scheme, because of the necessity of having to drive a tunnel, there being a probability of interfering with the Harrogate springs. The committee have decided to recommend the Council to adopt a scheme whereby the sewage of the southern portion of Harrogate will be treated near Ribston, and that of the northern at Bilton. This will mean the dividing of the scheme, the abandonment of the present sewage farms, and will not necessitate the driving of a tunnel. The Knaresborough Urban Council and the Knaresborough Rural Council, however, object to the Bilton scheme, and will oppose it.

AT last week's meeting of Plympton Rural District Council the small-pox committee reported having obtained offers for five sites suitable for the purpose of erecting a hospital on terms which they considered would be acceptable to the Council. The committee desired to have power to close with one of these offers after further negotiations with vendors, either to buy or obtain a lease. The committee had also considered the erection of a hospital, and thought a corrugated iron building with twelve beds, nurses' quarters, kitchen, laundry, &c., also mortuary and ambulance shed, should be provided, the cost of which will be about 720 $\frac{1}{2}$ ., exclusive of land, fences and drains. The committee thought this amount might be divided into

three yearly instalments. The committee asked to be empowered to arrange for the construction of such a hospital with the least possible delay. Mr. W. J. Woollcombe, moving the adoption of the report, said the provision of hospital was extremely important, and the Council must find that it could not be postponed. It was necessary that the Council should deal promptly and in a business-like way with the matter. To complete the scheme the cost would be between 900 $\frac{1}{2}$  and 1,000 $\frac{1}{2}$ . Mr. Giles seconded, and the report was adopted.

THE annual return of electricity undertakings provides material for an interesting comparison between company and municipal management. There were 271 urban electric-light businesses last year, of which 181 were under municipal control and 90 under companies, so that, so far as numbers go, public enterprise has much the best of it. The average profit made by companies was 5 per cent., and by municipalities 4.30 per cent. The average charge made to consumers under companies was 4.94 $\frac{1}{2}$ d per unit, and under municipalities 3.82 $\frac{1}{2}$ d per unit. The public therefore makes 70 per cent. less profit than private enterprise, but far more than makes up for this by having to pay 20 per cent. less for its light.

THE Bath City Council have under consideration a report from an inquiry committee which has been sitting with instructions to investigate the past history and future of the electric lighting undertaking, consequent upon the failure last November and the generally unsatisfactory condition of the undertaking. The published report, which includes that of Mr. Manville (Kincaid, Waller & Manville), who was called in to give expert advice, comprises 124 pages. The committee severely criticise the management of the undertaking by the committee which has been superseded. The first cause of accidents which had occurred is the defective system adopted by the old company and perpetuated under the Corporation management. They find further that the whole of the high tension mains laid up to the end of February 1901 are of an obsolete type, the value of the concentric cables having been fixed and established for many years previous to this date. The switchboards were bad in design, and should have been replaced some time ago. The committee find that the failures were a necessary incident of electric-light production, and might have been avoided; but they advanced the proposition "that with properly equipped works and capable management electric lighting is a safe and profitable investment, and is being carried on successfully by numerous public bodies."

ious parts of the country." Mr. Manville, in his recommends the Council to reconstruct the works cost of 70,000*l.*, which would also allow of the ing annually of 23,800 more eight candle-power lamps. imates a total income of 18,370*l.* The working expenses be 8,125*l.*, leaving a gross profit of 10,245*l.* The it and repayments on the present loans (amounting to *l.*) is 5,732*l.* annually, and on the prospective loan of *l.* it would be 4,200*l.*, leaving a net profit of 312*l.* This only be when the 23,800 more lamps were connected. Manville advises the Corporation that a further profit be made if they undertook to supply current to the tram-company, to do which a further capital outlay of 6,000*l.* be necessary.

## BUILDING AND BUILDERS.

st week's meeting of the Hull watch committee it was d to advertise for tenders for the erection of the pro- new police-station. The plans have been for some time eted, and the building, which will be on the south side of w street running from the Town Hall to Whitefriargate e, will have a fairly imposing appearance. The cost of the ng will, it is expected, be about 25,000*l.*

IE foundation-stone of a new church at Fairhaven, m, has been laid. The church, which will be known as ul's, Fairhaven, is to be built on a site given by the lord manor, Mr. J. Talbot Clifton, who has also contributed er annum towards the endowment. The architect is Mr. and Taylor, of Manchester. The seating accommodation e for 450 and the cost of the nave, chancel and south aisle to be built) about 6,000*l.*

THE annual exhibition and competition in connection with the Border Counties Master Painters' Association took place last week in the Burns Hall, Galashiels. The prize competitions for apprentices and journeymen were well supported, the work sent in being of a high standard, and in many cases competition was so close that the judges had great difficulty in deciding the prize-winners. The gold medal for general excellence of the work exhibited by apprentices, presented by Mr. Latto, president of the Scottish National Association of Master Painters, was awarded to Mr. J. Archibald, Galashiels.

THE memorial-stone of the new Hutchesontown (N.B.) Congregational church was laid on the 25th inst. The new buildings occupy a site adjoining the old iron church, and they have an attractive frontage in Rutherglen Road. Messrs. James Salmon & Son, 53 Bothwell Street, Glasgow, are the architects, and the style is Gothic, based on the old colleges of Cambridge. The church is situated at the back, and has seating accommodation for over 400 persons, and in the front portion of the buildings there is a large hall, with seating accommodation for 250, and a couple of smaller halls, capable of seating 70 and 50 persons. The total cost of the buildings is estimated at over 3,000*l.*

## VARIETIES.

A NEW mission church erected at Castle Street, Edgeley, Stockport, in St. Matthew's parish, has been opened. The structure has cost 500*l.* It will seat 500 persons.

A NEW Independent Methodist church was opened on the 19th inst. at Stockton Heath, near Warrington, by the president of the Connexion (Mr. John Crumblehulme, of Bolton). The cost is 1,200*l.*

THE Cheltenham general purposes committee has reaffirmed its recommendation to the Town Council to buy the Lloyds Bank site for the erection of municipal offices. The work in connection with the new municipal concert hall has been begun.

As a steam roller was passing over a bridge on the river Brain at Braintree the structure gave way. The driver, hearing a crash below him, shut off steam and leapt out of danger as the roller sank through, carrying timbers and masonry before it. Happily, no one was hurt, but the damage was considerable.

200-215  
TOTTENHAM COURT ROAD  
(Opposite Goodge Street),  
LONDON, W.

THE restoration has now been completed of the Yateley Church porch. A new Portland stone floor has been fixed, and two oak benches have been added, one on each side. On the upright beam above the outer arch, an antique wooden figure of St. John the Evangelist carrying a Bible in his right hand has been placed. An oak door, recently put in the Norman archway, completes an excellent restoration of the porch, which has been carried out at a cost of 85*l*.

SIR JOHN NEILSON CUTHBERTSON, chairman of the School Board, Glasgow, recently opened the new Central School, Perth. The new school has accommodation for 620 children, and comprises ten classrooms, apart from teachers' rooms, while it is fitted up with the most modern sanitary, heating and electric-light arrangements. The company afterwards proceeded to the Caledonian Road school, where Sir John formally opened a new workshop, cookery-room, laundry and gymnasium. The total cost of the new school is 12,970*l*., while the cost of the extension at the Caledonian Road school is estimated at about 500*l*.

AT the annual meeting of the Hawick Archaeological Society on Tuesday evening Dr. Brydon, the president, spoke on the archaeology of the district. The Society, he said, had had a very prosperous year. The papers had been numerous and valuable, the attendance at the monthly meetings good, and some interesting contributions had been made to the museum. The district was rich in archaeological remains, and afforded ample scope for antiquarian research. In addition to a group of about fifty hill forts or camps there was the Catrail, extending many miles, besides the Moat, numerous border towers and peels. He was greatly in favour of the Moat being tunnelled with the view of ascertaining its nature.

ON the afternoon of the 16th inst. the new Wesleyan church at Ripponden was formally opened. It occupies a capital position on the hillside, in close proximity to the site of the old building. It is built of stone in the Late Gothic style, and consists of nave 59 feet long by 35 feet and transepts, 20 feet wide. The total width of the church across the transepts is 51 feet. At the end of the church nearest the entrance there is a gallery. At the rear of the church there are two vestries, with lavatories and an organ chamber. The ceiling and the pews are all of pitch pine. The church will accommodate 409 adults, or a mixed congregation of 540 persons. On account of the great slope of the ground, ample space was afforded for a lecture hall 51 feet long under the rear

of the church. Mr. John Mills, of Derby and London, w. architect, and the inclusive cost is expected to work about 3,000*l*.

NEARLY twelve months ago mention was made in notes, says the *Morning Post*, of the reputed corrosive of non-flammable wood on textile fabrics, and it was stated the Admiral-Superintendent at Portsmouth had ordered chests of drawers to be made—one of ordinary wood and other of non-flammable wood—and similar materials placed in each. These chests of drawers were placed in the Admiral Superintendent's office. It was originally intended the test should extend over three months. Eventually, however, the period was extended to a year, and as that time has now expired, and as the chests have been frequently opened during intervening months, and nothing has been heard of any detection of the material—a matter which would be sure to have leaked out—it may be pretty well assumed that no evidence incriminating non-flammable wood has been obtained from experiment. It has been contended by the advocates of material that the trials which have hitherto been given to the Royal Navy have been unintentionally unfair, and that regard to the alleged "sweating" and other defects, the yard authorities are at fault in not having treated the matter properly in the first instance. On this point no one outside a very limited circle can know anything.

### TRADE NOTES.

MACKAY'S patent direct-acting invisible roof ventilator supplied by Messrs. Cousland & Mackay, ventilator engineers, Glasgow and Manchester, have been used for ventilation of the New United Free Gaelic church, Paisley, Glasgow.

THE additions to the County School, Neath, are warmed and ventilated by means of Shorlands' patent Manchester grates, the same being supplied by Messrs. Shorland & Brother, of Manchester.

MESSRS. FOSTER & TIDNAM, timber, slate and general merchants, of Wisbech, announce that the partnership hitherto existing between them has been dissolved by mutual agreement, and that the business will henceforth be carried on in the style of Foster & Sons.

alterations in connection with the churchyard at the e, which is situated next to the Bible Society in Queen oria Street, have now been completed. In place of the and ugly blank wall, new wrought-iron railings and stone with carved vases have been erected. The wrought-iron s are given by Mrs. Banister Fletcher, in memory of her husband, who was churchwarden. The churchyard has laid out in terraces and covered with turf, exposing one e best samples of Wren's churches to public view, and ng another green spot to London's dingy exterior. The e work may be reckoned one of the public improvements e City of London. There is to be no opening ceremony. work has been designed and carried out under the super- idence of the architects, Messrs. Banister Fletcher & Sons. keys, if required, are to be obtained from Mr. Thomas J. ffen, 30 and 31 St. Andrew's Hill (adjoining), Queen oria Street, E.C.

**SMOKELESS CITIES.**

alluring picture of the city life of the future was n by Principal Lodge at a meeting of the Birmingham iversity Engineer Society, says the *Birmingham Daily*. Dr. Lodge is a reader of the signs of the times, and in of developments in the engineering world he makes an esting forecast of the lines upon which such developments e expected to take place in the future. He believes that as a fuel will largely take the place of coal, that hall thus get rid of the smoke nuisance in towns, that there will be many great improvements in locomo- mainly in the direction of motor-car traffic. Referring to the latter subject he spoke of the overhead electric m as "very well for the present," but thought that the e lay with one or other of the surface contact systems h had been or was about to be introduced. He would like e electric trams treated in some measure as railways, use their speed, if unrestricted by legislation, could easily e high as 30 miles an hour. In Canada electric cars were ed to run up to 15 miles an hour, but they went 10 miles the country, and then, said the Principal, to the amuse-

ment of his hearers, "you have to keep your hair on." It was possible to live 10 miles from a city out there, and yet get in to business in a little more than 10 minutes. In the crowded parts of a city like Birmingham it was necessary to put loco- motion underground, but that was not altogether desirable.

There should be, he thought, a differentiation of traffic according to the speed of the vehicles. Swift vehicles, horses or motor-cars should be required to take certain streets; slow-moving waggons, brewers' drays and the like, which now sauntered down the middle of the road, knowing not nor caring who might run into them, ought to be at least required to keep on their proper sides, and should be as far as possible excluded from the main thoroughfares. If electric trams ran along the side streets they would be as accessible as an underground railway, and could travel a good deal faster than they did at present. Dr. Lodge indulged in some jests at the expense of the moving platform suggestions. They might have a sort of circle railway, he said, with a slow train constantly running round it. True, it would be somewhat of a gymnastic feat to jump aboard, especially for old ladies, but this might be obviated to some extent by having the platform moving also, at a slower rate. It would be very nice to have a travelling sidewalk, so that one might take a tour of the shops standing still, or even sitting on a camp stool. Speaking seriously on the question of the motor car and motor waggon, he thought these had a great future before them, especially the motor waggon. This part of the country was admirably adapted for developing the industry. The motor waggon might well com- pete with the railways in the transport of goods, and it would serve to open up the country districts and redistribute popula- tion.

Great developments might well be made in the speed of railway travelling, especially if the railways were relieved to a great extent of goods traffic. The only thing which prevented very high speeds was the air resistance, and at the present time trains were built up as if air resistance was just the thing in which they most delighted. Nobody would think of building up a ship consisting of a string of square carriages, one tied loosely on to another. The first law of motion was that a body once started went on until it was stopped. What a locomotive was doing, with all its puffing and pretence, after it had started, was not propelling the train, but making eddies in the air—overcoming air resistance. If the train were made cigar-shaped, and the carriages connected up with flexible connections, it might be made to travel at

tremendous speed with a small expenditure of power. There was a great future in some countries for the utilisation of water power to generate electricity for the driving of trains or for other power purposes. Open carriages could then be put on, for there would be no smoke or dirt from the engines, and railway travelling, especially through grand scenery, would become a real pleasure.

Then the University Principal turned to the consideration of the great fuel question. Incomplete combustion and bad coal were, he said, responsible not only for the grime of railway travelling, but for the dirt and smoke of towns. He held that the heating of towns, and to some extent of furnaces also, could be done very much more conveniently and cleanly by means of gas. The present gas fire was not satisfactory. It often smelt, and was then an abomination. This was mainly because the price of gas was so high that nobody dared burn enough of it to get a good draught. As a matter of fact, a coal fire was a gas fire, except that it also consumed coal tar and asphalt, and sent their fumes up the chimney to poison the atmosphere. When we burnt coal on a fire we were simply making gas on the premises, and making it very badly. It would be much better to make it somewhere else, say at the pit's mouth, where coal was cheap—he was not sure that it should not be made down the pit itself, and then it would obviate the raising of coal, and to save the coal-tar and asphalt. Gas for fuel should be supplied in such large quantities that it could be sold cheaply. The great difficulty would be in the way of mains. Such a revolution in fuel would be a great boon in many ways. There would be no fires to lay and make up, no ashes to rake out and cart away, no coal-cellars would be needed, and the household would be saved all sorts of trouble. Best of all, there would be no smoke. He did not think we at all realised what city life would be if the air were only clear. Picture London without its fogs. They sometimes hung over that city for a week. He was almost tempted to wish they would last longer, for then the citizens would be forced to do something to remove the cause. At the present time the air was only fit to breathe in this country where there was nobody to breathe it. Where the great bulk of the population lived it was polluted with smoke. We were simply breathing bad air and expelling air which was a little better. He hardly dared to think what our lungs were like after inhaling smoke particles for a long course of years. He did not mean to say that, comparatively, Birmingham was very

bad. As a matter of fact, it was much better than many large towns. When we had completely adopted electric lighting and gas for fuel there would be a tremendous revolution in the conditions of life. The day might come when municipalities would pass by-laws prohibiting any such stuff as coal being brought within the city boundaries.

### GREAT CANALS OF THE WORLD.

"GREAT Canals of the World" is the title of a study prepared by the United States Treasury Bureau of Statistics for publication in the forthcoming volume of the "Monthly Summary of Commerce and Finance." It shows the commerce, cost, and dimensions of the great canals of the world, especially those connecting great bodies of water, and which may be properly termed ship canals.

Ship canals connecting great bodies of water and of sufficient dimensions to accommodate the great modern vessels plying upon such waters are of comparatively recent production and few in number. The one great example of works of this character which has been a sufficient length of time in existence and operation to supply satisfactory data as to cost, maintenance and operation and practical value to the commerce of the world is the Suez Canal, and for this the available statistics begin with the year 1870, while its new and enlarged dimensions only date from the year 1896. For the Sault Ste. Marie Canal, connecting Lake Superior with Lake Huron, statistics date from 1855, though for the canal in its present form they cover only about four years. Statistics of the Welland Canal date from 1867, but for the canal in its present enlarged form cover only two years of operation. The other great ship canals of the world are of much more recent construction, and data regarding their operation therefore cover a comparatively brief term, and in some cases are scarcely at present available in detail.

The artificial waterways which may properly be termed ship canals are nine in number, viz:—

1. The Suez Canal, begun in 1859 and completed in 1869.
2. The Cronstadt and St. Petersburg Canal, begun in 1824 and completed in 1890.

The Corinth Canal, begun in 1884 and completed in

The Manchester Ship Canal, completed in 1894.

The Kaiser Wilhelm Canal, connecting the Baltic and the North Sea, completed in 1895.

The Elbe and Trave Canal, connecting North Sea and the Baltic, opened in 1900.

The Welland Canal, connecting Lake Erie with Lake Ontario.

and 9. The two canals, United States and Canadian respectively, connecting Lake Superior with Lake Huron.

The description which is given of each of these great waterways shows that the length of the Suez Canal is about 163 miles, the cost 100,000,000 dols., the present depth 31 feet, and at bottom 108 feet and at the surface 420 feet, and that the number of vessels passing through it has grown from 486 in 1870 to 1,494 in 1873, 2,026 in 1880, 3,389 in 1890, and 3,441 in 1900. The tolls charged are about 2 dols per net registered ton.

The Cronstadt and St. Petersburg Canal, which gives a new gateway for great vessels to St. Petersburg, is 16 miles long, including the deepening of the bay channel, 20½ feet in depth, and the total cost estimated at 10,000,000 dols.

The Corinth Canal, which connects the Gulf of Corinth with the Gulf of Ægina, is 4 miles in length, 26½ feet in depth, 25 feet wide at the bottom, cost about 5,000,000 dols., and reduces the sailing distance about 175 miles. The average tolls charged are 18 cents a ton and 20 cents a passenger.

The Manchester Ship Canal, which connects Manchester, England, with the Mersey River and Liverpool, was opened in 1894.

Its length is 35½ miles, depth 26 feet, width at bottom 100 feet and at the surface 175 feet, and cost 75,000,000 dols. Commerce on the canal shows a growth from 79,204 tons in 1895 to 1,492,320 tons in 1900.

The Kaiser Wilhelm Canal, which connects the Baltic and the North Seas through Germany, is 61 miles in length, 29½ feet in depth, 72 feet wide at the bottom, 190 feet wide at the surface, and cost about 40,000,000 dols. The number of vessels passing through it has increased from 19,960 in 1897 to 25,000 in 1900, of which number 16,766 were sailing vessels.

Tonnage in 1897 was 1,848,458, and in 1900, 4,282,094 tons. An additional canal, connecting the same bodies of water by the Elbe and Trave rivers, was opened in 1900. Its length is 41 miles, depth about 10 feet, width 72 feet, and cost 10,000,000 dols.

The great North Holland Canal, which connects Amsterdam with the sea, cut in 1845, but deepened at a later date, has now a depth of 20 feet and a width of 125 feet at the surface. The Caledonian Canal, which connects the Atlantic and North Sea through the North of Scotland, is 17 feet in depth, 50 feet in width at the bottom, 60 miles long, cost 7,000,000 dols., and is at its highest point 94 feet above sea level. The Canal du Midi, cut through France from Toulouse on the Garonne to Cette on the Mediterranean, a distance of 150 miles, is 6½ feet deep, 60 feet wide, and 600 feet above sea level at its highest point, and has 114 locks—total cost, 3,500,000 dols.

In America the canals connecting the Great Lakes are the principal ship canals, and are three in number—the Welland Canal, originally constructed in 1833, and enlarged in 1871 and 1900; the Sault Ste. Marie, or St. Mary's River Canal, opened in 1855 and enlarged in 1897; and the Canadian Canal at St. Mary's River, opened in 1895. The American and Canadian Canals at St. Mary's Falls are practically identical in location and dimensions, and are used interchangeably by vessels engaged in commerce, as convenience may dictate. The depth of the canals at the St. Mary's River is sufficient to accommodate vessels drawing 20 feet of water. The American Canal was originally constructed by the State of Michigan, but subsequently was taken charge of by the United States and enlarged at a cost of 2,150,000 dols. The cost of the Welland Canal was about 30,000,000 dols., largely due to the fact that twenty-five locks are required in surmounting the rise of 327 feet in the distance of twenty-seven miles. The number of vessels passing through the canals at St. Mary's River has greatly increased during the last few years, while the number passing through the Welland Canal has materially decreased, the number passing through the St. Mary's Canals being—in 1873, 2,517, and in 1901, 20,041, of which 15,837 passed through the United States Canal and 4,204 through the Canadian. The number of vessels passing through the Welland Canal has decreased from 6,425 in 1873 to 2,202 in 1899. The marked contrast between the business of the St. Mary's Falls and Welland Canals is largely due to the fact that the freights originating in the Lake Superior district are chiefly discharged at Lake Erie ports, and those destined for the Lake Superior region are chiefly produced in the section contiguous to Lake Erie, the Lake Superior freights being chiefly iron, copper and grain, and the Lake Erie freights for Lake Superior coal and manufactures. The business of the St. Mary's Falls Canals by far surpasses in volume that of any other canal of the world,

the freight tonnage of the American and Canadian canals combined being in 1901 24,626,976 registered tons, while the net tonnage of the Suez Canal in 1900 was 9,378,152 tons, and that of the Kaiser Wilhelm Canal 4,282,094 tons.

### THE BIRMINGHAM SEWAGE FARM.

BIRMINGHAM possesses no Thames, no Mersey, no Ship Canal. It has acquired, however, a pretty considerable strip of the Tame valley, and there, says a correspondent of the *Birmingham Daily Post*, the whole of its sewage is very thoroughly dealt with. In this great scheme the city does not stand entirely alone. She is the predominant partner in what made be referred to as the Tame and Rea Drainage District Company, Unlimited, the junior partners in which are Aston Manor, Smethwick, Handsworth, King's Norton, Erdington, Sutton Coldfield, and a collection of villages such as Castle Bromwich, Water Orton and Perry Barr. Included in this district is a population of about 825,000, Birmingham itself supplying 550,000.

The magnitude of the scheme is what most impresses a casual visitor. Mile after mile the farm stretches away from Saltley to Forge Mills, a full seven miles in all. The width of that part of the valley belonging to the Board varies from half a mile to a mile and a half. There, on 2,824 acres of land, the drainage from near upon a hundred square miles of country is purified and disposed of. The normal dry weather flow of sewage into the Saltley works is no less than 25,000,000 gallons. If it could be diverted into such a reservoir as the extensive and familiar one at Shustroke, it would fill it to overflowing in about eight days. But when the heavy rain-storms sweep over this 90 square miles of drainage area, and every drain and sewer is filled with the madly-rushing torrent, then the outfall at Saltley may be increased to as much as 200,000,000 gallons in a day. Remembering that the farm is 2,824 acres in extent, and that the sewage after preliminary treatment has to be distributed over this wide area, it may be imagined that a good many miles of channels and pipes are required. Most people will, however, be surprised to learn that if all these distributing sewers and conduits, with the drainage pipes and effluent channels, could be placed end to end, they would extend from Birmingham to John o' Groat's. Communication with every part of the farm is

secured by means of a very complete system of roads traverse every yard of which one would have to cover—as the works now in progress are completed—a distance great as that from Birmingham to Warwick, for the roadways on the farm have an aggregate length of twenty-two miles. The scheme being of such magnitude may readily be imagined that an enormous expenditure has been expended on purchasing and laying out the land, equipping the works. This is, of course, quite apart from maintenance expenditure, which amounts annually to 88,000*l.* gross.

The bacteriological treatment of sewage has been so discussed of late that the fact that all treatment of sewage except precipitation, is really bacteriological, has been lost sight of. The system adopted at Tyburn is what is really known as the broad irrigation, yet the ubiquitous bacteriologist plays so important a part that he is practically the only guiding agent, all the engineering and agricultural schemes are carried out being arranged simply in order to give the bacteriologist room and opportunity to do his work. The first process through which the raw sewage goes on arriving at the Saltley works at Saltley is the purely mechanical one of precipitation. So many of the streets and roads in the drainage area are macadamised that tons of road dirt find their way into the sewers, and are carried down to Saltley. Solid matter of this kind is extracted by passing the sewage so slowly through enormous tanks as to allow the particles to settle upon concrete flooring. When the liquid has passed away the deposit dries, and being almost identical in composition with the earth, it can be used for making up roads or similar purposes. Sludge of a less solid nature is collected in the second and third chambers of the tank, and is carried away by means of the long troughs on to land in the vicinity and dug in. Gravitation having played its part, the bacteriologist takes the field. From the sedimentation tank the liquid is run off into what are known as septic tanks. Micro-organisms, inconceivably small and numerous, live in the little lives in the foul depths of these tanks. If you took a handful of the liquid you would probably be holding a few millions of them. They attack all the living organic matter contained, and so break it up that the bulk becomes even more liquid than when it entered the tanks. That chemical changes of a more or less violent character are there taking place

enced by the continual seething of the mass, and by the that gas is given off in such quantities that under favourable conditions it can be set alight. The inorganic solids are en to the top, where they form a semi-solid crust, upon ch grass and other herbage grows. Many a dog has taken these treacherous surfaces for solid pastures, and has the penalty by dropping through the thin crust, while it is that two or three workmen, whom liquor had made un- ceptive, recently tried a short cut across, with exceedingly easant consequences.

The anaerobic variety of bacillus having done its work in airless, lightless depths of the tank, the liquid is drawn off the distributing mains which carry it to the furthest limits he farm, and flow it out on to the land. It sinks into the only to be attacked by another type of bacteria, the aerobic, ch finishes the purifying work of decomposition, and cons the matter into such elemental fertilising soil constituents can assist in the support of vegetable life, ready to go ough that wonderful cycle of transformations which may nately bring it once more to the outfall works. Thus ave a chapter in the strange story of how nature motes and supports life, and keeps the balance even. what is known as the bacteriological process of sewage osal exactly the same thing happens, but in large ks instead of over a wide area of land. A superficial a of one acre of tanks will do the same work as nty-five acres of land; and looking to a time when the dily increasing requirements will have absorbed all the d available, Mr. Watson is already preparing for the laying n of tanks on the bacteriological plan. When the works resent in hand have been completed the whole of the land he farm which can be utilised will be taken up, but there d be no present alarm on that score. Curiously enough in soil does not carry out the work of purifying so well as hich has been charged with dilute sewage for some time, a long period elapses before the ground becomes so erated that the chemist who analyses the drained-off ent cries, "Hold! enough." It was formerly the practice alley to treat the sewage with immense quantities of lime. s undoubtedly assisted the preliminary process of precipita- g, but the present engineer maintained that it also killed off eat proportion of the hard-working micro-organisms. The e treatment has therefore been abandoned and an annual ng of 3,000l effected.

From the extensive area which the drainage Board has

under their control, it may be gathered that they are farmers upon a pretty extensive scale. The 2,824 acres is split up for this purpose into three farms, each under the care of a bailiff. Agricultural results being only of secondary importance, however, farming is carried on under some difficulties. The anxious bailiff, jealously watching a promising crop, may any morning receive an unwelcome intimation that, owing to a heavy fall of rain over the drainage area resulting in an abnormal flow of sewage, his land must be flooded, and his crop, perhaps, all but ruined. The land, though exceptionally prolific in some directions—as many as six and seven crops of grass are often harvested in a year—is entirely unsuited for cereals, potatoes and some other products. Root crops, cabbages and rye grass, however, flourish in the moisture-charged ground, a good deal of stock is kept to consume the surplus food stuffs, and from the sale of stock and produce the Board last year derived a revenue of no less than 23,000l. The effluent drawn off the land by an elaborate system of drainage is discharged into the river Tame, through which it flows into the Trent, and ultimately finds its way to the sea. The Tame being so insignificant, it is very largely augmented in this way. Its volume is, in fact, practically doubled. At short intervals, along all the effluent channels, openings are arranged, so that a sample of the water can be secured for analysis by the chemist who resides upon the farm. From the analysis frequently taken the engineer is made acquainted with the condition of every field as a purifying agent, and he varies the method and extent of irrigation to suit the object in view—that of securing an absolutely non-putrification effluent. This, we understand, is invariably obtained. There are directions in which science may be further applied on the farm in the near future, for the introduction of machinery to force the sludge to the limits of the farm by compressed air is projected, with also an installation of electric power for driving the pumps required at various points, which is now done by means of portable steam-engines.

#### GLASGOW MUNICIPAL BUILDINGS.

SINCE the palatial City Chambers in George Square were built in 1888 by the Corporation of Glasgow at a cost of half a million the inhabitants of "the Second City," says the *Dundee Advertiser*, have always mentioned their "Marble Halls" with pride. It was another case, however, of pride going before a

fall. It was recently brought to light that decay had set in very extensively in the stonework, and although questions were asked in the Town Council the answers were indefinite. The latest disclosures have shown a serious state of matters. When the original specifications were issued for the contract it was agreed that the stone should be taken from either of two quarries supposed to be the best in Scotland. They were, however, new quarries, and to some extent it may be said that the stone was experimented with, a fact at which some of the citizens are now inclined to grumble when it is too late. The precaution, however, was taken to impose the condition that the stone before being used should lie for one year in the builder's yard for the very purpose of insuring the building against decay. It seems to have stood that test, but the sad fact remains that decay has set in faster than in any other building in Glasgow. Various advisers were consulted when this was ascertained, and, acting on the recommendation of one of the most experienced masons in the city, it was resolved to cut out the decayed portions and apply silicate solution for purposes of preservation. It was at one time intended to cut out a number of capitals altogether, and even now no proper estimate of the cost can be got. Some idea of it, however, may be formed from the fact that about 7000<sup>l</sup>. has been spent already on one side of the building, and that at the back, facing John Street. The most alarming feature of the misfortune is that the elaborate carving is very seriously affected, and what that means nobody seems as yet to know.

### BERMONDSEY ELECTRICITY WORKS.

THE new electric lighting and dust destructor works which have lately been brought to completion by the Bermondsey Borough Council are situated in Spa Road, at the rear of the town hall and public baths, and they occupy an area of about 1½ acres. The buildings consist of a destructor-house, an engine-room containing the generating plant, a pump and fan-room, an accumulator-room and offices. The destructor-house is specially designed with the view of giving adequate ventilation. It consists of six cells, each having 26 square feet grate area, and capable of destroying 50 tons of refuse in 24 hours. The refuse to be destroyed is brought in by the collecting vans, conveyed along an inclined roadway to a tipping floor at the back of the destructors, and discharged into spacious bins placed over the tops of the cells, from which the latter are fed

as required through rectangular shoots. After passing through the shoots the refuse is deposited on a hearth at the back of the furnace, and is there thoroughly dried before the refuse burning takes place. By these means the refuse is rendered more combustible and the vapours which are given off become innocuous by being passed over the hottest part of the furnace. The gases from the cells pass out at the front and are brought into contact with the boiler tubes, and are thus utilized for the purpose of raising steam. Each cell and its furnace is fitted with forced-draught apparatus. In deciding the system of distribution most applicable to Bermondsey the engineers had under consideration the fact that the district is very concentrated and is filled with factories and workshops, and that the most favourable opportunity occurred for supplying electricity during the daytime for motive-power purposes. The alternate current system was therefore, not deemed so suitable as the continuous current system which has been adopted. The plant at present installed in the generating station consists of three multipolar generators, constructed by the Thames Ironworks Company, coupled to two engines, two of which are three-crank engines. Two sets of generators have an output of 150 kilowatts at 480 to 520 volts, and the other set an output of 75 kilowatts at 480 to 520 volts. There is also installed in the station a balancer and a battery charging motor booster. The battery, which consists of 280 cells, is capable of giving a discharge of 83 amperes at 510 volts for 10 hours, or on an emergency 300 amperes for one hour. The switchboard is an interesting construction, and is mounted on a wrought-iron frame. It consists of panels of polished brass enamelled slate. The board has been designed to control three dynamos, six feeder circuits, eight arc circuits, the hall, the depot and station lighting and power circuits, storage battery, the balancer and the battery charging motor booster. In the borough the three-wire system of mains has been adopted, and the feeder mains are at present four in number. With regard to the public lighting there are at present seventy-one standards erected, supporting ten arc lamps and the incandescent lamps. At two o'clock every night the arc lamps are permanently turned on, and the incandescent lamps lighted. The new stables, which will afford accommodation for sixty horses, are at present only fifty-four stalls are fitted up. The new depot includes workshops, stores, offices and other buildings for municipal purposes.

At the opening ceremony Mr. T. Cox (chairman of

electric-lighting committee) stated that the charge for electric lighting would be 6d. for the first hour and 3d. for each hour afterwards, based on the minimum demand system. For five-power purposes the charge would be 2½d. per unit. He remarked that the question of the disposal of the residuum from a destructor had occupied the attention of the Council, and an electrically-driven hydraulic plant for the manufacture of bricks from a portion of the clinker had been laid down. That machine would turn out flags at the rate of 25 per hour at a very low cost. The clinker was ground very fine, mixed with a proportion of cement, thoroughly incorporated and then subjected to a pressure of 1,000 lbs. per square inch, and afterwards allowed to dry.

### LEEDS BUILDERS' EXCHANGE.

Members of the Leeds and County Builders' Exchange held their annual dinner at the Hôtel Métropole, Leeds, on Monday night. There was a company of about seventy, and the chair was occupied by the president of the club, Mr. E. M. Peleby. After the loyal toasts, Mr. Paul Rhodes gave "The Lord Mayor and City Council," and referred to the many improvements in the city that had taken place within the past few years. The money thus expended, he said, had not been misspent, but would repay them in the spending. There were one or two eyesores that he wished to be removed. First and foremost there was an ugly corner extending from the Queen's Hotel to Aire Street. When was this to be done away with, and when was the Midland Company going to put up a station entrance here in the city? There was another ugly corner opposite which wanted dealing with speedily. Lastly, there was the neglected dismal pile of buildings opposite one of the grandest halls in the kingdom. If the gentlemen who owned this property had anything like an eye for beauty rather than for a few pence, it ought to be all pulled down and enable us to have a square there fit for the fifth city of the country.

Alderman Carter responded. Mr. Wood Higgins gave "The Building Committee and Officials" of the Leeds Corporation, and, in passing, remarked that work had been given to outside architects, as he was of opinion that there were men in the city who were capable of carrying out any work entrusted to them.

Mr. E. W. Batley, who responded to the toast, said that Leeds as a city was second to none in the position it occupied with regard to its sanitary arrangements and its buildings right in the way through, speculative or not. In his opinion, the speculative builder in Leeds had done good, honest work. Mr. Batley also paid a tribute to the capabilities of Leeds architects, who, he said, were as expert as any outside the city.

A word in favour of the Leeds back-to-back houses was put in by Mr. Batley, who said they were, on the whole, more comfortable and convenient for the working man and his family than the through house. The air space of these back-to-back houses was generally good, and the streets were reasonably wide.

As regarded the Midland Railway station, the Leeds Corporation had determined to do away with the objectionable goit in that district, and thus altogether improve the station and its surroundings. Under these circumstances, it would be only fair for the railway company to improve their station entrance, to say nothing of contributing a sum of money to the Corporation for the improvements effected.

Mr. Towers also responded. The toast of "The Leeds and County Builders' Exchange" was proposed by Mr. W. Bower, who observed that, so far as their Exchange was concerned, they had no jerry builders.

The toast of "The Visitors" followed.

### NEW MUNICIPAL OFFICES, CALCUTTA.

A PERUSAL of the proceedings of the special committee appointed by the Commissioners to consider the tenders received for the above new buildings is, says *Indian Engineering*, interesting in several respects. The members were Mr. Greer, the chairman, Messrs. M. C. Turner, T. R. Wynne and W. J. Bradshaw and Rai Bahadur K. N. Chatterjee, and the tenders to be reported upon were those submitted by Messrs. Mackintosh Burn & Co., Messrs. Martin & Co., Messrs. Burn & Co., and Messrs. Sarat Kumar Roy & Co. The last-named firm submitted the lowest tender, which the Rai Bahadur member recommended should be accepted, but the remaining gentlemen were not to be persuaded to make a leap in the dark, and unhesitatingly objected to entrusting a building of architectural pretensions that should be carried out with every care and artistic accuracy to a firm whose qualifica-

tions for an important work were that they had built a large mill or two.

There was obviously a difficulty on the very face of the question, for the engineering department of the municipality had declared their inability to satisfactorily supervise the construction whether done on a wholesale contract or by piece-work. It was felt also that the control of an architect was essential to the proper execution of a work of this stamp—and very rightly so—and between this sense of inability and the status created by the contrariness of the tenders, the more thoughtful and far-seeing members of the committee realised the existence of an impassable quagmire which it was imperative should be avoided at all hazards. It is no wonder, then, that Mr. Wynne clinched the situation by the following remarks:—"Why not ask whether the Bengal Government will not undertake to carry out the work under Mr. Banks Gwyther's supervision? You have got a very good case. There is no architect in the Corporation, and this is a building which requires the services of an architect. It is a complicated building, and requires very careful construction. The Corporation must obtain an architect, but they really do not know where to look for one. Mr. Banks Gwyther has designed this building, and it will be most satisfactory if he will carry it through. These points may be pointed out to the Bengal Government, and they may be asked to carry out the construction of this building under the superintendence of Mr. Banks Gwyther." This solution of the difficulty commended itself to the committee, who unanimously accepted the proposal that the Government should be approached as suggested by Mr. Wynne.

There is something in this turn of things that must commend itself generally. But although this is so, we cannot but condemn the policy adopted in regard to obtaining tenders, and the sequel to it as it affects the contractors who tendered. The principle of lump sum tenders was wrong, and under proper advice the mistake of inviting offers on this system would have been obviated. Now, as things are shaping themselves, the four firms named have a distinct grievance, and it would be a graceful act on the part of the Commissioners, if all the tenders are to be rejected, to recoup them for their trouble in taking out quantities preparatory to tendering.

The present position, we understand, is that Government has been addressed in accordance with the resolution of the special committee, and that it now remains for the Lieutenant-Governor to decide whether he will accede to the request of the

Commissioners or not. We expect to hear that Sir Woodburn has agreed to entertain the proposal and to let the construction over to the Public Works Department contribution work.

### FOREIGN COMPETITION.

THE forty-fifth anniversary dinner of the Manchester Association of Engineers was held on the 25th inst., under the presidency of Mr. E. G. Constantine. There was an exceptionally large gathering. The guests included the Lord Mayor of Manchester (Mr. Alderman Hoy) and Mr. Stewart, a representative of the British Westinghouse and Electric Manufacturing Company, Ltd. After the dinner the usual toasts were submitted. The toast of "The King" was proposed by the President.

Mr. Joseph Nasmith, in proposing success to the Association and to the engineering and allied trades, said he was going to show they were not in that parlous condition which many people, and more especially the daily press, would have them believe. They heard a great deal about the German invasion. Well, there was kinship between British, Germans and Americans, and Great Britain need be surprised that from Germany and the United States there should come the most strenuous competition. On that point he had to say for this country, old as it was, and maligned as it was, they were not afraid of any competition. There had been a great deal of talk lately about the American invasion. Well, if eighty millions of people, of the same race and with the same virility, could not produce better results than thirty-five millions, they ought to be ashamed of themselves. At the same time, there was no reason why the old stock should be afraid of what the new stock could do, and he tested against the national habit of self-depreciation which tolled our competitors and to some extent debased themselves this habit of depreciating ourselves and of telling other nations that we were behind in the race did not cease other people would come to believe us, and then there was an end to prosperity. There was no truth in the statement that England could not do things as well as the Germans or the Americans. As regarded engineering work, Englishmen could do quite as well as anybody else; in fact, they ought to do better, because one of the chief features of the American workers was that they went in for quantity and speed rather than quality. T

ing so, he submitted the time had come when Englishmen could cry their merits as loudly as they had hitherto promoted their demerits.

The President, in his response, endorsed the views expressed by Mr. Nasmith as to there being no cause for fear that England would not be able to hold her own in the commercial war.

The health of the guests was proposed by Mr. T. Ashbury, and responded to by Mr. Stewart, of the British Westinghouse Company. Mr. Stewart said that of the materials used in the construction of the works in Trafford Park 80 per cent. came from the United States, and the remaining 20 per cent. was got from England. Why? Because the goods could be imported for 10 per cent. less than they could have been purchased at in Great Britain. How this was he did not know. That was a question which his hearers were probably better fitted to answer than he was. In regard to English methods of work, Mr. Stewart said he thought English manufacturers made things to last too long. In America they made things to last 10 years, because experience had taught them that there was a revolution in manufacturing forms every decade. As for the future he represented, he had to say they had come over here to see one of the many. "We want to be one with you."

### ELECTRIC LIGHTING IN LEITH.

THE addition of a new large engine and dynamo to the Leith electric-lighting station, by which the power of the installation increased 50 per cent., was made the occasion of a public ceremony, which was performed by Mrs. Mackie, wife of the Provost of the burgh, on the 23rd inst. There was a full attendance of the members of the Council and their lady friends, and when the new engine was started by Mrs. Mackie, at the request of Bailie Craig, the convener of the electric-lighting committee, and under the direction of the engineer, Mr. J. Gray Scott, loud and enthusiastic cheers were raised. A few minutes later a very pretty effect was produced by the lighting of a number of lamps, artistically arranged round the new machinery. The company afterwards adjourned to the station, which adjoins the electrical department in Great Victoria Street, where tea was served under the chairmanship of Provost Mackie.

Bailie Craig, in presenting a piece of silver plate to Mrs. Mackie, explained that the new 500 horse-power engine and

dynamo which had been inaugurated that day represented the latest addition to the plant of the station, and it presented special features of a novel character as compared with the original plant. The engine exceeded in size anything they had had before, and it was of the triple expansion type. That was to say, the steam was used successively through three cylinders in place of the old method, where it was used through one cylinder, and then dissipated in the open air. That was a great economy on the power of the engine, and by special by-passes the engine could be made to work at 25 per cent., an expedient which would be found of great value for coping with the heavy load which came on at certain hours in all stations. The installation of an engine of that size proved very clearly the rapid strides they had made since the inception of the undertaking by his friend Bailie Manclark. The street lighting was first switched on on December 23, 1898, and shortly afterwards the public supply was commenced. The original plant consisted of five small engines on the north side of the engine-room of altogether 700 horse-power. It was soon found necessary to make additions to the plant, and a set of 300 horse-power was installed over a year ago, whilst the latest addition, inaugurated that day, had been installed to meet the further increasing demands for light and motive power, so that they had in their station now no less than 1,500 horse-power to generate their electricity. At the commencement of the station the consumers numbered about 80. To-day there were close upon 400. The number of public arc lamps originally was 74. The number to-day was 223. The units generated in the first year were under a quarter of a million. In the second year these increased to half a million, and during the year just ended the output had been three-quarters of a million units. The lamps connected at the outset numbered 15,000. In the second year these increased to 26,000, and at the present time they had connected a total of 35,117 lamps in eight candle-power equivalent. The revenue in the first year amounted to 3,059*l.*, in the second year to 5,839*l.*, and in the year just ended to 9,000*l.*; while in order to popularise the use of electricity for all purposes, the price, which at the outset was 6*d.* per unit for lighting, and 3*d.* per unit for motive power, had been reduced to 5*d.* and 1½*d.*, and at May 15 last these prices were still further reduced to 4*d.* and 1½*d.* respectively, and it was to be hoped this endeavour on the part of the Council to increase the consumers would meet with success. Bailie Craig then handed to Mrs. Mackie the gift which had been subscribed by the members of the Council as a tangible

### A SPLENDID RECORD.

#### Two Great Newspapers.

Recently the owner of a foundry saved by the May-Oatway Fire Alarm wrote:—"It is the best," and now the *New Zealand Star*, referring to a big gas explosion in its own premises, says:—"A satisfactory feature is the test it gave to the efficiency of the May-Oatway Fire Alarm apparatus. Though only a little heat was generated the apparatus promptly signalled the alarm, and the fire brigade arrived." The *Otago Daily Times*, whose premises are also protected by this system, in referring to the *Star* explosion, says:—"It would thus appear that the May-Oatway Alarm is as efficacious in the case of an explosion as it has already proved itself to be on an outbreak of fire." This confirmation of its high reputation gave great satisfaction to the Brigade and Insurance authorities, the two great organisations of which have unanimously recommended this system.

proof of their regard and the honour she had done them in performing the service of starting the new engine and dynamo.

Provost Mackie cordially returned thanks on behalf of his wife. He took occasion to add that a few weeks ago, when passing up Leith Walk with Councillor Hislop, they found the cable cars dotted all over the place, in consequence of a breakdown, and the electric lamps in the centre seemed to say to them, "Why don't you give us a chance? We would not leave you in that lurch. We would have a constant service for you." There was no doubt the traction for tramways was electricity; and he hoped and trusted before the century was long past the Leith Corporation would acquire the tramways in the burgh, and when they did so they would certainly adopt electric traction.

A few remarks were also made by ex-Bailie Manclark, the former convener of the electric-lighting committee, who expressed his pleasure at seeing the returns going up by leaps and bounds; and by Bailie Kinnaird, on whose proposal a vote of thanks was accorded the Provost. The proceedings terminated with the singing of the National Anthem.

The new engine and dynamo have been supplied by the India Rubber, Gutta Percha and Telegraph Works Company, Ltd., Silvertown, London.

### BRACEBRIDGE ASYLUM.

COLONEL A. G. DURNFORD, R.E., Local Government Board inspector, held an inquiry on the 21st inst. into the application by the Lindsey County Council, the Holland County Council, the Grimsby Town Council and the Lincoln City Council for sanction to borrow 33,974*l.*, 17,000*l.*, 10,379*l.* and 9,532*l.* respectively for the purpose of enlarging Bracebridge Asylum. Mr. C. Scorer represented the Lindsey County Council; Mr. T. C. Johnson, Holland; Mr. J. T. Tweed, Lincoln; and Mr. J. Broadhead, Alderman Wright and Councillor Pickwell, Grimsby.

Mr. W. T. Page, clerk to the Asylum Visitors, stated the construction of the present asylum commenced in 1847, and the building was opened in 1852, the accommodation then provided being for 266 patients. Altogether about 44 acres of land were purchased, and the total cost was about 53,000*l.* In 1858 the asylum was enlarged to accommodate 410 patients, in 1865 to provide for 570 and in 1880 it was further enlarged to accommodate 680. That was the extent of the accommodation for

which the existing buildings made provision, but on January the number of inmates in the asylum was 742—357 males and 385 females—and in addition twenty-five patients were boarded out at Newcastle-on-Tyne Asylum and twenty-five at Leicester Borough Asylum. For many years the number of inmates had been slowly, steadily and persistently growing, and it was needless to say the Commissioners in Lunacy had been slow to remind the authorities of the duty incumbent upon them to provide greater accommodation. Until recently the county of Kesteven and the borough of Grantham were partners in the asylum, and when in 1895 those two authorities agreed to provide asylum accommodation themselves it was some hope that the withdrawal of their patients would render further enlargement of the asylum not so imperative as would otherwise be the case. The increase in the number of patients, however, rendered enlargement necessary, and the initial step—the Commissioners, having regard to the number of patients, requiring an additional area of land—the visitors cast about to obtain the necessary acreage in proximity to the asylum. For many years they had been in the occupation of 100 acres of arable land immediately to the east of the asylum proper, and they had now entered into a contract with Mr. Sibthorp (the owner) to buy 60 acres at 1*l.* per acre. Then, desiring to avail themselves of the expert opinion, they obtained the services of Mr. Gough, and he had prepared the plans which were now before the Commissioners. The plans had been very carefully considered by special committees of the visitors, and by the visitors themselves, who did not give their instructions to Mr. Gough without very much thought on their part as to the nature of their requirements. It would be seen from them that it was proposed to add a large block in the centre of the northern side of the asylum, and by throwing out extensive wings on the extreme eastern and western sides, accommodation would be provided for 1,000 persons, including those attendants who occupied apartments in the asylum. The Lunacy Commissioners occupied several months in considering them, and had paid Mr. Gough and the visitors the high compliment of returning them, contrary to their usual practice, without a scintilla of adverse criticism. The formal sanction, too, had been received of the Secretary of State. As to the payments by the various authorities, the portions were worked out according to the terms of agreement and had been approved of by the Councils concerned.

Mr. Gough gave evidence as to the proposed additions, and the inquiry, which was entirely formal, then closed.

# ARMOURED FIRE DOORS

Officially Endorsed by the Fire Offices Committee.

Lighter and Cheaper than Iron Doors.

Can be made to Close Automatically in Case of Fire.

Will NOT Buckle or Twist out of Shape.

## STEAM HEATING INSTALLATIONS, HIGH AND LOW PRESSURE. VACUUM SYSTEM.

Water Softening and Purification,

Feed Water Filters.

**MATHER & PLATT, L<sup>TD</sup>.** (into which is merged DOWSON, TAYLOR & CO.)  
Manchester; and 14 Victoria Street, London, S.W.

# The Architect.

## THE WEEK.

ter which has been just issued by the Home reveals that already the shortcomings of the and Workshop Act of 1901 are perceived in 1. In sub-section 3 of clause III. it is enacted ere a workshop or workplace, not being a domestic , is occupied by day as a workshop and by night ping apartment, the Secretary of State may by der modify the proportion of cubic feet of space d in this section, and substitute therefor any ures, and thereupon this section shall have effect ed by the order." The Act had only been in for about a fortnight when it was realised that the ace was altogether inadequate. The Home has therefore made the following order:— a workshop other than a domestic work- occupied by day as a workshop and by a sleeping place, the proportion of cubic pace prescribed in sub-section (1) of the said all be modified by substituting 'four hundred' undred and fifty,' and accordingly such workshop the purposes of the law relating to public health, d to be so overcrowded as to be dangerous or to the health of the persons employed therein if er of cubic feet of space in any room bears to the f persons employed at one time in the room a less than 400 cubic feet to each person." This is sufficient to demonstrate that we were not ing when we said that the majority of factories o be taken down and rebuilt. No band of white- an increase cubic capacity from 250 feet to 400. r cases will follow in course of time, and the cannot be adapted to meet modern sanitary con- without heroic operations.

M. HENRI BOUCHOT, of the ue-Nationale, now declares that a part of a block resentation of a *Crucifixion* has been discovered ry town of France. The costumes are evidently d in the middle of the fourteenth century, and it d that the wood block belongs to some time 1340 and 1350.

w of liability for injuries to third parties arising ding operations is in a rather indefinite position. as any probability of injury the building owner ade liable. But much will depend, of course, extent and character of the knowledge. If, for n an adjoining house there is a beautiful marble ith which people living in the neighbourhood inted, if only by hearsay, then any building is about to have alterations or rebuilding of a one side should take special measures that no can arise, as from the crystalline character of the slight jar in the lower part may extend through its. But when a contract is let, and the circum- a not supposed to be exceptional, the contractor is ble. It is generally felt, however, that it is better to ance doubly sure by obtaining an indemnity from ctor. A case which was tried at Bedford on y shows how, from the indefiniteness of law on the building owner, as well as a contractor, can at will

be made responsible. The circumstances were as follows:— While the site for a Board school was being cleared the outer walls of a cottage fell on two women who were passing along the public way, and both sustained injuries. Action was taken against the School Board and the contractor. The Board claimed that they were free from liability, which devolved upon the builder. The builder stated that the accident arose through a violent gale, which could not have been anticipated. Mr. Justice GAINSFORD BRUCE left the following questions to the jury:— (1) Was the builder guilty of negligence in executing the work of pulling down the cottages, and was it owing to his negligence that the plaintiffs received their injury? (2) If so, what compensation was due to the plaintiffs separately? (3) Was the work of pulling down the cottages to be done by the contractor employed by the School Board, work from which injurious consequences might reasonably be expected to arise to the public, unless means were adopted by which such consequences might be prevented? (4) Did the defendants, the School Board, see that any special precautions were taken to protect the public passing along the highway? All were answered in the affirmative. It was also found that there were dangerous elements in the work, and the School Board had neglected to take proper precautions. Damages amounting to 300*l.* and 70*l.* were awarded, and it was directed that judgment should be entered for each plaintiff for the amounts as against both defendants.

THE town of Maynooth, or as it should be called Magh Nuadhaid, in county Kildare, is known far and wide by its college for the education of Roman Catholic priests. Most of the buildings were designed by PUGIN, who seemed to be desirous of suggesting the privations which were before the students. Maynooth is also famous in Ireland from being the site of "Carton," the residence of the Dukes of LEINSTER. The name in Irish was Baile-an-Cairthe, which meant "The Town of the Pillar stone," for the majority of the old Celtic names are more or less poetic. In course of time the name was changed to The Carthyn, and later on it became Cartown, as it was still called by the people until the latter end of the eighteenth century, when the present name was adopted. About the year 1739 Carton became the residence of the Earls of KILDARE, who at that period added to the house built in the seventeenth century by the TALBOT family, and made it much as it appears at the present time. At about the beginning of the seventeenth century Carton was the residence of the famous Duke of TYRCONNEL, who was the chief representative of JAMES II., and whose weaknesses are exposed by MACAULAY in his "History." The mansion, like many others of the eighteenth century, consists of a central part united with pavilions by a colonnade. The FITZGERALDS, who are represented by the Duke of LEINSTER, were among the followers of STRONGBOW who invaded and conquered Ireland in the twelfth century. They became so powerful, they were able in the sixteenth century to ignore the authority of England for a time, but their rebellion was suppressed and some of the chiefs were executed at Tyburn. The late Queen VICTORIA visited Maynooth in 1849, and it may be the scene of a royal visit during the present year.

READERS of the "Musketeers" cannot fail to remember the Rue Picpus in Paris, leading out of the Faubourg Saint-Antoine. It originally formed part of a property called Piquepusse, outside the boundaries of Paris. A tablet has been found on one of the houses which recalls the ancient apprehensions about the growth of the city, or, rather, of its suburbs. It is dated 1726, and it was fixed at a corner of the street. It announced that by command of LOUIS XV. building was prohibited beyond the house on which the tablet was placed. In the course of years the tablet was so affected by time as to become imperceptible, but it has been at last discerned by archæologists and brought under the notice of the Commission of Old Paris. The tablet will be cleaned and restored to its former position, for it is interesting not only as a landmark, but is a relic of the severity of former building regulations in Paris.

### "SLANE IN BREGIA," COUNTY MEATH.

IN the last number of the *Journal of the Royal Society of Antiquaries of Ireland* there is a paper on "Slane in Bregia," by Mr. T. J. WESTROPP, M.A., a gentleman who has served the Society with pen and pencil during several years. Slane is a name which for the English tourist in Ireland does not conjure up much, if any, historic or legendary interest. It may be taken as one among many hundreds of similar old-world sites that never can be considered as favoured by archaeological importance. But on that account it is not undeserving of notice. Skilled painters in modern times are ambitious to make pictures out of unpromising subjects, and a great many writers of books are under the sway of a like power. It is possible, therefore, for anyone who is a skilled archaeologist to utilise Slane as well as many other localities that have been long undervalued. Each of them can be made, as it were, a microcosm, and will enable us to have glimpses of the life of men during many centuries.

The tendency of much of the modern inquiry into the past is unfortunately affected by commercialism. Frenchmen and Germans, as well as Englishmen, are always on the look out for foreign fields of exploration. But the desire is to get hold of places which will yield spoils having a market value, or likely to be a commercial asset. There is no systematic plan adopted for revealing what Greece, or Egypt, or an Eastern country was at any time. The endeavour is, in short, to enrich a museum with objects which will be more esteemed than any to be found elsewhere. Commerce has no country, and if it could be assumed that in South America hoards of novelties were likely to be unearthed, those who undertake explorations would willingly abandon Europe, Asia and Africa in order to carry off the novelties which gain renown for collectors and possessors. There is no denying that in the course of the scramble much is sacrificed which in a later and a wiser time would be valued by archaeologists far beyond trinkets or the dust of cosmetics.

This love of what is foreign is nowhere advantageous to native archaeology. What the Russian writer, TURGUÉ-NEFF, well says is particularly applicable in such inquiries:—"The cosmopolitan is a nonentity—worse than a nonentity; without nationality is no art, nor truth, nor life, nor anything. You cannot even have an ideal face without individual expression; only a vulgar face can be without it." Now Ireland has suffered grievously through a modish cosmopolitanism. Gentlemen of property during more than a century sought a home anywhere rather than on their own estates. The social consequences we need not here trace, but there is no doubt that archaeology has been a loser through it. In the *Journal* there is an article on Inchiquin Castle, which, judging by the remains, must have been a fine building, but owing to the absence of the owner it was allowed to be used as a quarry. It is said that out of mischief one of the door-piers was smashed with a sledge-hammer, when the greater part of the tower collapsed. The explanation which the writer has to offer reveals to us that in Ireland absenteeism or cosmopolitanism was a greater evil than religious vandalism in other countries:—

It is rather difficult to understand, he says, how it came to pass that a family like that of the O'Briens of Inchiquin, rich and powerful down to the middle of the nineteenth century, when their line came to an end, could allow the ancient and beautiful home of their sires to run thus to rack and ruin without raising a finger to prevent it. To let it crumble into dust in natural decay by the cruel hand of time was reprehensible enough, but that they could stand by and see it made a common quarry by every lout who required a lintel for his pigsty, passeth all understanding. Such a thing could not have happened in any country under the sun where the native gentry retained true pride of race. Residence out of Ireland, together with continuous intermarriage with strangers, by which they became more English than the English themselves, hindered any thought of maintaining those memorials which threw the greatest lustre on the history of their race.

There are signs, although it is now almost too late, of the approach of a more appreciative spirit. The study given to the ancient Irish language and literature by German philologists and the admiration of a scholar like MATTHEW ARNOOLD have caused the Irish people to give some slight

attention to things which they and their forefathers did. Everywhere they have materials which repay investigation. The names given to divisions of land, to rivers and lakes, all evidence of the diffusion of a poetic spirit in the days. What is more, there is hardly a parish through the country which does not afford traces of life in conditions very different from the present, and the archaeologist, without travelling beyond his own county, can create vistas of the past which, if not historic in the same degree as the annals of a court, are still interesting.

Slane, as we have said, is just such a subject as may be classed as normal in an archaeological sense. It is a little town or village in the County Meath, about 15 miles from Dublin, but as remote from the life of the capital as if it were an islet in the Atlantic. The Boyne runs by it, and the battlefield on which was fought the fate of the STUARTS in England is not far off. The skirmishes with the outlying reserves took place on the south side of the river opposite Slane. Meath is a county, and around Slane the land is prized by tourists. On account of the character of the region, from its not being close to the coast, several settlements were established in Meath. In the poem ascribed to ALFRED, who was afterwards the great monarch, he is made to declare—

I found in Meath's fair principality  
Virtue, vigour and hospitality;  
Candour, joyfulness, bravery, purity,  
Ireland's bulwark and security.

Assuming ALFRED to have visited Meath in the ninth century, what would he have found at Slane? He would have seen a prehistoric fort or tumulus, the top of which was an irregular circle of nearly 300 feet in circumference. The sides were very steep, and at the foot was a ditch from 16 to 18 feet wide, excavated in rock, and there near the surface. There were other mounds of smaller size, and they were evidently used by the primitive race as positions from which the approach of enemies could be perceived, and as a final refuge in case of attack. There are various references in old Celtic tales to dark caves in Meath, and one is said to be at Slane. A concealed cavern was several years ago opened, but as the exploration went there was nothing remarkable in the cavity. It has been suggested that the mysterious New Grange was the one referred to. It is well known by reputation because of the abundance of ornaments which is found within it. Slane had a notoriety for its works, and there were legends about a terrible slave who had ditches excavated in order to bury the remains of whom he could find no other use. Slavery indeed is a very ancient institution in Ireland.

ALFRED, as a Christian, would of course, be interested to learn the association of Slane with St. PATRICK. One of the great events of the missionary's career was his visit to Teamor, or Tara, where the Irish kings, princes and nobles were accustomed to assemble. He may have visited Slane, for his earliest disciple lived there as a hermit. This was St. ERC, the site of whose hermitage has been pointed out, but the remains belong to a much later period. As mention is made of the following abbots of Slane about ALFRED's time, viz. COLMAN, son of the Briton, died 746; FEADACH, son of CORMAC, died 784; OILIOLL, son of CORMAC, died 797; CONGAL, son of MOENAGH, died 801; SUIBNE MACMONY, died 806. It may assume there was an abbey. ALFRED would be interested to learn the learning of the Irish monks, and no more likely to shelter them than Slane. An archaeological problem would have been solved if any other traveller of that time, had alluded to the tower. The Irish antiquaries of the eighteenth century insisted that they were of more ancient date than even St. PATRICK, but in the following century there was a reaction, and they were said to be of the thirteenth century. There is a belfry tower attached to the remains of the Franciscan priory, but it is not of early construction.

It is characteristic of Ireland that the existence of churches and ecclesiastical buildings can only be ascertained by records of attacks upon them which caused their destruction. In the tenth century

tain there was an abbey of Slane because it was undered. There are similar occurrences recorded in 1102, 1156, 1161, 1170. In 1176 there was another and a ferent sort of contest, one between races, when no person escaped alive from the castle. This, says Mr. WESTROPP, is a crushing blow to Slane, with which its importance and that of its abbey passed away, and its episcopate was merged with other small sees to form the diocese of Meath. The fury of the combatants in wrecking harmless works in Slane seems incredible; for we learn that the cross on the tower of Slane was cast up into the air, and its fragments dispersed to Taitlen, Tara and Fennor, a remarkable incident for days when explosives were unknown.

Crosses and buildings used to be set up as soon as possible by the philosophic survivors, but much was lost in the process. Only one small piece of Celtic interlaced ornament is now to be found at Slane, although similar carving may have been abundant. The Franciscan monastery, of which part remains, is not believed by Mr. WESTROPP to be older than 1512, although it may contain relics derived from an earlier building. In the sixteenth century there was no need to apprehend incursions by neighbouring tribes, but the monastery was doomed to be subject to the usual law of mutation which always prevailed at Slane. In 1540 the prior surrendered to the commissioners of HENRY VIII. a church, belfry, dormitory, garden and two closes containing 1 acre. They were given to JAMES FLEMMING. In 1620 the learned Archbishop HANMER said the rectory was worth 24*l.* 5*s.* 10*d.* According to him the church and chancel were in repair, and there was "a fair stone house or castle and some houses of the reasonably well repaired; a haggard and backside. Of recent times there belonged to the rectory a college and 10 acres or thereabouts and some twenty houses for the maintenance of four priests, four clerks and four choristers. The walls of the college are yet standing and adjoining to a parsonage house, all which of long time have been in possession of the Lord of SLANE, but it is not known by what right." In 1631 the monks returned, but they were expelled by the Cromwellians, and the church fell into a ruined state.

Another interesting block of buildings has been named St. Mary's College. It had a south frontage of 102 feet 6 inches, and "formerly displayed a row of four windows in the upper storey; each was divided into four by stone shafts and transoms, the lights having semicircular or very slightly pointed heads, like those in the south wall of the church." Another wing enough remains to show that each room had a fireplace, a recess, a window and garderobe, the last being in a projection.

From Mr. WESTROPP's description it will be evident that Slane deserves a visit from archaeologists. Hitherto it may be said to have been almost neglected. The information that has reached Mr. WESTROPP's labour is now forthcoming must be regret that numerous other places in Ireland have not received the like attention.

### HIGH BUILDING CONSTRUCTION.\*

THE renowned Herr TEUFELSDRÖCKH had his speculum, or watch-tower, on the attic floor of the highest building in the Wahngasse of Weissnichtwo. From it he could look down on the wasp nest or beehive below; or, as he sometimes said, the Egyptian pitcher of tame vipers, struggling to get his head above the others, whilst he, Herr Teufelsdröckh, was serenely alone with the stars. There he was able to arrive at sundry novel conclusions, among which, that tattooing and painting had priority to clothing, and that the first spiritual want of a barbarous man is decorations, indeed, we still see among the barbarous classes in the most civilized countries." The Professor of Things in General had never found an infinitely finer observatory if he could have lived in a modern American city, such as Chicago or New York. He would have attained a much loftier elevation and have had beneath him more numerous specimens

of the human apparitions that were passing from eternity towards eternity. He would have blessed science which made such standpoints possible. But the poverty-stricken Professor would not be regarded as an eligible tenant for the smallest or the most inaccessible of the rooms. He would, however, have been willing to acknowledge that science had created in the tall building the materials for a new chapter on the famous Clothes Philosophy. For what is one of those lofty structures but a vesture or raiment in stone and marble and coloured substances, covering a skeleton of bones and concrete which it would be inconvenient to exhibit? "The benignant efficacies of concealment," said the Professor, "who shall speak or sing?" And in an American office building concealment is complete. Then, too, was there ever such a symbol of developed man? "Did not the whole Hungarian nation," asks TEUFELSDRÖCKH, "rise like some tumultuous moon-stirred Atlantic when Kaiser JOSEPH pocketed their iron crown—an implement, as was sagaciously observed, in size and commercial value little differing from a horseshoe?" But what is an iron crown in comparison with an immense caisson, grillage, girder, column or bracing of the exalted structures in American streets? From his watch-tower in the Wahngasse he could only see signs of a deceased or expiring society, but from a twentieth or thirtieth storey in New York he might discover the beginning of one that is new, but not, however, independent of the past; for if, as we are told, TUBAL CAIN was the maker of the tailor's needle, may we not with equal reason give him credit for the elaborate framework of American buildings? Thebes, it is said, was built by the sound of the lyre of ORPHEUS or AMPHION; but the Professor held that the transforming of sandstone rocks into Doric and Ionic pillars, squared ashlar houses and the noble streets of Weissnichtwo was also a similar feat; for without the music of some inspired ORPHEUS no city was ever built, no work that man gloried in was ever done.

The new American buildings may be as much of a surprise to us as they would be to any of the Knickerbockers or other Dutch settlers of New York. But they can claim to be called into existence by imperative necessities and not by fashion or whims. Instead of posing as a Venetian or Florentine financier or a merchant of the Renaissance age, and constructing a building that would be a copy of one he admired abroad, the modern American business man is content to accept the most convenient arrangements with which invention can supply him. Time is money with him, and in the new buildings we see the utmost respect for it. To Europeans it seems incredible that seven complete tiers composed of materials weighing between 7,000 and 8,000 tons were raised within nine weeks. A gang of twenty men, with the aid of derricks, are able to erect twenty bays a day, each being 24 feet square. The metal framework of a seventeen-storeyed building in Chicago from basement columns to finished roof was set up in nine weeks. In another building the entire skeleton, above the first floor, of nineteen storeys and an attic was erected in twenty-six days without overtime or night-work. The steel framing of an eighteen-storey building was put up in two months. The following cases will suggest how continuous was the expedition:—

The skeleton or "vener" type of construction possesses great advantages in economy of time required for erection, as work can be pushed on the walls at different storeys at one and the same time. Thus on the Manhattan Building, Chicago, the main cornice of terra-cotta was completed before the wall was built up beneath it. On the Unity Building the granite base-wall was being built at the first and second storeys, the pressed-brick face was being placed at the twelfth-floor level, while the hollow-tile arches were being set for the fifteenth floor all at the same time. The rapid progress made in the erection of the New York Life Building, Chicago, is shown by the following:—

- July 17.—Old building torn down to grade.
- July 31.—Laid out new footings.
- August 17.—Started setting basement columns.
- August 31.—Started laying granite.
- September 5.—Started setting tile arches.
- September 18.—Started laying terra-cotta facing.
- September 29.—All steel set.
- November 9.—Tile floors all set.
- November 11.—Terra-cotta all set.
- November 12.—Started plaster.

\**Architectural Engineering. With especial reference to High Building Construction, including many examples of Prominent Office Buildings.* By J. Kendall Freitag, B.S., C.E. (New York: John Wiley & Sons. London: Chapman & Hall, Ltd.)

December 2.—Steam plant completed. Turned steam on in building.

Of the 671 individual columns in this building, but a single one required "shimming." A thin steel-wedged plate was used, forged to fit. The columns were tested for alignment at frequent intervals. An average of 25 working hours was required to set the steelwork for a complete storey. The following dates will serve to show the time required in the erection of one of the latest New York office buildings, viz the eighteen-storey Atlantic Building, corner of Wall and William Streets (Clinton & Russell, architects):—

May 9, 1900.—Tearing down started.

June 15, 1900.—Caisson foundation started.

September 1, 1900.—Steel framework started.

October 8, 1900.—Brickwork started on street fronts.

December 10, 1900.—Building topped out.

January 1, 1901.—Steam turned on.

January 22, 1901.—First hydraulic elevator started.

March 1, 1901.—First offices ready for tenants.

The mention of only a single column needing shimming is enough to suggest one of the reasons for the despatch. The framing, whether columns or beams, was carefully executed elsewhere, and they came to the site like the different parts of a watch. Nor can it be objected that the facility with which the buildings are raised is a cause of danger. Opinions may differ about the wear of steel and iron and about the action of lime, cement and concrete, but the risks would not be diminished if the uniting of the materials occupied a longer time. The principal object to be attained is the securing of the numerous pieces of which such a building is made up. The by-laws in towns are careful in enacting rules on the subject, and in discriminating between loads which fall upon the frame and those which are borne by masonry. The buildings may be condemned as being unusually monotonous in appearance, but the expeditious construction which takes place every day would be impossible unless there was correspondence between the parts. The extent to which the preparation of parts is carried is shown by the following passage:—

For the successful erection of the frame much depends upon an accurate alignment of the column bases. These should be carefully tested both as to position and level. The bases are either grouted with cement or bolted to the foundations, but where cast column bases rest on masonry piers or footings any considerable grouting is not advisable. The only grouting that should be permitted in tall buildings would be in levelling up the tops of the concrete footings to receive the masonry courses, or in a very thin layer between the column pedestal and the masonry bed. The cap-stones should always be brought to the most accurate bed possible, with grouting used as a thin cement and not as a leveller. Accurate redressing of the cap-stones after setting is much to be preferred. All rivetting and punching of the steel members is done at the shop, besides the usual coat of oil or paint. This leaves only the assembling and field rivetting to be done on the ground, including the adjustment of the laterals or wind bracing, the placing of separators and tie-rods and the field painting. The columns are now generally made in two-storey lengths, or occasionally in three-storey lengths, and this practice aids much in saving time and expense in erection.

It is an advantage of American books on technical subjects that they appear to be written as if the author expected his statements to be immediately tested by practice. Mr. FREITAG'S book is an excellent example. He describes all stages of the work from its inception, and his volume can therefore be utilised not only in architects' offices but on ironworks and in the erection of the building. Unlike in England, there is no fear in America of diffusing a knowledge of novelties in construction, and Mr. FREITAG has been able to draw upon several well-known architects who have had experience in erecting high buildings in the United States for the results of different methods. It should also be remarked that the volume advocates no particular system, and throughout impartiality is shown.

Mr. FREITAG is of opinion that in the American towns the normal loads on floors are taken too high. In Chicago and Boston the live load is 100 lbs. per square foot, while in New York it is 150 lbs. for the first floor and 75 lbs. for the upper floors. A few years ago experiments were made in 210 offices in Boston, and it was found that the weight of people in them, with the office furniture, ranged from 16.2 lbs. to 17 lbs. per square foot. For ten heavy offices the

weight was 33.3 lbs., and one reached 40.2 lbs. 35 lbs. to 40 lbs. would therefore appear to be an assumption. Mr. SHANKLAND, who has had a wide experience in Chicago, says that "the weight of the tenants and furniture of a typical office have been found by experiment to be only 6 lbs. or 7 lbs. per square foot; it certainly does not exceed 12 lbs. The average weight of the partition walls is 25 lbs. per square foot of floor." He takes the live load between 60 lbs. and 75 lbs. per square foot for the floors of a building, and between 75 lbs. and 100 lbs. for the first and second floors, which in America may be for shops and banks. Not only is the weight allowed by the municipal laws too high, but in Chicago it is ordered that every part of a floor should be able to support a load of 100 lbs. per square foot, in addition to permanent fixtures and mechanisms. By this arrangement the beams must be strong enough to be independent of the columns. There is likewise a want of uniformity in the regulations in different towns. A warehouse in New York is supposed to bear a load of 100 lbs. per square foot, while in Philadelphia it is 120 to 150 lbs., and in Boston 250 lbs.

Mr. FREITAG also points out the absence of agreement as to the most economical arrangement of floor-beams, as well as in their proportioning. The utmost demand according to him, should not exceed  $\frac{1}{360}$  of the clear span. It is recommended that as few sizes of floor-joints and girders, and as few weights of beams and channels, as possible, should be specified as is practicable, for any way delay will be avoided. In America standard connections for uniting beams can be obtained; this is a great convenience, but they should not always be used with a blind confidence that their strength is uniform. Mr. FREITAG says:—

For the connections of beams to beams, or beams to columns, connection-angles made after the standards adopted by the Carnegie Steel Company or the Peacock Iron Works are almost universally employed on good work. The adoption of such uniform "standards" is certainly a great help to the mills and bridge or iron shops, as well as to the designer in the hands of the careless or ignorant designer, is an element of weakness. From careful observation of the methods, as practised in general, the writer is convinced that faulty details constitute an even greater part of the error in the general run of buildings than arises from poor workmanship or imperfect general features of design. "Standards" are therefore to be used with caution, and the careless designer to use them under all circumstances, whether they be adequate or not. They are standards, and they must be all-sufficient.

In America it is usual for the manufacturer to supply the detailed drawings, a practice of which Mr. FREITAG does not approve, but it is not always the case. An expert in steelwork is to be found in an architect's office, one who is able to facilitate economy in price. Slight shortcomings in drawings may mean the addition of respectable sums to estimates in order to provide for contingencies.

"Cage construction" steel frames are now generally adopted. They have the advantage that the weight is thrown on the columns, and the stone or concrete is not required for it, is little more than a veneering which is required to do more than look efficient. The system leads to an increased use of terra-cotta, for the manufacturer "design their pieces with especial reference to tying or suspending them from such a framework; so that the building becomes nothing more nor less than a vital skeleton of steel, with an architectural and decorative wrapper of terra-cotta, tile or brickwork, inside and out." All this may seem unworthy to be called architecture, but as TEUFELSDRÖCKH exclaims, "Who is there to clutch on to the wheel-spokes of Destiny, and say to it, 'Turn back, I command thee?' Well, it is that we yielded to the inevitable and inexorable, and accounted even this the best."

It is found that when fires occur brick and stone veneering is far safer than any slabs of masonry. Chicago by-laws stone appears as if it were without structural value, and the iron or steel framing is protected by brick, terra cotta or fireclay tiles. In such cases should be used in facing it is only regarded as a

ditional thickness to the other materials. It will suggest economy of space which is the result of steel construction when it is stated that in a building in New York, which is 141 feet high, the enclosing walls are no more than 12 and 16 inches thick, instead of 6 feet, which would be demanded by most building laws. In the treatment of windows and other parts remarkable ingenuity is exercised in adapting the materials to the requirements. In all cases cast-iron, although it would be more convenient, is avoided.

Cast-iron columns are employed in ten to sixteen-story buildings. Mr. FREITAG, however, is opposed to their adoption, and he wonders why architects should insist in using them, even at the request of an owner. Experiments made by the New York Building Department in 1896 and 1897 demonstrated that GORDON'S or GOLD'S formula is not to be relied on, for columns are under half the calculated stresses. According to Professor BURR, the use of cast-iron columns cannot be justified on any reasonable ground.

Mr. FREITAG gives much attention to the subject of columns, of which several varieties are produced. Columns made of latticed angles and channels should, he says, be confined to moderate loads and upper storeys. A Z-bar column he reckons one of the most advanced, but if more sectional area is required the box column is better able to sustain vast loads. In the two best buildings in Chicago and New York box columns are used. The number of sections of columns adds much weight to this part of the volume. Cast-iron base-plates are in use, but for heavier loads shoes of steel plates and angles are preferable. Care is taken in America to prepare load sheets showing by tables the load which is sustained by every column on the different floors. The boldness of American designers is proved when we find that in the Schiller Hotel at Chicago there are columns of the length of 10 feet 10 inches, each weighing 25,000 lbs., and at the Chicago Board of Trade there are columns 90 feet long and a diameter of 3 feet 3 inches. Bracing is an important part in American building, as winds appear to be more of a force than with us; the various expedients for security are given at length.

The Americans have to take many precautions with foundations in order to insure the stability of the high buildings. The following are the safe loads recognised by the New York Building Code:—"Soft clay, one ton per square foot; ordinary clay and sand together, in layers, wet and springy, two tons per square foot; loam, clay or fine sand, firm and dry, three tons per square foot; very firm sand, stiff gravel or hard clay, four tons per square foot, or as otherwise determined by the Commissioner of Buildings having jurisdiction." In Chicago the highest loads recognised are 4,500 lbs. per square foot. It is necessary therefore to devise remarkable methods to overcome the shortcomings of the natural foundations. The expense is sometimes inevitable, as is exemplified by a building in San Francisco which is 75 feet square. Below the level of the site, at a depth of 25 feet, is a concrete platform 100 feet by 100 feet, and 2 feet thick. On this is a layer of heavy rolled girders, making a continuous beam 96 feet long. Above are alternate layers of concrete and girders, the area thus constructed is 70 per cent. greater than the actual floor area of the building. By this costly arrangement it is calculated the pressure on the earth's surface will not exceed 4,500 lbs. per square foot.

The publication of Mr. FREITAG'S "Architectural Engineering" is opportune. In large girders and bridge-work the Americans have of late contrived to gain advantage over us, especially in contracts with the Government. It will not be for want of endeavours on their part if they will fail to carry off contracts for girders and columns to be used in buildings. They have the advantage that their work is openly recognised, whilst with us, owing to the prevalence of dilettanteism and the ignorance of statical conditions, the use of the material is thought to be inartistic, or at least only one of the necessary evils of modern architecture. The Americans have market sections which are used for general use. In consequence they are always able to produce beams and columns which are equal to the loads at a very short notice. There is also much more confidence in the judgment of manufacturers than is

allowed with us. All this and much more will be gleaned from Mr. FREITAG'S volume. We have a careful representation of American practice, which we must respect, although nothing is done which is not feasible in England also if like conditions prevailed among us. Mr. FREITAG can speak with authority of the development of constructional steel in many buildings, and his book deserves serious consideration by all who are directly or indirectly engaged in that mode of construction. It is a practical book in the best sense of the term, and the information it affords will well repay a purchaser. We hope it will lead to a wiser recognition of iron and steel, with an increase of metal construction among us. For, as TEUFELSDRÖCKH, the first philosopher of skyscrapers said:—"Produce! Produce! Were it but the pitifullest infinitesimal fraction of a product, produce it."

### THE BIRMINGHAM SCHOOL BOARD AND THEIR ARCHITECT.

AT the meeting of the Birmingham School Board on February 1, Mr. Bethune Baker presented the report of the sites and buildings committee, who recommended that "three months' notice be given to Messrs. Martin & Martin, architects and surveyors to the Board, to terminate their engagements, all work which they have now in hand for the Board to be completed by them on the existing terms; that the Board advertise for an architect to be the architect to the Board at a remuneration of 600*l.* per annum, and that a further appointment be made by the Board, in consultation with the architect, of a skilled draughtsman and an assistant, who together shall be paid a sum not exceeding 300*l.* per annum, such officer to devote his whole time to the duties and to work in the Board office, all necessary office furniture, stationery, &c., being provided by the Board. Both appointments to be for three years on the understanding that the architect shall finish work on which he is engaged at the time of the termination of his appointment, and that both appointments shall be subject to three months' notice on either side at any time during the three years. Further, that the Board advertise for a land surveyor at a commission of  $\frac{3}{4}$  per cent. on the purchase money, and also a quantity surveyor, at a rate of remuneration of 1*½* per cent. on the tenders. These two latter appointments also to be for three years, subject to three months' notice at any time on either side." Mr. Baker at the outset said he desired to make an alteration in the wording of the resolution, as under it they would have two architects running for three months, but on the suggestion of the Chairman he agreed to move it as a rider to the original resolution. Mr. Baker then went on to explain that the task of moving the resolution was not a congenial task, because it did not exactly commend itself to his judgment neither from an economical point of view nor yet from the probability of their getting the best results architecturally. He felt, however, that weight was due to the long experience of the minority of the Board, and that, coupled with the fact that certain members on his side favoured the resolution, prevented him from opposing it as he should otherwise have done. He felt that under the arrangement proposed the Board would spend more money for their work than they had hitherto done. Why were they going to pay more money? Was it because the present architects had managed somehow to get wind of the pending rearrangement, and had taken the bull by the horns and asked the Board to reconsider their terms, on the ground that the present terms did not pay?

The Rev. Joseph Wood seconded the resolution, and said he was not particularly in love with it any more than the chairman. It represented part of the policy of change for the sake of change which had been pursued more or less during the last fifteen months. He was not in sympathy with the chairman of the committee in his remarks, and still less with his proposed rider. The Board in any case would not pay for the same work twice. He quoted figures and contended that they were going to pay about the same amount under the new arrangement as they had in the past, providing the same amount of work was done, but if there was more work the new arrangement would be cheaper. He seconded the resolution because it represented a sort of compromise they came to in committee.

Mr. Pentland opposed the resolution on the ground that he would like to see the matter thrown open to competition, and moved that the whole matter should be referred back to the committee.

Mr. Ansell said he was anxious to do what was right, but had no guidance as to what course he should pursue.

Mr. Kenrick pointed out that the new arrangement became a necessity because the architects were not willing to go on at the old terms. The matter had been gone into thoroughly in committee.

The Chairman said there was a time when he thought it would be a good thing to have architects competing for plans, but as the result of inquiries he found that when plans were competed for one firm was successful year after year, and that proceeding simply involved a waste of money. When architects were paid partly or wholly by commission it could hardly be possible, human nature being what it was, that they should make economy their principal study, or even their serious study at all. The Board wanted to arrive at some arrangement whereby the architect should have no interest diverging from that of the Board. Personally, he anticipated a great saving from the scheme providing it was coupled with some such rider as Mr. Baker had indicated.

Mr. Baker then proposed the following as a rider to the resolution:—"That until Messrs. Martin's notice has expired the new architect of the Board be paid according to work done by a special arrangement between the Board and himself, and after that at a fixed salary."

The Rev. Allen Bell seconded the rider.

The original resolution was put first and carried, the whole of the members with the exception of Mr. Pentland, who voted in the negative, and Messrs. Ansell and Baker, who abstained from voting, being in favour of it. It was therefore carried. The rider was then put and carried, seven members supporting it, five voting against it and two remaining neutral.

The following letter has been addressed to the chairman by Mr. William Henman:—

To the Chairman of the Birmingham School Board.

My Lord Bishop,—You are reported in this day's *Post* to have said at yesterday's meeting of the School Board:—"When architects were paid partly or wholly by commission it could hardly be possible, human nature being what it was, that they should make economy their principal study, or even their serious study at all." May I be permitted to point out that such a statement, particularly from one holding the position you do, is a serious slur upon the integrity of a body of men whose training, studies and the conditions of membership of the Royal Institute of British Architects and allied societies inculcate a high standard of honourable practice; and also that it is inconsistent with the action of the School Board, supported by your vote, in appointing a land surveyor and a quantity surveyor on commission.

I am not fully acquainted with the duties such land surveyor may be called upon to perform, but, if he has to estimate the value of land to be acquired by the Board, he might just as reasonably be accused of putting an excessive value thereon to augment his commission as that an architect should be charged with failing to exercise reasonable economy for the same purpose. As regards quantity surveyors, the cost of a building depends to a greater extent upon their work than it is in the power of an architect to control after his design has been accepted; yet I should be sorry to say that any responsible quantity surveyor would wilfully draw up his schedules in a manner to increase cost for the purpose of adding to his commission.

As one of the deputation who had the honour of making representations to your Board against the appointment of a salaried architect, I desire, now that the definite proposals are known, to direct attention to the questionable advantages likely to result on the score of economy.

It is generally recognised that an architect's expenses for office rent, assistance, stationery, &c., average one-third of his commission, yet your Board have decided to provide assistance to the amount of one-half the salary of the architect's; and office rent, furniture, and stationery will probably cost at least 200*l.* a year, or a total of five-elevenths instead of one-third of the architect's gross remuneration, from which some deduction in the way of expenses may have to be made; or, in other words, on an annual expenditure of, say, 1,100*l.*, the remuneration for thought, intelligent control, inventive and constructional ability and experience is reduced by quite 150*l.* a year below what is generally considered to be a very reasonable payment for such services; and it may with propriety be asked why it is that the chief educational authority of the city so far undervalues mental abilities and at the same time puts a premium on routine and mechanical services.

I may also point out that as the resolution appears in the *Post* it is far from clear who is the "officer" who is "to devote his whole time to the duties and to work in the Board office." Three officers are mentioned, viz. the architect, the skilled draughtsman, and the assistant. If the architect is referred to, are the draughtsman and assistant to be allowed to undertake outside work? If it is the draughtsman or the assistant, how can the architect, who presumably can engage in private practice, exercise that constant control and supervision which is so essential to the effective carrying out of architectural work?

Although not an advocate for indiscriminate competition, I have recollection of at least three architects having been employed by the School Board as a result of competition. May I, therefore, ask for a list of schools for which architects have

competed, the dates thereof, and the names of the architect employed, so that it may be realised if you have been informed that "one firm was successful year after year?"

I am sending copies of this letter to the Press, and you will not object to any reply with which you may favour having equal publicity.

The Bishop of Coventry has replied as follows:—

St. Philip's Rectory, February 3,

Dear Mr. Henman,—My statement that architects' commission could hardly make economy "their study" was not a reflection upon an honourable profession, many members of which I have the advantage of knowing among my friends, but upon "human nature, being what it is." Given on the one side the ratepayers' purse, the desire to produce artistic results, and a percentage on the costs, on the other side a conscientious and pious wish for economy, strain upon "human nature, being what it is," is excessive.

As to the inconsistency, which you point out, of paying and quantity surveyors by percentage, I admit that; but if methods of payment were possible I should prefer them to the present, and am not aware of them.

As to your calculation of the cost of rent, furniture, stationery, you are probably not aware that we have Board premises unused office room quite sufficient for our purpose, and the advantage at which we aim is that of more directly under our control the designing of repairs and alterations, which must be very expensive items to the ratepayers' years to come. Designs for repairs so expensive as to be prohibitive of their adoption must occur where architects are outside the Board offices. Yet architects paid by commission must be paid for these unused designs. This is an unnecessary leakage and a hindrance to the work of repairs which we are anxious to avoid.

As to the proportions in which the architect and his officials are to be paid, taking your reckoning that other expenses consume one-third of the architect's salary, bearing in mind that the Board proposes to take on its own expenses, the salary which we offer is, by your reckoning, equivalent to 800*l.* to the architect out of about 1,000*l.* will be the whole cost to us. We are therefore paying the architect exactly in the proportion which you believe to be fair and equitable.

As to your further question, it is the draughtsman and assistant who are to give their whole time to the Board, not the architect.

What I said about one firm being successful year after year was said of other towns, the chief instance in my mind being Leicester.

## WOLVERHAMPTON ARCHITECTURAL ASSOCIATION.

THE first annual general meeting of the Wolverhampton and District Association was held at the Law Rooms, Wolverhampton, on January 16, and was well attended. The annual report of the Council for the year 1909 was read and adopted, and the accounts passed and approved. The following officers were re-elected for 1909:—President, J. Lavender; vice-president, G. H. Stanger; council, F. Lynes, T. H. Fleeming, S. H. Eachus; hon. treasurer, J. Weller; hon. secretary, W. Edwards, 25 Dale Street, Wolverhampton; auditor, W. J. Oliver.

The President delivered an address, in which he said:—

May I very humbly offer you a few thoughts on the architect's duties—to his client, to his contractor, to his art.

The client should have first demands on our consideration for two reasons:—(a) He pays our fees. (b) He gives us the opportunity of showing our skill. I will confine myself to the former of these two reasons.

*He Pays Our Fees.*—Do we always sufficiently realise the fact that consequently our best, our very best talents, on such work belong to him, and that it would be simply dishonest of us not to give our best to his work? As a rule he puts confidence in his architect and tells him how much he wants to spend. It is for us, then, to honour that trust and see if it is possible. I admit it often is not that our design does not lead to extra cost; but it often happens that the accommodation for is utterly impossible to give for the sum he names. We should tell him so at once and not give him reason that he can do the work for the sum named when we cannot. It is no excuse for us to say, Well, if he wants to have to pay for it. I reiterate, the client has the best talents, and one of them is that we know better than a building will cost, and to keep this knowledge from him I say unhesitatingly, dishonest. It may be said, "But he will lose the job." Very well; better so a thousand times than to mislead. But we may see that the building can be built for the money without lavish architectural treatment. Then let us relinquish our own wish for architectural display.

is to our client. Then as to preparing very careful drawings and specification, we should mind this, for in this way we spare our client many extras. Our best must be given, so should consider well every little detail, and not leave it to cleared up as we go on, and put in an extra for it. Incompetence, too; we must remember we are being paid for this, and should not shirk a journey or two, nor say to the client, "I leave it to your judgment." He is not paid for it; we are.

*His Duties to the Builder.*—Has he any? Most decidedly. Men think what gracious men the builders must be that practically place their profits or loss in the hands of the architect. The architect orders this and it must be done, the architect says that is wrong and it must be undone. The architect is despotic—he has enormous power, but the evidence thus willingly placed in his hands should be respected. Some architects (of course present company excepted) I know are most arbitrary—they are, in other words, big, too high and mighty. I have specified so and so and carry it out. Are architects infallible? Very often the architect considers it is part of a builder's principle to be unprincipled, and that he will take him in if possible, and he is so far as to warn the architect to be on his guard, "for architects are rogues." Now, what should we do without architects? My experience leads me to say that on the whole architects are honourable men, and willing to do all that is reasonable. There are exceptions, which to my cost I have dealings with; but, as a rule, I find builders most obliging and honourable, and the rogues few and far between. A word about detail drawings. I think a very important duty of an architect to the builder is that he is prompt in supplying the details he asks for and requires. It is not fair to expect the builder to fulfil his contract if we keep him waiting for details, yet I am afraid this often happens.

*His Duty to his Art.*—Our art has a noble and ancient history. Architecture is the most ancient of all arts, its birth being almost coeval with the creation of man upon this earth. Then the architects of to-day are the representatives of this ancient art, we owe a great duty to it. When we consider the buildings of the Egyptians, the sublime grandeur and sensitive delicateness of the Grecian, the exquisite proportions of the Roman buildings, then the graceful and soaring architecture of the Middle Ages, surely the responsibility of our art appears in all its urgent demands, but how are we doing our duty in the face of so magnificent a heritage? Are we faithful to our high and great legacy? One reason to my mind of those past great achievements in architecture was that the architect (as Longfellow tells us) "built his great heart into sculptural stones." Art was first, fees second. Is it with us? I am afraid we often think of fees and then our art. We make our art too much a commercial transaction; our heart should be in our art if we emulate our great predecessors. It is no answer for us to say, Ah! but we have no cathedrals to design and build. That matter? The great Architect Almighty has given us care and put as much design and work, perhaps more, in the little butterfly as He has into the monster elephant or the whale. And in our small work there is as much need for care and attention as in cathedrals or municipal buildings. I say it is our duty to see that we do not neglect these smaller things. There is to-day a great tendency for novelty for the sake, and you say, Well, our client will have it. Ah! it is our duty to our art demands that we shall not give it. Art and I feel confident if we stick to this determination the public will yield, and we shall not drag our noble art in the mud and filth of idiotic ignorance and vulgarity. You may say, What lines would you go upon? I say at once, utilitarian lines of the last century lines clothed with the purity of architectural beauty.

We have been tied and bound too long; do not be copyists, and stick too fast to modules and such like; architecture knows no laws or rules that would hamper invention. I say again, whatever use demands in building architecture can give. And it is for us, who wield the pencil, to work out how it is to be done. Were the old architectural designers ever hampered as we allow ourselves to be in addition had to be made to a building, though a hundred years had elapsed since its erection? Did they go and search and copy every detail of moulding and carving that they might match? We know just the opposite. Hence the great beauty which we now admire in Gothic buildings, especially those which show to us various styles in one building. Were they fools? Did their employers say they did not like their work? Why then are we to be tied down by spurious ideas that in our new buildings we must be so careful that our mouldings, &c., are what we please to call them? I admit that there is appropriateness in the choice of one kind of moulding with a certain style or order of architecture; but surely there is a limit. Now if an architect is building to erect and sticks a portion of the façade of the Horse Guards to it, it goes for architecture. I grant it is a good copy, but not art. The honour of it belongs to

Kent, the architect of the Horse Guards. But to my mind the architect of the little villa down the road who has first made his plan to suit his client and then clothed it in elevation with the cloak that will fit it is by far the nobler man, and has taken up the mantle fallen upon him to more purpose than the robber of other and dead men's brains. But you may say, If we don't design according to ancient models the public will say we are ignorant. I don't believe it for a moment. Art is art, and if it is true, common sense, original architecture it will demand and receive its reward. What a bugbear and hindrance it is to us, the public prejudice for old designs; but we have a duty to our art and to future generations of architects which behoves us to break free from these trammels. A word on the fashion of trying to be odd and eccentric in our design. This is to my mind one of the worst sins of the present-day architect. If because we want a pretty corner in a room on our plans it necessitates a peculiar jutting gable or hip on an elevation, this is legitimate, but to my mind it is a libel upon architecture to make an awkward corner in a building simply to create an odd appearance outside. True architecture, I take it, is first necessity, and utility in plans and arrangement; then architecture is so pliable that it will clothe elegantly if the architect has the ability to do it. Again, why should you run up a gable just for appearance? I was in a neighbouring town a short time ago, and was greatly surprised to find a most elaborate gable erected over an otherwise good building; it was utterly useless, and had to be tied up with an iron rod, as I saw from a distance. Poor, poor architect, to stoop to such defilement of this art. Do you say, then, I do not agree with architectural effect for its own sake? Most certainly I do, but a sham in any form I abominate, and especially in architecture. A gable is the natural and architectural finish of a span roof, but it is not architecture to form a span roof—a false roof—just to put up an elaborate gable. There are means for architectural embellishment which even to the uneducated eye proclaim the fact at once, but it is degrading to our art, and shows great lack of architectural talent in the architect to erect constructional features simply and only as ornaments. Let us have purity by all means. I have no quarrel with those who like elaborate or ornate buildings—as much of ornament as you like, only for our art's sake let it be ornament, not constructional features falsely used. Neither let us be odd for oddity's sake. Be true to your art and your art will serve you in all emergencies.

### HARTLEBURY CASTLE.

AT the last meeting of the Worcester Diocesan Architectural and Archaeological Society the Rev. D. Robertson, M.A., read a paper upon the history of the parish and castle of Hartlebury, Rev J. B. Wilson presiding.

The Chairman, introducing Mr. Robertson, said that perhaps no one living knew so much about Hartlebury as the rector (Mr. Robertson). Hartlebury Castle was particularly interesting, and in recent times it had become more interesting than ever. Therefore it was with great pleasure they looked forward to Mr. Robertson's paper.

It dealt at great length with the history of the episcopal palace and the notable bishops who had lived and laboured there, and with the church and the rectors of the parish. In conclusion, Mr. Robertson spoke on the proposition to abandon the castle as the episcopal residence of the diocese. He said they would dishonour the memories of all the former bishops of the see if they put up for auction their venerable and beautiful home for 800 years. A proposal would be made to the Ecclesiastical Commissioners to sell the castle—to sell the place where great benefactors of the Church, where martyrs such as Hooper and Latimer, confessors such as Lloyd, archbishops such as Whitgift, and divines such as Bentley and Stillingfleet and Sandys had lived and laboured—to sell the chapel consecrated for centuries by the toil of worthy and illustrious Churchmen. It would lower the prestige of the see, and break up the whole history of the diocese to part with all the sweet and holy associations that hung around the walls as though they could order down new ones from Whiteley's or the stores. Precious heritages such as those might be taken from them by the enemies of the Church, as other things were taken from them in the days of the Commonwealth, but let them have no hand in parting with them. On the contrary, let them do their best to preserve them.

The Chairman said they were very much obliged to Mr. Robertson for his paper, and particularly for his earnest words on the terrible catastrophe that was looming before them with regard to the episcopal palace, which many of them had been dreading. He thought the majority of Churchmen in the diocese would join in deprecating such a step as was proposed. They hoped that none of them would ever live to see such a catastrophe as a parting with Hartlebury Castle as the residence of the Bishop of Worcester.

### NOTES AND COMMENTS.

THE International Historic Congress which is to be shortly held in Rome will be of unusual interest. No other city has so enduring a history, for it exemplifies Classical antiquity, the Dark Ages, Mediævalism, the Renaissance, as well as modern history. The Vatican by itself would be sufficient to afford materials for the consideration of several congresses. A preparatory meeting will take place in Venice on April 10, and the meetings in Rome will probably begin about the 14th. It has been decided to have sixteen sections, viz. ethnology and classic archaeology, numismatics, Eastern and Classic peoples, antique literature, ancient law, the Middle Ages and modern times as exemplified in diplomatic and other archives, Mediæval and modern literature, Mediæval and modern art, modern law, political and social economy, philosophy and teaching, religion, geographical discoveries, mathematics and experimental science, music and dramatic art, historical methods. With the exception of medicine, it will be seen that almost the whole circle of knowledge comes within the scope of the Congress. It was understood that the King of ITALY was to preside over the section of geographical discovery, but the chair will be filled by Prince LOUIS OF SAVOY, who has taken part in several explorations. A great many authorities in history as well as archaeologists have announced their intention to be present. The secretary is Professor GIACOMO GORRINI, of Rome.

PEOPLE who wish to see the Salon this year should not delay their visit. The building in the Champs-Élysées, in which the rival societies are to display their works, will be required some time in May in order to exhibit the results of the visits of M. DE MORGAN to the East. We have already alluded to some of his discoveries. It was first contemplated to display them in the Louvre, where, no doubt, a section will find a permanent home, but the large number of objects demanded more space than was available, and it was therefore resolved to utilise the Grand Palais. It is possible that the pictures and the antiquities may be accommodated, and the contrast between ancient and modern art under the same roof might be a novel attraction for visitors. But as the Government has more interest in the results of M. DE MORGAN'S expenditure than in the works of the members of the two societies, it is not unlikely the latter will have to succumb.

EVERY experienced surveyor must often be horrified when he observes the careless way in which boundaries of property are indicated on plans, especially on those which solicitors have prepared in law-writing offices. Colour is laid on as if it were only intended to be an ornamental border to fields. As a consequence law suits are continually arising over disputes about boundaries. At one time the spectacle was to be witnessed of one of the high roads within the metropolitan area in which only one-half was cleansed or kept in repair. The authorities on one side believed that the boundary of the parish was in the middle of the road, and kept their part in order, while the authority on the other side believed no portion of the road was in their parish. Until the question was settled at great expense in the law courts much inconvenience was felt by the inhabitants of the district. The case of the Earl of CRAVEN *v.* PRIDMORE and Others, which was heard in the Court of Appeal on Saturday, turned on the question whether a fence belonged to plaintiff or defendants. The fence had a ditch on one side, and therefore it was assumed that the ditch as well as the fence was the property of the plaintiff. It was remarkable that in some of the parish maps the fence and not the ditch was distinctly marked as the boundary, and it was argued that the boundary of the parish and of the properties must coincide. Mr. Justice RIDLEY, when he tried the case, decided in favour of the defendants on that account. The Court of Appeal, however, took the opposite view. It was considered that according to custom the boundary between the properties ran along the edge of the ditch, and the fence would therefore belong to the plaintiff. The view was confirmed by one estate map. In cases of the kind, when it is almost impossible to be definite in marking the boundaries unless the plan is on a large scale, the difficulty

could easily be surmounted by drawing a small section the ditch and fence, and indicating the boundary upon it. It must be allowed, however, that the determination of boundary is not always practicable, and a surveyor obliged to make the best of the information he receives although he is convinced it is only one-sided.

THE committee of the Liverpool Cathedral must at this time have discovered that, no matter what site may be selected, opposition to it is certain to arise. Whether funds suffer in consequence is doubtful. It may be able in competition tactics to endeavour to scare architects who propose to contribute designs, and by that means reduce the number of combatants. But the men who would accept the risks of so vast a work as is proposed in Liverpool cannot be very numerous, and they are not likely to pay much attention to the would-be disinterestedness which has been manifested in connection with the project. What is more pitiful is to find the project converted into a political move. It has been stated that there is a very close connection between the majority of the Cathedral Council and the cathedral committee, both representing the same party. As far as we can make out, the aim of church committees everywhere is to utilise the parties in order to attain the object in view, and there has been no official utterance by the cathedral committee which can be accepted as a war cry. When the scheme was first brought forward we pointed out that Liverpool was in a different condition to any of the Mediæval cities. In the twelfth and thirteenth centuries the Church continued to be powerful, and was able to obtain the most suitable site for a building in which all the people were intended to have a share. But when cities, as is the case in Liverpool, have acquired a certain fixed arrangement which was determined by secular affairs, all that can be accomplished is a sort of compromise. Some allowance should be made for devotional needs. The St. James Mount site is free from all undue noise and disturbance; it is spacious, accessible and prominent. Having these advantages, architectural display, which can only be an individual, must be a minor consideration.

M. PIERRE LOTI, although a naval officer on active service, is recognised as one of the most charming of living writers of French prose, and he has deservedly gained the chair in the Académie Française. It may surprise some of his admirers in this country to learn that he is also a painter, although the attention to colour and form which marks his writing should be taken as characteristics of a votary of the fine arts. In one of the Coptic churches in Constantinople there is an altar-piece from his hand, which represents St. BASIL, one of the early Fathers, whose writings exercised much influence upon the Oxford school of the nineteenth century. M. PIERRE LOTI, or rather M. JULIEN VIAUD, while on service in the Bosphorus, received lessons in the Coptic language from the monks of the church, and out of gratitude he painted the altar-piece.

ST. MARY'S CHURCH, ECCLESTON, NAVE, LOOKING WEST.

DEMLOSKIN, DUNBREEK, N.E.

ST. ENOCH'S SUBWAY STATION, GLASGOW.

THE GREEN, CLEY-BY-SEA, NORFOLK.

ABBESS GRANGE, HANTS: DRAWING-ROOM. LIBRARY.

THESE illustrations refer to the house, drawings of which we have already published. The interior has been panelled either in oak or pine throughout. The library is panelled nearly the whole height, and the place, overmantel and marble mantel is of the design illustrated. The ceiling is of anaglypta, and is of the same character. The drawing-room panelling is carried out in pine and painted ivory white, the panels being faced with silk and is of a special design as shown. The architect's fireplace is of red Verona marble and the sides lined with green glazed tiles.

The panelling throughout has been carried out by J. P. WHITE, of Bedford, to the detail drawings of the architects, Messrs. BANISTER FLETCHER & SONS, 29 Bridge Street, Ludgate Circus, E.C.

# THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last at Conduit Street, Mr. W. H. Seth-Smith, president, in the chair.

The following gentlemen were elected members:—Messrs. Christie, A. L. W. Sampson and R. S. Wilkinson.

The total amount of subscriptions towards the New ses Fund amounted to 3,694*l.* 6*s.* 6*d.*, including donations from the Worshipful Company of Merchant Taylors, 105*l.*; I. Garbutt, 10*l.* 10*s.*; Mr. A. T. Walmisley, 5*l.* 5*s.*; Mr. Parkes, 2*l.* 2*s.* "A.A. Student" collected 1*l.* 16*s.* 6*d.*, V. E. Hewitt 1*l.* 1*s.*, and Mr. D. A. Forster 1*l.*

R. C. HARRISON TOWNSEND read a paper entitled

## "Originality" in Architectural Design.

deplore the inefficiency of the presentment of to-night's at, the more that I feel it to be quite one of the most tant that you could meet to consider. For it does not se to add to minds perhaps already largely stored er item or series of items of knowledge, but it offers for deration what to do with the sum total of all the learning ave up to now acquired, and will in the future acquire. t suggests the subjection of the isolated facts of learning ynthesis that shall resolve them into one organic whole. eatures on styles, papers on materials, demonstrations on ds, these and the daily experiences of your work, all o fill your minds with the data of certain indispensable ledge. Yet even profiting to the full by these opportuni- and bringing to them even the most unflagging industry he most retentive of memories, you are then face to face the question of how to get the most complete outcome this mental equipment. And the doubt arises whether a of facts and a mass of knowledge are all that go to the ing of an architect. Does the fact that you are—even ously and widely—educated, that you have at your finger- any amount of knowledge of materials and construction, hat you possess a full acquaintance with the historical ins of architecture handed down to us from other days— all this do more than make you ready to be an architect? it, as a matter of fact, constitute you one in the proper of the word? And, unless something breathes these dry rs of knowledge and tradition into life, is their possessor o than a skilful "practitioner"—a thoughtful and cultivated essional man?"

am here by no means raising the tattered banner on which rcribed the wearying question, "Is architecture an art or ession?" I care little whether it be an art or a pro- on, or, for the matter of that, a trade. Whichever we it, however, a man's fitness to be and claim to call himself rchitect are not to be estimated and gauged by the uring-standard of what he has learnt. It is not hat he knows, but by what he does with what he es that he shall be judged. It is for him to throw the crucible of his own nature all his learning and his knowledge, there to be fused and made one, out of that melting-pot to draw an ingot that is to be pped and shaped as his own personality, his own in- ualism shall determine. As Marcus Aurelius says, "Is it grievous thing that an architect shall respect the course ysteries of his profession more than the proper course ondition of his own nature?" That is to say, that too e a regard for that course and those mysteries, or, to put it wise, the attachment of undue importance to formulæ and causes a positive atrophy of the imaginative and creative y, by which an artist—the architect as well as the painter sculptor—should claim to be appraised.

To follow foolish precedents, and wink  
With both our eyes, is easier than to think.

et precedents and traditions must need exist and endure ery art, and it would be presumptuous to claim to be in bsolutely free, and to have shaped oneself rather than to een made by the great thoughts and the great men were of old time before us. There is no logical stand- for him who disclaims and disavows all reference to, all ndence upon, all reverence for the past, and whose ideal e substitution of his own ignorant lawlessness for the ns handed down to him from other times. Such a one, I ine, would, without remonstrance, accept and adopt the "anti-historical" applied the other day in one of our ly papers to express the aims in art of one of those archi- whose views I am trying to put before you to-night, and t not consistently rejoin that he claimed to be individual pression—not original and creative. Nor could he er maintain, as that criticised architect would, that he was t more truly historical and following more closely along nes of architectural evolution than the many mimics of rms into which architects of distant countries, or of ne days, have cast their thoughts and their ideals. ere, let me ask, is there justification for alleging that any,

or, at all events, let me say that any considerable number of architects have in set terms foresworn allegiance to tradition, and have claimed the right to apply the word "original" to their works? I think not. Individual in method of expression, yes; non-resurrectionists of long-since dead and buried styles, yes; haters of mimicry of earlier forms that were expressions of earlier wants and needs, again, yes. I know those who are glad to come under those categories, and I venture to think that in their hands lies the future of our art.

Yet, remember, that in thus doing your best to make your architecture speak To-day rather than the Past, you are not to strive, of set purpose, to be what you or others may call "original." As Lowell says in one of his letters, "When a man aims at originality, he acknowledges himself unoriginal." You will find it both grand ideal and hard task enough to try to let your work reflect you yourself, and to give it a personal and individual character. If it thus bears your own impress, what more "originality" need it have or can it have?

But this quality must come of itself, it must result not from the attempt to do what other men have never yet done, but from your wish to shape your work so because it seems to you the best solution of the problem before you. And, having worked out this—your own—solution you neither adopt nor, on the other hand, repudiate it, because others have arrived at this result before you.

We have in architecture, as I have said above, a speaking living tongue, and if the thick mists of custom and conventions allowed us to see it, nothing can be more illogical than for us of to-day to borrow the language of Byzantium or Florence, or Amsterdam, in which to give our message in this year of grace 1902, or to rely upon a thirteenth or fourteenth-century vocabulary as a means of expressing architecturally our own religious needs and aspirations. While our language, as we now read or speak it, comes to us enriched by that of other days, it yet has the distinct stamp and impress of its time, and to express our wants or tell our tale one to another we do not, in book or conversation, deliberately adopt the spelling or the speech of Chaucer, or of John Florio, or even of Addison.

Yet is not this precisely what we do in architecture? Is not the measure of praise bestowed upon a modern building in exact proportion to the faithfulness with which its designer has worked on the lines of other times, Mediæval, Elizabethan, Georgian or what not; or to the closeness with which he has imitated the architecture of I know not what country, Holland, Italy or France? Is a man ashamed, as he should be, when he is told that his building (his, mind you, finished to-day or yesterday, in 1902, in 1901) is "so faultlessly Elizabethan that it might well be taken for an old building of that date?" Does he feel insulted, as he should, when he is assured that "in general design, as in every detail, his church is conceived and worked out in a thirteenth-century style?"

I know it will here be said that there are less extreme cases than these, and I shall be reminded that there exists that vaguely qualifying phrase, "a free treatment" of such-and-such a style, which is supposed to represent a saving grace, and to oblige us to approve a design which is not, like those others, all copyism, but one with, say, 75 per cent. of imitation and 25 per cent. of "free treatment." This seems to me to be a distinct concession towards the point of view I am speaking of, and even this modicum of freedom is to be welcomed, and we ought to be thankful for, at any rate, such proportions as I have suggested. Yet these might conceivably be reversed if the architect's mental attitude when face to face with a problem of design were different to, and, as I think, more logical than the usual one, and one might then hope to find, let us say, 75 per cent. of spontaneous individual personal feeling in the design, and the 25 per cent. residue, if it did happen to be reminiscent of other and preceding work, would not, at all events, be so because of an avowed desire to recognise closeness to the designs of earlier men as the ideal towards which one should strive.

An architect may (and I am, as I have said before, glad to say he usually does) tone down the rigid exactitude of a sheer copy by more or less admixture of his "free treatment." But how often does he not sit down at his drawing-table with the acknowledged intention of producing a "Gothic design"—a "Renaissance design" (both of them with—or without—that wonderful "free treatment")—or, indeed, as it sometimes happens to-day, a design in which all architectural graces are to be laboriously and effectually omitted altogether? And selecting from a well-stored memory—I refrain from suggesting dependence upon Kodak, or reference to sketch-book—a certain form, or fashion, or style, does he not proceed to clothe his building with the particular material his mental pattern-book suggests, and to rely for his design more upon the achievements of the past than upon his own invention and his own imagination of the present?

I have said more than once he may refer to and ask the past to help him to a solution; he must not depend on it to find him that solution.

In literature, a few years ago, we were all keenly touched

to hear an American critic of much note tell us that "all the tales have been told." He was more wrong than even most makers of epigram, and we felt that while men and women are, and while lives are happy—or are sad, and while hopes are hoped—or frustrated, and while hearts are blithe—or breaking, there are still at each turn, and every moment, tales, comic and tragic, both, unwritten, it is true, but there, and only waiting the writer.

And in our own art, are all the tales exhausted, and are we at best to repeat—in perhaps slightly, very slightly different words—those that our fathers told, with here a change of adjective, and there an added or a diminished emphasis, with this trifling omission, that small addition? Did our tales, ours as architects, stop short a hundred years ago, leaving us tongue-tied and silent, unless we speak a Georgian speech, and talk in the eighteenth-century words of our great-grand-fathers? I do not stop here to ask if even their architectural utterances were the best to which they might have attained, and if they—and their fathers in turn—were not, at most, speaking in a kind of dog-Latin—or dog-Roman rather—more false and unnatural even than the would-be Classic pastorals and eclogues of their literature. That would be to discuss what their aims might and should have been. I am considering what ours of to-day should be.

As their language helps us of to-day to speak, so their architecture is an element in our education; and education should merely fit us for that design for which we too often find it substituted. If, in a given building, we have, for instance, to carry a weight, let us admit that our beam or bressummer need not necessarily be borne by a column modelled, with more or less faithfulness of copy, upon what the Greeks, or the Romans, or the builders of the Middle Ages have done before us. It is our weight, to be carried in our way, and it is for us to think out the problem of how best to make and shape and fashion the column to do our work, not to solve our difficulty by borrowing their method.

Sydney Smith's profane one, who was, like Talleyrand's *père de famille, capable de tout*, and who even went so far as to speak "disparagingly of the equator," was, I imagine, the most orthodox of persons compared with him who, in this room and to this audience, ventures to breathe a doubt as to the supremacy and all but sacred character of the Corinthian column, and whose architectural agnosticism looks with the same unorthodox eye alike upon the "Five Noble Orders of Architecture" and the various "Periods" under which archaeological architects have tried to catalogue Gothic architecture.

Such a profession of want of faith is sure to be met—I have heard it over and over again—by what is supposed to be a crushing *ad hominem* rejoinder. The sceptic is told that till he shall, in the first place, himself produce, or, in the second, shall put forward evidence that it is possible for himself or others to produce a column that shall approach even within measurable distance of the Greek model, it were better that he held his presumptuous tongue, and—like his interlocutor—were content to recognise that the Corinthian order gives architects the best and highest and final expression of the column possible. And, further, that thus recognising it, he should feel happy and grateful for so good a thing to copy. (Of course, by the way, he need not adopt the actual word "copy," but may use the more refined method of expressing the same thing, and refer to it as his "precedent" or "the source of his inspiration.") In answer to which I would urge that, while no art is entirely and absolutely "upon all fours" with another, and admitting that analogy is generally a somewhat specious method of argument, I think it quite a fair and legitimate request to ask you to put to yourselves for a moment this problem of dependence upon the great achievements of the past in the terms of another art. Let us see, for instance, how it looks when presented to us, not as an architectural but as a literary question.

There were great Greek architects—say, for example, Callimachos or Scopas or Ictinos—who wrought with their highest power and skill upon a certain factor in design common to them all—the Corinthian column—and produced examples of this beautiful feature which are recognised as reaching the highest possible point of attainment of which it is capable. They obeyed at the same time all the necessary conditions—their column has base, shaft and capital, it has proportion, it suggests strength where that quality and expression are called for, and elegance where æsthetic claims demand it. The result beautiful beyond question.

Well, let us now, as our parallel in literature, turn to poetry, and taking the sonnet, let us posit for the sake of my illustration that Shakespeare, Wordsworth and Keats have written the finest and most perfect verse, in this particular form, of which our language can boast. And, for the further purposes of my argument, I take these, the three greatest writers of sonnets, as the equivalents in literature to those who created the most perfect productions of Greek architecture. Then, if we regard both these great architects and these great poets from the same logical standpoint, it is no straining of argument

that puts us into the position to paraphrase what we all say to the modern architect, and to cry to the would-be sonnet writer, of to-day, "Hands off! The most supreme sonnet in which you feel your thoughts could mould themselves is for you. Do you forget that through Shakespeare, or Wordsworth, or Keats the greatest sonnet that the world has has already come into being? With perfection thus attained, why ask us to be satisfied with less? Are you then so sumptuous as to offer us your own poor thoughts in your halting words simply because they are yours, and because you feel that only thus can you speak your own message? The best is written, and for you remains at most humbly reverently to offer us more or less imitative variants of great work."

Do not misunderstand me on an important point in connection with this illustration. I am taking the sonnet—a common to all poets—as the parallel to the column in general, a feature common to all architecture. You cannot allege my position is the ridiculous one that because great men used them we ought to abandon the sonnet form in poetry, the column in our own art. My point is that in architecture we copy—whether we call it so or not—what we consider very finest example of the past, calling the result architecture, and it would be but a mere "parity of reasoning" if we in the same way to copy absolutely the most perfect sonnet Shakespeare and to call that result our poetry. It should influence every poet; no poet should copy it. The column Ictinos should influence every architect; no architect should copy it.

Or let us imagine again a poet of the past who has breathed into his verse the fullest and most satisfying expression of mystery and beauty of the dawn, and whose noble lines relate to us in highest degree its very soul and essence. Is, let us ask, the wonderful and supreme beauty of this achievement of former days to silence, as if it were sacrilege, the voice of poets who also hear what nature has to say when another is born? Are they to be told that it is for them presumptuous to try to sing the dawn, and that its spirit and sentiment, charm and beauty have been, once and for all, seized hold of and cast into so perfect a form that it is rank profanation to touch the theme again?

It is only in bricks and stone that we express our wants and ideals by means of borrowed Elizabethan phrases rather than in our vernacular; only in our churches that we imitate the archaism of Chaucer—an "English undefiled" it is true, his of the fourteenth century, not ours of to-day.

No Madonna that, say, Botticelli or Raphael ever painted has daunted a later artist from attempting the subject. Neither their work, nor that of another, whatever be its perfection, be looked upon as being so far the completest sublimation of all that man can say of woman's beauty and mother's love that he must regard that realisation of the subject as so perfect that neither he nor another should dare, without presumption, put forward their own conception of it. Unlike the architect he does not rest content with the low aim of copying that work again and again, with such strict accuracy, or such slight deviations as his nature may suggest, or to which his technical skill be equal.

I am not contending that copyism does not find its way into other arts than ours, but I do urge that at most they copy methods, the technique, the principles of other men and other schools; they do not, like us architects, copy the actual work. Our only invention is in the rearrangement of other men's thoughts; our only thought how to redispose other men's inventions. And even if in some degree imitation and copying exist in the other arts, ours is the only one based upon it.

We do not and we will not call it copyism or imitation, we use a hundred and one qualifying expressions to soften down those words. We talk of our "precedent," our "source of inspiration," of the "freedom with which such-and-such a style has been treated," of the "fresh and clever way in which the architect has dealt with his limitations of style," and so on and so on. But all these phrases do is to express that the work is not a strict copy, that it is but in part imitation, that the pretence is dropped at times and it is not all mimicry. They do but mean that, here and there, the architect is tempted to think for himself. As a matter of fact, these occasional lapses into heterodoxy are regarded with a good deal of suspicion natural to the orthodox, and the regular practitioners are pained and shocked at any departure from the recognised and traditional formulæ which they themselves have christened architecture.

Yet, for myself, I welcome these lapses, and would fain see them more frequent and their scope wider, till at length the "free treatment" spread over the whole building.

You will remember that I spoke above of designs which were so far daring as to show a quarter of individual and spontaneous thought, as compared with three-quarters dependence upon recognised style. I advocate no impossibility or unattainable ideal when I plead for at least a reversal of those proportions, and that your work shall show

your own personal thought and individual ideas as by far the larger element in the design. Approach your problem with all your education and your knowledge at your back, but with the intention to compel that education and knowledge to work your will, and not to submit to their leading you away their captive and their slave. Face your design—your plan or elevation or tower or door or cornice—as your own work which you must do in your own way, resolving to infuse it with the qualities you feel it ought to possess to represent you, and not with those that memory points out as being necessary to some selected style.

I am no despiser and contemner of that accumulated experience we call tradition, and in asking for our release as architects from the necessity to conform to the styles of other days and countries, I recognise as much as anyone the need of education, and that acquaintance with the highest achievements of other men that best fits us to express ourselves also to our best. As Sidney Lanier puts it, "Once for all, in art to be free is not to be independent of any form; it is to be master of many forms."

I am not asking you, as I said before, to try to be original," but I am begging you not to copy. And to start intending to shape an architectural design upon the lines of any style must of necessity imply copyism on a greater or less scale.

It is in placing individualism, fully equipped by education, before stylism that one sees the possibility of architecture becoming once more a speaking tongue, by the means of which man's wants and ideals of to-day shall be clothed in the outward shape those wants and ideals ask, and not in the worn-out trappings of the past or the mouldered ceremonies of men for ever dead.

Let me conclude with one of E. Wharton's apologies:—

"There was once a man who had seen the Parthenon, and he wished to build his god a temple like it.

"But he was not a skilful man, and, try as he would, he could only produce a mud hut thatched with straw. And he sat down and wept because he could not build a temple for his god.

"But one who passed by said to him, 'There are two worse lights than yours. One is to have no god; the other is to build a mud hut and mistake it for the Parthenon.'

To which I add this as rider:—"Nay," said another passer-by, "You would have built a better temple to your god ad you had an ideal of your own, and so no need to copy—even the Parthenon."

Mr. H. T. HARE, who proposed a vote of thanks for the paper, said he agreed with Mr. Townsend that mere copyism in art must be demoralising. The development of architecture as a matter of generations. Schools arose and declined, and each school depended upon those that had gone before. He was therefore inclined to think that the Victorian age would not be regarded as one of mere copyism, as it seemed to be to-day. All architecture was based upon tradition, and in every generation the majority of men had only mediocre capacity. The translation of their studies into work could produce more or less mere copyism of the work that they had studied. But there would always be some men who would produce architecture which would have individuality and originality in it which would pass beyond mere copyism. Every architect had not the power to express original ideas, and it seemed safer for the majority of men to work on traditional lines rather than try to strike out a style for themselves.

Mr. F. G. HOOPER seconded the vote, supported by Mr. F. ISHMAN and Mr. ALEXANDER WOOD.

It was announced that at the next meeting on February 14 paper would be read by Miss Ethel M. Charles, A.R.I.B.A., entitled, "A Plea for Women Practising Architecture."

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. John Slater, vice-president, in the chair.

The decease was announced of the late Mr. W. Green, of York.

The following were elected as Fellows:—Messrs. John Parker, A. N. Prentice, J. R. Moore-Smith and F. H. Tulloch.

As Associates:—Messrs. C. T. Adshead, S. W. Bensted,

G. Besant, A. B. Botterill, C. A. Broadhead, D. J. Brundrit,

Busbridge, R. S. Cockrill, W. J. Devlin, W. E. Dobson,

Ewing, E. L. Gaunt, A. E. Gibbins, F. R. Boyd Haward,

E. Hemingway, A. E. Hughes, A. T. Hussell, E. W. Lees,

B. Norris, L. R. Oakes, H. F. Ponton, C. E. Power, W. B.

ees, C. H. Reilly (M.A.), E. G. Rodway, Andrew Sharp,

L. T. Sharp, W. Slater, F. D. Smith, W. S. Tucker, A. H.

erststage, E. P. Wheeler, J. A. Woore and E. L. Wratten.

The Chairman announced that the Council of the Institute proposed to submit to His Majesty the King the name of Mr. J. F. Bentley, the architect of the Westminster Cathedral, as a fit recipient of the Royal Gold Medal, 1902, for his work as an architect.

Mr. JOHN SLATER read the following

### Address to Students.

The architectural student of to-day, if he takes an intelligent interest in the history of his art, must be much impressed and somewhat puzzled to notice how very fluctuating and short-lived have been the various fashions of architectural taste during the last hundred years or so. If he looks to ancient times, when the world was young, and what Lord Leighton calls "the spirit of spontaneous, unquestioning joy in production" was paramount, this was not the case. The styles of architecture which the early building peoples evolved for themselves to suit the vicissitudes of climate, the varying necessities of their public and private life, the nature of the building materials found in the country, and various other local conditions—whether you turn to Egypt with its colossal and gloomy avenues of sphinxes and columns, or to Assyria with its glazed tile decorations and mural tablets depicting in realistic fashion all the daily occupations of its kings, or to Persia with its lofty tapering columns and pillared halls such as we see at Persepolis—these styles, I say, persisted with slight variations for centuries, and only died with the decay of the nations themselves. When we come to Greece, we know that at the beginning of the sixth century B.C. the splendid temples of Artemis at Ephesus, and of Heré at Samos, were commenced, and we can only imagine what a length of time must have elapsed from the erection of the earlier and simpler Doric temples before these two magnificent buildings could have been possible. The Doric and the Ionic styles flourished contemporaneously, and the latter merged into the Corinthian, the earliest example of which is the Choric monument of Lysicrates, which was built in B.C. 335. When the Greeks began to plant colonies along the Italian littoral, numerous temples sprang up there, and the Romans became familiar with Greek architecture, which they naturally adopted, with modifications and variations, and this variant of the Classic style prevailed during the continuance of the Roman Republic and under the emperors, not only in Rome itself, but in the numerous colonies which she founded, and the ruins of the Roman edifices served as the pattern for the debased Classic buildings which were erected during the earlier centuries of the Christian era. Passing through the Romanesque, we find Pointed or Gothic architecture fully developed in England and on the Continent, except in Italy, where the Classic traditions lingered longest, by the end of the twelfth or the beginning of the thirteenth century, and from then down to the middle of the sixteenth century this style with its developments and modifications held the field until the revival of letters led to that renaissance of Classic taste which stamped its mark on the architecture, the literature and the painting of the next 200 years. Since then all has been changed. In 1830 Quatremère de Quincy published his work on the lives of the most celebrated architects, and he uses these words in his introduction, "As we only recognise as the true architectural art that which—alone among all known methods of building—owes its origin, its progress, its principles, its laws, its theory and its practice to the Greeks, and which, handed on by the Romans, has become that of the greater part of the civilised world, we must forewarn our readers that no mention will be found in our treatise of any work or of any architect of the kind called Gothic."

In 1827 was published a work illustrating the recent buildings erected in Regent Street, and on the outskirts of Regent's Park, and speaking in terms of no unstinted praise of the excellence of the designs. Yet in 1836, when the Houses of Parliament were in course of erection, we find the Gothic style to the fore. In 1867 the competitive designs for the new Law Courts were sent in to the number of eleven. Every one of these—except one alternative design submitted by Mr. Garland—was in the Gothic style, and Mr. (afterwards Sir) Gilbert Scott in his report claimed for the Gothic style that it afforded the greatest facilities for the developments suggested by modern requirements, modern materials and modern modes of construction. A generation later what do we find? You are all of you acquainted with the storm which was raised a few weeks ago against the Liverpool Cathedral competition, and I need not quote the opinion of a distinguished modern architect as to the competency of the Gothic style to meet the requirements of to-day. Now I think it very probable that all this may lead an architectural student to exclaim:—"A plague on both your houses. Why should I bother my head with learning anything about Classic or Gothic, Romanesque or Renaissance? All art is ephemeral, utilitarianism is the only guide. These styles are now all dead, and will give me no help towards designing a town hall, an infirmary, or a modern

residence." Now I do not think it can be too strongly impressed on those who may be disposed to hold such views that they will be utterly wrong if they take this line. What is it that stirs the emotions even of the unlettered man when he gazes down a vista of columns, gigantic and awe-inspiring, in an old Egyptian temple, or looks upon the perfect grace of the Parthenon, or the stupendous relics of mighty Rome, until, as Byron says,

the place  
Becomes religion, and the heart runs o'er  
With silent worship of the great of old ;

or when in some old Mediæval cathedral, where

The blessed saints are smiling dumb  
From the rich painted windows of the choir  
On aisle and transept,

he looks up to the springing arches and intricate ribbed vaulting—what I say, stirs the emotions, but the feeling that, different as may be the forms which present themselves, there is such fitness in the purposes of each and in the connections of all the parts with each other, such perfection in the combination of form and colour that the net result in every case is beauty? And if this emotion is excited in the untutored breast, even though it may fail to find expression, is it not more so in that of the artist, and ought he not to study reverently and carefully the older styles, not with the idea of slavishly imitating them, but with the desire to enter into their spirit, to see what were the aims with which the old masters of the building craft worked, and upon what the beauty of the result depends? The buildings which have attracted and which will attract the most universal admiration are not those at the sight of which we exclaim "How enormous" or "How wonderfully clever," but those which are beautiful; and whenever you meet with a building, large or small, new or old, which attracts you as being beautiful, study it carefully, not in the mechanical spirit of the anatomist who is dissecting a dead body, but with wise and loving sympathy and reverent tenderness. I am old-fashioned enough to think that an architect ought to try to make his building beautiful, and that a protest should be made against what appears to me to be the cult of ugliness which has been growing of late years. There is too great a tendency nowadays to mere eccentricity and originality among the younger men. There have been several buildings erected lately the cleverness—I had almost said the infernal cleverness—of which cannot be denied for one moment, but are they beautiful? There is far too much straining after effect, too great eagerness to achieve something not attempted, or at any rate, not achieved before; and, as has been well said, "When the achievement becomes obvious, is it not by way of becoming uninteresting?" I am not arguing in favour of a dead level of monotony which is uninteresting, even if the level be a high one; I have no love for the stereotyped style of art which the continental methods of education and study too often result in. If a man be a true artist his individual emotions, the bent of his mind, all the idiosyncrasies of his character are bound to come out in his work; but do not let your main idea and aim be to display your idiosyncrasies. In this connection I cannot do better than quote some words recently used by Sir Edward Poynter in addressing the students of the Academy. He said:—"The desire to be original is a constant besetment of the young artist, but unless founded on a solid base of knowledge and study it is apt to lead to mere eccentricity, and to show a desire to astonish rather than to command that legitimate admiration which sensible people would give to all well-considered and thoughtful work; and there is perhaps nothing more distressing to the intelligent observer of a work of art than an evidence of the desire to be original at all costs, where there is neither genius nor knowledge to support it." These words cannot be too closely pondered on and taken to heart by every artist, and especially by architects to-day, who are too apt to think that the rays which fall from the new electric lamp of eccentricity have extinguished all the beams of the old seven lamps. A real genius may be original because he has the knowledge and the power to work out his original ideas, but what can be more contemptible than to see the weak jejune and spiritless attempts to copy what may be admired as an original work of genius, while the copy only shows the lack of genius in its exponent? In literature we admire Carlyle because of the intense earnestness which is everywhere to be found behind the rough and somewhat uncouth language which he employs; but of those who have tried to imitate Carlyle what shall we say? "Non ragioniam di lor, ma guarda e passa." Your buildings are the vernacular in which you have to express the architectural ideas which are in you, and depend upon it the simpler and more direct that language is, the more eloquently will it appeal to the world. Be assured, therefore, that the time you may spend in studying old work will never be wasted, that such study will but brace your pinions and fit you better to soar into the heights which science is opening out for you. And further, the study of old

work will teach you another most important lesson—never lose sight of the nature of the material in which you are working. In the best old work the material is never tortured: one for ornamentation and enrichment is suitable for stone, another for brick, and another for wood; and this has always been the sight of when art became debased, with the result that a *tour de force* is attained from which, however much we admire the skill which produced it, we turn with relief to simpler, truer and more legitimate methods of treatment.

Before I leave the subject of what I may call your intellectual equipment for the career which you have chosen, let me urge you to cultivate an easy, terse and literary style. When you get into practice you will have to write reports and to carry on daily correspondence of all sorts of subjects, and you should endeavour always to make your own meaning as clear as possible to those whom you are addressing. It often occurs to me how lamentably deficient in literary style are the majority of letters which one gets from architects. And here I cannot but express my regret, which is shared, I believe, by all members of the Council, that we have been unable to award the Poynter prize this year. Here is an opportunity, which I should like to see more widely embraced, of carefully studying some subject given to you, digesting it, and then producing in your own words a dissertation on the subject, which should not be a mere *réchauffé* of what you have read, but an attempt to explain to reason upon the theme which has been set you. I hope next year we shall get a much larger number of competitors for the prize. Also I would urge the younger members of this Institute not to neglect any opportunities you may have to practice public speaking. If any subject is treated in this room which you have knowledge, I am confident your attempt to impart it will always be received sympathetically by the members of this chair, whoever he may be, and you will find it an enormous advantage to be able to express your ideas in public. I very much wish more of the younger men would take part in our discussions here. When you once get started in independent practice there will be hosts of matters coming before you on which you will only have your own judgment to guide you. You are sure to make some mistakes, but do not be unduly discouraged by them; you will learn more from your mistakes than in any other way. I must just say one word on the vexed question ever since I took any interest in the Institute—I mean competitions. Whatever may be my personal views on competitions, I do not for one moment suppose we shall ever get rid of them. From the point of view of the promoters, I do not think the best method of getting the most suitable design is by competition, because, however fully you may draw your conditions, you can never embody them all the small points which ought to be and would be considered by the designer if he were in constant touch with those whose requirements he is trying to meet; but from the competitor's point of view—painful as must be the aggregate waste of time and energy—it seems to me that it was a great deal of force in the remarks made by Mr. Wills a few weeks ago in this room. He said that a man starting in practice cannot possibly have his time fully occupied, and that he had better waste his time going in for competitions than in other ways, there is no doubt you may learn a great deal by endeavouring to work out actual problems of design; but you ought to work them out conscientiously, and not slur over difficulties, or you will be apt to get into slovenly ways of work, and there is always the danger of being led to telling bits of design into the elevations without looking at the construction. And if you do go in for competitions, when the award is made I cannot help thinking the losers would best consult their own dignity by accepting their defeat in silence. Of course, I am assuming a conscientious assessor and promoters who mean loyally to accept his award. Words can be too strong to stigmatise cases in which assessments are upset for no intelligible reason except nepotism; but I hope such cases are growing rarer, and the Institute is, I feel sure, always desirous of doing its best to keep competitions clean, fair, and above board.

The field of an architect's practice is ever widening, and in fact, it is now so extensive as almost to deter men from entering on it. All the new discoveries of science, which at first were simply laboratory experiments, are gradually made to subserve our daily needs and requirements, and as soon as this is taken place our clients expect us to advise them with reference to all new inventions, and you will find it to your great advantage to keep *au courant* with the times by noting and, if possible, investigating the utility of new inventions affecting architecture. But the powers of any individual are limited, and I feel sure that the near future will see a good deal of dilution of the manifold duties undertaken by architects. I see no reason why this should turn out to the detriment of the architect. On the art side he can be associated with the sculptor, the painter and the mosaic worker, and on the scientific side why not with the engineer? Quite recently

stitute urged the desirability of associating an architect with an engineer in bridge design, and I am confident it would be desirable to associate a professional civil engineer with an architect in the case of large buildings where difficult problems of support or construction have to be considered, the best arrangement of electric wiring, and so forth. I would be the last to undervalue the great assistance which an architect receives from what I may call the specialist manufacturers with whom we so frequently have to consult, but personally I am disposed to think the better plan would be to put their work under the direct supervision of a professional engineer, who could draw up the specification embodying the conditions under which the work is to be carried out. But this is a question which scarcely comes within the limits of an address to students. The very wideness of the field covered by an architect's practice, with all its manifold responsibilities, has, however, its compensations. As your practice increases you need never be haunted by the dread of monotony. Your work will probably take you afield into various parts of the country, and every fresh building which you have to design will present new difficulties as to site, aspect, accommodation, &c., which it is a never-ending pleasure to try to overcome. Architecture is so many-faceted, and touches so many planes of modern life—ecclesiastical, municipal, commercial and social—that an architect ought above all other men to be broad-minded and to avoid anything like cliqueism or a haughty bearing towards his fellows. Remember that, however fascinating and lofty may be your designs, the effect of your building when finished depends not upon yourself, but upon the builder who carries out your designs, the foreman who looks after the work, and even the individual carpenter who fits a moulding or the labourer who mixes the concrete, and if you cultivate broad sympathies you will find all through your life that you will remain a student and will be learning lessons every day, and this will tend to keep your brain clear and your mind receptive.

In these few remarks I have endeavoured merely to touch upon some of the matters of interest to students as to which word of advice or caution may be useful, but you must fill in the details yourselves, always remembering that so honourable and inspiring a profession demands that those who practise it should always uphold a high standard of honour among themselves.

In conclusion, let me heartily congratulate those of you who have come here to-night to receive the prizes which you have so thoroughly deserved. Mr. Hare will give you some detailed criticisms on the work which has been submitted, and I will only say that I think the collection of drawings which has been on view the last fortnight is a really remarkable one, and shows an aggregate of labour, study and skill which cannot be too highly commended. And you who have not been fortunate enough to win prizes are also to be congratulated, for you have shown a steady perseverance in working out your designs which will certainly not turn out to be lost labour, and you will learn a great deal by observing how others have got over the difficulties which perplexed you. Do not be unduly depressed by your failures nor elated by your successes, but let each only stimulate you to further endeavours. I heartily wish you all possible success in your future careers.

Mr. H. T. HARE gave his

#### Review of Work Submitted for the Prizes and Studentships, 1901.

He said:—One cannot, in looking round the exhibition, fail to be struck by the vast amount of care and labour which the students who are competing have expended on their work, and it behoves the critic to weigh well his words that he may not in the one hand omit any beneficial criticism, or on the other discourage or misunderstand an earnest and meritorious worker. It is also to be borne in mind that the designs are the work of students and must not therefore be judged with so great severity from a practical standpoint. With these considerations before me, and remembering the many brilliant men who in former years have occupied my present position, I approach my task with some trepidation; being conscious that, though I have been accustomed to form opinions on the works submitted for these prizes, I have not hitherto had occasion to formulate those ideas in such a manner as shall make them intelligible to others.

The subjects included in the prize list of the Institute cover a very wide field, ranging from the literary side, as instanced by the essay, to the eminently practical, as evidenced by the Grissell medal. The study of old work is encouraged in the competitions for the Pugin studentship and the Institute medal, of colour in that for the Owen Jones prize; while design, the ultimate end and aim of all these studies, is avoided in the subjects given for the Soane medallion and the Tite prize. Any student who had taken, year by year, one of these subjects would, I venture to think, when the list was exhausted, have passed through a course of study which would be of infinite value to him in after years, and would

equip him with a fund of knowledge which would stand him in good stead in the stress of practice, when little time or opportunity is left for theoretical study. The standard of work submitted has always been a high one, the prize designs and drawings usually being among the most notable published during the year, and this occasion forms no exception. Except in one or two particulars, I think the work may bear comparison with the best of former years; indeed, some of it seems to me to be a step in advance.

I will take what is usually considered the most popular competition first in order. I refer to the Soane medallion. The subject given, a large public swimming-bath, with two or three accessory rooms, has attracted sixteen competitors. Although this is a rather less number than last year, it may be considered a satisfactory response, and it is gratifying to be able to say that the quality of many of the designs is much higher. Last year the Council felt compelled to withhold the medal, a course which must always be reluctantly taken; but this year there are several designs, any one of which might have received the award. The site given being an open one, untrammelled by any restrictions, it is curious to note that out of the sixteen competitors no fewer than twelve should have preferred to arrange their main frontage and entrance at one end, the remaining four only utilising the side, the length of which I should have thought would offer the most architectural possibilities. The end frontage and entrance have tempted many competitors to duplicate the accessory rooms asked for in order to balance the grouping, a license which was hardly contemplated and is barely legitimate. It is never intended that the schedule of accommodation should be strictly and rigidly adhered to, but it should not be necessary to materially vary it in order to produce a satisfactory design. These remarks apply with the greatest force to the prize design, that submitted by Mr. Fulton under the motto "Iona"; indeed, to such an extent has he exceeded the prescribed limits, that the selection of his design was seriously jeopardised on this ground alone, and it is only owing to its undoubted superiority in other respects that it receives the award. This design is an extremely fine one from the architectural point of view, exhaustively thought out in every detail, brilliant in draughtsmanship, and though a little wanting in some respects in reticence and inclined to be overdone, still, taken all in all, a masterly composition reflecting the greatest credit on its author. Two designs receive medals of merit, those by Mr. Moodie ("Tepidarium") and Mr. Detmar ("Balneum"), both of which are very excellent sets. Of the two I prefer the former, the management of the plan with the two enclosed courtyards being extremely satisfactory. The interior is also well designed with an evident appreciation of architectural effect. In Mr. Detmar's design the planning of the octagon hall cutting into the bath appears awkward and the reason obscure. There is a touch of genius, however, in the open arch, with group of statuary between the hall and bath. "Io" (Mr. Vincent Harris) receives honourable mention, and is a clever set of drawings. The interior of the bath, however, though well-designed generally, appears to be insufficiently lighted. There are several other designs which may be examined without uneasiness, but it is impossible to particularise all that are worthy of note. I may, however, mention "Amphibious," a clever design of Spanish character, "Silhouette" with a wonderful coloured interior view, and "Roma." Several competitors do not appear to have realised that the treatment was intended to be architectural, and have regarded the problem as one to be solved by engineering rather than architecture, a mistake which ought not to be possible, for the one should comprise and be necessary to the other. Few of the authors have successfully grappled with the difficulty of the dressing-boxes, which ought not to have been impossible of treatment if not regarded from a too practical standpoint. The chimney-stack has also proved a serious stumbling-block, and not a single author has attempted the solution by twin towers, which in a Classical or Renaissance design would, I think, have been a legitimate treatment. It is also difficult to see why so few of the best designs have introduced lighting from the roof, which is almost an essential in a swimming bath, and is surely not beyond the wit of man to compass without much sacrifice of appearance. One notices with some interest that the most successful designs are those which have drawn their inspiration from the Baths of Caracalla, a motive which bids fair to prove a sort of universal recipe for many of our problems, from a cathedral downwards, and one is fain to admit that a worse model might have been selected.

The drawings for the Tite prize are this year disappointing, as, though the number of designs submitted is large, there is no single one among them which unmistakably excels; indeed, I may say that there is not one which can be regarded as quite satisfactory. The subject, a Royal Mausoleum, is a purely architectural one, calling for the highest development of the art, and the conditions supplied a plan which was one of Palladio's unworked-out sketches. Competitors were thus at

liberty to devote the whole of their thought and study to the architectural treatment of the subject, and it was fully expected that at least one or two very fine designs would have been elicited, especially as so much attention is at present being devoted to Italian architecture. I should here like to explain that the Tite Bequest was made with a view to promoting the study of Italian architecture, and by that time should be understood the architecture of Palladio and his contemporaries and followers. This does not appear to be clearly realised by many of the competitors, and year by year the Council are compelled to pass over a number of very excellent designs because they did not fulfil this essential condition. The design which receives the award this year, "Lion Heart," by Mr. C. Gascoyne, may be said to owe its position rather to negative than positive merit. While it fails in dignity and impressiveness, it is the design against which the fewest objections can be urged on a careful examination of its details. The dome cannot, however, be said to be strictly Italian, and its outline is not very pleasing, and the entrance portico or porch is open to criticism for the manner in which the columns are introduced on each side of a narrow rusticated pile. The drawings are well thought out, and the design of the interior is satisfactory. "In Memoriam," by Mr. Andrew Nutton, receives a medal of merit, and is the most striking design submitted, the perspective being decidedly powerful. There is a great deal of very clever work in this set of drawings, but the dome and ovum are disproportionate to the substructure, and the entire composition is overpowered and crushed. The author has evidently considered that light is not essential in the interior of such a building, and the central space under his dome would be gloomy in the extreme. Three designs receive honourable mention—those submitted by "Marble," "Shamrock" and "Rex." These, while being excellent in some particulars, all fail in some important respects. "Marble" has a well-proportioned exterior, though the architecture is not quite Palladian. The interior is, however, not up to the standard of the exterior, and is in many respects weak in design. "Shamrock" has the best interior of the series, but the introduction of rustication internally may be questioned. The exterior does not appear to have been sufficiently studied in its proportions, resulting in a somewhat clumsy outline; and although in this competition one does not look too critically into questions of construction, I may be permitted to point out that no effort of engineering could ever induce the dome to stand as shown in the section. "Rex" has a well-executed set of drawings illustrating a design of good and pleasing proportions. The introduction of the two towers or campanili in such close proximity to the dome cannot be considered a satisfactory composition. The dome and other portions of the building are reminiscent of St. Paul's, but the details are weak, and the whole somewhat lacking in vigour and originality. There are several other designs worthy of note, but which time prevents me from mentioning more particularly. It is curious to observe in looking round the designs how many, which are in other respects clever and meritorious, have failed in their general proportions, the tendency being to exaggerate the size of the dome and ovum. This is specially noticeable in the case of "Gibbs," which but for this fault would have occupied a high place in the competition. Many of the authors have drawn upon the buttresses and other features of Sta Maria delle Salute—a rather dangerous source of inspiration, in spite of its extreme picturesqueness in its own particular position. The Grissell medal has this year attracted six competitors, the design being for the roof over a picture gallery. The competition being for construction only, one does not necessarily look for exceptional merit in an artistic sense. It is, however, interesting to find that the best design constructionally is generally also the best artistically, which tends to show that the practical mind can sometimes descend to consider the pleasing of the eye. Or should I reverse the remark? Of the six designs two only have adopted what is generally accepted as the most satisfactory method of lighting; that is, by continuous skylights along each side, leaving the central portion solid—a rather difficult method to treat successfully. The selected design, by Mr. L. W. Grace, is shown in a set of careful drawings, which would no doubt result satisfactorily in execution. I did not, however, notice any complete drawing of one of the roof trusses, which seems a rather serious omission. Nearly all the other designs are worthy of notice, though one or two have manufactured difficulties in order to surmount them, not always with conspicuous success. It is hard to imagine why "Groined Barrel" should have made his roof of elliptical section, both inside and out, in solid concrete. Surely a slope on the outer surface would have been much simpler and easier to construct and to cover. Or, again, why "Fleur-de-Lys" should have used an inner and outer roof principal, both entirely independent of each other. On the whole, however, all the designs reach a high level of merit.

Turning now to those competitions which do not involve

design, but which are devoted to the study of old buildings, I am pleased to note that excellent work is again submitted by all competitors. There is evidence of an amount of enthusiasm and love of their art which leads us to look forward hopefully to the future at the hands of those who will shortly be engaged upon active practice.

Twelve competitors have entered for the Pugin scholarship, the award being made in favour of Mr. Wontner, who sends an admirable series of sketches and water-colours. The subjects treated are of a comprehensive nature, embracing both Renaissance and Gothic work in England and on the Continent. Mr. A. Muir receives a prize of 5*l.* 5*s.* and Mr. J. Gibbons honourable mention. All these drawings are of a high standard of merit that it is difficult to particularise.

The competition for the silver medal is one of the most valuable of the series, in that it insures the careful measurement and delineation of interesting old buildings, thus forming a permanent record which may become of great importance in the future, when the originals shall have succumbed to the hands of the vandal or the ravages of time. For the student, too, there is no work which can give so thorough an insight into the details and methods of the masters of the past as the actual measuring and plotting of the buildings. Sketching is good, but measuring is better. Twelve sets of drawings were submitted, all more or less good, and all of great interest—certainly worthy of much more study than I was able to give them. The medal goes to Mr. Gregory, who has an excellent monograph of Bolsover Castle. Mr. Wynn Owen and Mr. Stanley Towse receive 5*l.* 5*s.* for drawings of Lindisfarne Abbey and Houghton respectively. Among other drawings I note a very interesting study of Emmanuel College Chapel, which is certainly one of the most charming buildings in Cambridge, and which I can remember to have seen illustrated before. I trust that these drawings will receive publication in some form.

The interest in the Owen Jones studentship is fully maintained this year, and it is pleasant to recognise that so many of those competitors who have been unsuccessful in former years now come forward with better results. The standard of the work is a high one, most of the drawings being admirably executed and showing considerable mastery over the brush. While the colouring is not in some cases formed rather by a desire to produce a pictorial than a truthful effect is open to serious question. I suppose colour is a thing which no two people see alike. I am also struck by the fact that the large majority of the studies are of mosaic, Della Robbia and kindred materials, that there are practically no drawings of painted decorations, which would probably be of much more practical service. A vast amount of labour has been expended in showing minute details of each separate tessera of a floor or roof, and while one can but admire the patience and care devoted to the work, it is impossible to avoid a feeling that some of this energy might have been better employed. Seven sets of studies have been submitted, the studentship being secured by Mr. G. N. Bennett, while Mr. Percy Nobbs receives 10*l.* 10*s.*, and Mr. McLachlan 5*l.* 5*s.*, all of whom are to be congratulated on their work.

The essay is for some reason never a very popular competition, and this year only four were received. The subject was "The employment of the Order in Renaissance and Modern Architecture," a theme which at the present moment should be an attractive and inspiring one. It is unfortunate, however, that it has not proved the case, and more unfortunately still, that none of those submitted should be of sufficient excellence to merit the award of the medal. That submitted under the motto "Serlio," Mr. J. J. Waddell, has, however, been awarded a prize of 10*l.* 10*s.* With the essay my task is finished, and I have only in conclusion to thank you for having listened patiently to my perhaps too lengthy remarks. To those students who have been successful I would say: "Regard this as but one step on the long road you are travelling. You have achieved something. There still remains much more than you will ever accomplish." To those who have not been awarded the spoils of victory:—"There is no discouragement. The fact of having prepared these studies, and of having seen how others have attacked the problem, places you in an infinitely better position for the future, and should serve as an incentive to yet another effort."

The Chairman then distributed the prizes.

Sir L. Alma-Tadema, R.A., moved a vote of thanks to John Slater and Mr. Hare.

Mr. J. Burnet, of Glasgow, seconded the motion.

A site has now been purchased from Viscount Portman for St. Cyprian's Church, Dorset Square, N.W., a condition of sale being that the church is built and ready for consecration by June 1, 1904. The architect is Mr. J. N. Comper, of the firm of Messrs. Bucknall & Comper. An appeal was first made thirty-seven years ago to build the church, but it was impossible to obtain a site until recently, when the leases expired.

### THE LIVERPOOL CATHEDRAL SITE.

THE following statement of the arguments in favour of the adopted site, St. James's Mount, has been issued by the committee of the Liverpool Cathedral:—

#### *Public Decision.*

At a public meeting held in the Liverpool Town Hall on June 17, 1901, the Lord Mayor, presiding at the opening until the election of the Earl of Derby as chairman, the St. James's Mount site, which had been recommended by the Lord Bishop's committee after prolonged and careful consideration of Monument Place and all other available sites, and with the assistance of the most able professional advice, was determined on by an overwhelming majority.

#### *Criticism.*

There has been, however, as is only natural in the case of a great and important undertaking, much criticism, and in certain quarters a good deal of opposition, since the St. James's site has been definitely and finally decided on.

Criticism, when duly accredited and thoroughly competent, should be welcomed as a valuable aid to progress, nor can a fair and openly-conducted opposition be productive of anything but good. But it is only right that both sides of a case should be heard, and heard fully and impartially.

#### *Objections to St. James's Mount.*

It has been objected to the St. James's Mount site that it is neither (1) central, nor (2) accessible, nor (3) commandingly prominent, and (4) that it has no vistas; (5) that its occupation would interfere with a public recreation ground; and (6) that it would practically mean a contribution by the ratepayers to the cost of the cathedral.

#### *Its Advantages Maintained.*

The committee hold that each of these six statements rests on an entire misconception, and has no valid foundation whatever; and that the advantages are distinctly on the side of the St. James's Mount site; and further they maintain that this site (7) is exceptionally suitable owing to its freedom from noise, (8) that it is spacious, (9) that the foundations are quite satisfactory, and (10) that it affords a unique architectural position which renders it on its own merits, and apart from all question of cost, a finer site than that at Monument Place. On these points the committee's conviction may be stated as follows:—

1. The St. James's Mount site cannot be reasonably considered otherwise than central, and will become more and more so as the years go on. As a matter of fact, the sites are both fairly central, and there is only a distance of 1,233 yards between them.

2. It is accessible. Tramcars run already on three sides, and on two of these the distance is about 160 yards, which is quite near enough. The site is only 500 yards from St. James's Station; practically as near to the Central Station, Exchange Station and the Pierhead as the Monument Place site; and only 600 yards further away from Lime Street Station. It is therefore, quite easy of access from all parts of the diocese of Liverpool.

3. It is prominent. St. James's Mount has the advantage of being some 24 feet higher than Monument Place. The cathedral would, therefore, be much more commandingly prominent than if built on Monument Place. A cathedral built on St. James's Mount could be viewed locally from a distance of the north and east sides of 200 yards, on the south and south-east of 300 yards, and on the west from an average distance of about 33 yards. Moreover, the Mount, as the Dean of Ely reminds us, "was originally the crest of one of the sandstone ridges which form the background of the sloping hill on which Liverpool is built, and it still remains a lofty eminence on which, as seen from the river—and that is the place from which the most characteristic view of the city must always be visible—the mass of a cathedral building, with its towers and spires and lantern flèche, and the long line of the roof would stand up grandly, giving dignity and distinction to the already picturesque skyline of the city." The Monument Place site can claim no such commanding views.

Nor is it without vistas. Indeed in this respect it compares favourably with the Monument Place site. Mr. J. A. Drisdale Scott, himself an eminent architect, and nephew of the late Sir Gilbert Scott, says:—"The site in itself is a particularly fine one, and one which any architect would take delight in dealing with. It is very peculiar, as the plateau stands some 15 feet above the flanking road. This would give a splendid effect to the principal façade, which would have a wide open space about 500 feet in depth leading up to it. . . . This site, like the other, is very high, and the cathedral would be well seen from the river and other more distant points." At Monument Place the greatest distance that the west end could be seen from would be the corner of Commutation Row and London Road, a distance of 470 yards. On the other three sides the cathedral would be facing on to London Road, Pembroke Place and a proposed new street, which would each be only 20 yards wide, and even if the cathedral were set back

another 20 yards, the view would only be across a space of 40 yards wide, compared with the vista of some hundreds of yards at the St. James's Mount site.

#### *Public Rights Respected.*

With regard to the question of interference with public ground, it should be remembered that by no means the whole of the site is a recreation ground. There are six houses and two cottages upon the Mount which are leasehold from the Liverpool Corporation, and these houses, with the gardens attached, and the back road belonging thereto, extend for a distance from north to south of 500 feet. These houses it is proposed to buy from the Corporation and present leaseholders. The only rights the public have over this part of the Mount are confined to the length of a space called St. James's Walk, which is 20 feet wide. Very little of the space now allotted to the public as a recreation ground will be required for the cathedral.

#### *Contributions by Ratepayers.*

Furthermore, the St. James's Mount site has cost the ratepayers of Liverpool for land and all improvements, such as laying it out, walks, railings, &c., a little over 10,000*l.* And as the cathedral committee have offered this sum to the Corporation for the site, the ratepayers of Liverpool will not be contributing to the cost of the cathedral, and, moreover, will probably for all time to come still have the benefit of nearly the whole open space of St. James's Gardens.

#### *Devotional Requirements.*

The arguments in favour of the Monument Place site are in the main precisely those which might be employed in the case of a building designed for purely secular purposes. Such arguments, even if they were in themselves convincing, which is very far from being the case, would still take no account of the devotional requirements which are of the first importance in a place of worship. The ideal cathedral site should be central, accessible and prominent, and yet at the same time should stand a little apart from the noise and din of heavy traffic.

The Monument Place site is anything but a quiet spot. The roar of traffic is continuous. Electric cars, on Sundays and weekdays alike, run past it on the two longest sides, and the noise and clamour (as is now the case in the cathedral church of St. Peter) would, in spite of the greater thickness of the walls, be exceedingly disturbing.

St. Paul's Cathedral has been quoted more than once as a parallel case as regards conditions, and it has been claimed that there the traffic is no disturbance. However this may be, the cases are not parallel, for at St. Paul's (1) the road traffic is practically on one side only, the other being blocked by a bar which is seldom opened, (2) the road is laid with asphalt instead of granite setts, and (3) there are no electric cars.

The St. James's Mount site possesses the great advantage of being free from all undue noise and disturbance.

#### *Available Space.*

In addition to this there is the advantage of a large free and open space. The St. James's Mount site affords plenty of light and air, and gives an entire open area of 22 acres, against the 8 acres of the Monument Place site, the ground available for the cathedral itself being 1,020 by 248 feet, that is to say 5 acres, as against 4 acres at Monument Place, and situate in a clear space nearly a quarter of a mile long and 200 yards wide.

#### *Foundations.*

The foundations at the St. James's Mount site will rest in solid rock, which in some places shows on the surface. They have already been proved, and would probably cost less than on other sites. At the Monument Place site there is a railway tunnel underneath one corner, which might prove a source of very great inconvenience.

#### *Architectural Possibilities.*

The architectural possibilities at St. James's Mount are thus eloquently set forth by three gentlemen whose names are held in high and deserved regard in our midst. Mr. Geo. Bradbury, diocesan surveyor, and past president of the Liverpool Architectural Society, speaks as follows:—"The architectural effect as regards situation would in my opinion quite equal, if it does not surpass, anything we have in England. The cathedral would probably stand on a level platform about 13 feet above St. James's Road at its north end. The nave floor would, therefore, be about 150 feet above the level of high-water mark, and about the same level as Hope Street, facing Gambier Terrace. The view of the cathedral for the whole length of that part of Hope Street, viewed across the pretty hollow of the cemetery, would be something almost unique in England, and of great magnificence. The St. James's Mount site is in my opinion the only one in the whole of Liverpool that meets the conditions of a Liverpool cathedral." Sir Edward Russell, dealing with the subject at the public meeting

of June 17, 1901, spoke on this point as follows:—"I have been somewhat affected by the glorious prospect . . . of the great church on the heights of Montmartre near Paris, which is in many respects almost identical in its effect with that which we shall have if we use the St. James's Mount site for the cathedral. It is impossible to imagine a more inspiring sight than that afforded by that great church in the vicinity of Paris." The Dean of Ely, a native of Liverpool, and a resident in the city as boy and man for many years, and a well-known authority on cathedral architecture, makes the following emphatic statement:—"I cannot at all understand how any citizen of Liverpool who really knows and loves his town, much less how any architect or artist with the least spark of poetic imagination, can be blind to the picturesque and romantic possibilities of 'the Mount' as a site for the mother church of the city."

#### *Further Objections to Monument Place Site.*

In addition to the satisfactory nature and distinct advantages possessed by the St. James's Mount site, it is due also to consider, further, certain grave disadvantages, besides those already named, attaching to the Monument Place site, from which disadvantages the St. James's Mount site is either wholly or almost entirely free. Among such objections may be enumerated:—

#### *The Housing Question.*

If an attempt had been made to get an Act of Parliament sanctioning the purchase of Monument Place site, there would certainly have been a clause inserted in the Bill compelling the promoters to provide houses within a reasonable area for all the working classes displaced. There are upon the site no less than sixty-three such dwellings, and when it is remembered that the rehousing must take place near to the original spot, and that in the nature of things, owing to modern methods and modern sanitary requirements, the new houses must take up a greater space than the old, then the task will be seen to be one of enormous, if not of prohibitive, difficulty.

#### *Landlords and other Interests.*

It is obvious that to satisfy these, when regard is had to the high value of land and property in the neighbourhood of Monument Place, a totally disproportionate and excessively large sum would be required in comparison with the St. James's Mount site.

Moreover, the large and numerous trade interests which exist on the Monument Place site and in its neighbourhood would call for heavy compensation in the event of the site being acquired for a cathedral.

Again, it must be noted that the Monument Place site being an extremely valuable property with high rentals, the rateable value naturally rises in proportion, amounting in fact to 6,784*l.* net assessment, and if the site were acquired for such building purposes as those under consideration, there would ensue a loss to the ratepayers of the annual sum of about 2,250*l.*—an enormous loss compared with that at St. James's Mount.

The net rateable value of 6,784*l.* per annum at thirty years' purchase represents a capital sum for the site of no less than 203,520*l.*

Another difficulty would arise in connection with rights of light. These rights would be considerations to be seriously reckoned with in the case of such a lofty building as a cathedral, with transepts perhaps 100 feet in height, reaching out on each side towards adjacent property, and rising above it so as to overshadow it, to say nothing of the tower or spire, which might reach a height of 300 feet. The comparatively free and open space at St. James's Mount reduces this difficulty to a minimum.

The foregoing is for the most part a plain statement of facts. To the unprejudiced inquirer these facts cannot but carry conviction. It is not claimed that the site is perfect, but it is claimed that it is remarkably and exceptionally good, that it possesses in great measure all the necessary qualifications of the ideal site, and that it is by far the best in Liverpool. The decision to adopt it, as the Dean of Ely justly remarks, "is a wise one, not only on grounds of economy, but on grounds of utility and art." It is an accident, though a fortunate one, that the cost promises to be but small. No thought of mere economy has influenced, or would ever be allowed to influence, those on whose shoulders rests the weighty responsibility—deeply felt and recognised as such—of erecting for the people of this important and populous diocese a cathedral church which shall be in every respect worthy of this great community, with its manifold associations and interests, its mighty wealth and influence, its untiring industrial activities and its world-wide commercial relations; and shall stand as a witness, both in our own and all future ages, to the true spirit of devotion and worship amid the turmoil of life, wrought out and expressed in the most noble and enduring form, by the builders of the twentieth century.

### GENERAL.

**The King** has been pleased to appoint Mr. Guy Francis Laking, M.V.O., to be Keeper of the King's Armoury.

**Mr. W. Emerson** has returned to England after spending several weeks in Calcutta as the guest of Lord Curzon, in connection with the designs for the All-India Victoria Memorial Hall at Calcutta.

**The Late Mr. W. F. Porter**, architect, has left property valued at 39,801*l.* 14*s.* 11*d.* The late Mr. W. Henry Martineau's property is returned at 31,953*l.* 8*s.* 4*d.*

**The Union Centrale des Arts Décoratifs** have arranged for the inauguration in the spring of the museum containing the collections in the Pavillon Marsan.

**The Court of Common Council** has sanctioned the construction of a public subway between the Bank station of the Central London Railway and the Lombard Street station of the City and South London Railway at the level of the booking offices.

**The Victoria Memorial** in Sind is to take the form of a colossal statue of Her Majesty in Carrara marble, the work of Mr. Hamo Thornycroft. The statue, which is to be erected opposite the Frere Hall at Kurrachee on a specially prepared site, is estimated to cost 6,000*l.*

**The Salle Adolphe Rothschild**, in the Louvre, containing works in precious metals presented by the late M. Rothschild, will be opened on Monday, the 17th inst.

**The Parliamentary Committee** of the County Councils Association have drawn up a resolution expressing the desirability that county councils should have, with regard to main roads, vested in them powers to make by-laws prescribing the line and level of all new buildings abutting on such roads, and that a clause to the above effect should be embodied in the Highways Bill to be introduced into Parliament.

**The Government** has promised to present to Cape Town a site and a pedestal for the King's statue to be erected there. The funds for the statue itself will be raised by public subscription.

**The Cardiff Tramways Committee** have been considering tenders for supplying generators for the new electric tramways. The tenders were divided into two classes, "English" and "Foreign." A member of the committee at once proposed to exclude the German tenders, although they were the lowest. This was agreed to, and the English and American tenders were considered. The committee recommended the acceptance of an English tender, that of Messrs. Dick, Kerr & Co., although it was not the lowest.

**The Authorities** of the 'Rhine' province and the Moselle valley in Germany have been ordered to prohibit the exhibition of advertisements likely to spoil the views of the landscapes in their respective districts.

**The First Commissioner of Works** has stated that arrangements have been in negotiation for the acquisition of properties necessary for the isolation of the National Gallery, and provision for the purchases is made in the estimates for 1902-3. As soon as possible after April 1 next the purchases will be completed. It is hoped that possession will be obtained and the premises demolished this summer.

**Mr. Andrew MacCallum**, the painter of forest scenery, died at Holland House studios, London, a few days ago. He was born in Nottingham, and was at one time director of the School of Art at Manchester.

**Messrs. Spottiswoode & Co. Ltd.**, have brought out another edition of their List of English Clubs in all parts of the world. There are many additions, and over 800 golf clubs are included in this edition. It will be invaluable to travellers and men who have business in foreign States or in the Colonies.

**M. Gervex** is now engaged on a portrait of Prince Napoleon who will be depicted in his study engaged on the preparation of his work entitled "Memorial de Saint-Hélène."

**The Portsmouth Corporation** have decided that the statue of Queen Victoria to be erected as a Coronation memorial will be without the three medallions of local celebrities first suggested. Mr. Drury, the sculptor, is of opinion that the town hall square would provide an ideal site for the statue. If the statue were placed by the town hall the building would dwarf it. A sub-committee has been elected to confer with the roads and works committee as to the site and to carry out the work.

**M. Pierre Langier**, of the Théâtre Français, has presented to the Musée Luxembourg the bust of his uncle, Etienne Arago, who was at one time conservator of the gallery. It is the work of the late Carrier-Belleuse.

**The Manchester Society of Architects** will hold its fifth sessional papers meeting in the board-room of the Chamber of Commerce, No. 44 Mosley Street, on Thursday evening next, February 13, when Mr. Charles M. Hadfield A.R.I.B.A., will read a paper entitled "English Architecture of the Fifteenth Century," which will be illustrated by lantern views.

## EDITORIAL NOTICES.

Of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

## TENDERS, ETC.

A great disappointment is frequently expressed at the non-observance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

WIMBORNE.—March 1.—Plans are invited for laying-out a pleasure ground about 6 acres of land in the centre of the town. Mr. Nelson F. Dennis, A.M.I.C.E., surveyor.

WIMBORNE.—March 29.—Competitive plans are invited for the proposed public offices, fire-station and town hall for the town. Premiums of £100, £75 and £50 will be awarded for the first, second and third best plans. Mr. Nelson F. Dennis, A.M.I.C.E., surveyor.

MELBOURNE.—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West Melbourne.

WIMBORNE.—May 14.—Competitive designs are invited for the proposed town hall, the cost of which must not exceed 40,000l. Premiums of 150l., 100l. and 75l. are offered for the three best designs. Mr. F. Bagshaw, borough engineer, Municipal Office, Harrogate.

IRELAND.—Feb. 26.—A premium of £20 is offered for the best and cheapest report, plans, specification and estimates, &c., for providing the town of Kanturk with a wholesome supply of water. Mr. Mt. Timothy Guiney, clerk to the Kanturk Rural District Council, at the Boardroom of the Workhouse.

LANGHO.—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200l., 150l. and 100l. respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

MONTROSE.—Feb. 15.—Suggestions are invited for an ornamental fountain to be erected in the Mid Links of Montrose in memory of the late Provost Scott. Price must not exceed 150l. Mr. A. Middleton, solicitor, Montrose.

NEW MALDEN.—March 5.—Designs, &c., are invited for public offices, fire-station, cart sheds, stables and mortuary to be erected at New Malden, Surrey. Total cost of buildings not to exceed 5,100l. Premiums of 25l. and 10l. respectively are offered for the best and second best design. Mr. C. T. Lewis, clerk to The Maldens and Coombe Urban District Council, 7 Market Place, New Malden.

## CONTRACTS OPEN.

ACCRINGTON.—Feb. 17.—For erection of shops, offices, stores and assembly-rooms. Messrs. Haywood & Harrison, architects, Post Office Chambers, Accrington.

ALDRETH.—Feb. 14.—For erection of a bridge at Aldreth, over the West River. Mr. Herbert Leete, county surveyor for Isle of Ely, Ely.

THE second sessional meeting of the Historic Society of Lancashire and Cheshire took place on the 30th ult., Mr. Paul Rylands presiding over a crowded audience. After the usual formal business several members exhibited objects of interest. A lantern lecture on "The Ancient Streets and Boundaries of Liverpool," by Mr. W. Fergusson Irvine, was then given, the lecturer expressing his opinion that Liverpool was a village of importance before it got its first charter from King John, its history being traced on to the seventeenth century, up to which time it had made slow progress. After the seventeenth century the town increased by leaps and bounds, with wider streets, greater residences, and wealthier merchants and tradesmen, and the enjoyment of almost unbounded prosperity, the city fathers of that time showing forethought for the future welfare of Liverpool. After a short discussion a vote of thanks, proposed by Mr. T. May and seconded by Mr. W. Handley, was heartily accorded to Mr. Irvine for his paper.

**BUILDING AND BUILDERS.**

At a meeting of Kelso Town Council it was unanimously resolved to acquire at a cost of 500l. a site in Bowmont Street for the erection of a free library for the town. The site is 100 feet by 90 feet.

PLANS for the proposed new church for St. John's, Hopwood, Hopwood, to replace the present iron structure, have been sent to the Ecclesiastical Commissioners for approval. It is suggested that the foundation-stone be laid on May 23.

THE quarterly meeting of the executive of the Scottish Building Trades' Federation was held in Dumfries on Friday last, when members were present from different parts of the country. Mr. Robert Lamb, building contractor, Edinburgh, president, occupied the chair. The secretary, Mr. James L. Kirk, C.A., Glasgow, submitted the quarterly report, which related the progress made with the various matters engaging the executive's attention. An interesting discussion took place on all the points in the report, and important suggestions were made. At the close of the business the members were entertained to dinner in the Commercial Hotel by the local association.

A SPECIAL joint meeting of the health and team committees of the Wolverhampton Town Council was held on Tuesday, the 4th inst., to consider the desirability of providing destructors for the purpose of dealing with the refuse of the town. Some difficulty has been experienced by the health committee in obtaining tips for depositing the town refuse, and they have decided that the only alternative is a destructor. Enquiries have been made as to the work of destructors in other towns, and it has been decided to advise the Town Council to construct two destructors. The cost is estimated at about 22,000l. One of them will probably be erected with a view of providing power at the electric generating station in Commercial Road.

**VARIETIES.**

It is rumoured that the Middlesbrough town clerk, Mr. St. Bambridge, who has been ill for the last nine months, will tender his resignation at the next meeting of the town council.

A NEW hall in Hull, to be known as the Stratten Hall, was opened last week. It is, when furnished, to be used as a dining hall for the 250 orphans of seamen in the home, and has been erected at a cost of about 2,000l.

As a mark of the estimation in which the British Fire Prevention Committee is held abroad, the Imperial Federation of Fire Brigades in Austria (Esterreichischer Feuerwehr Reichsverband) have nominated Mr. Edwin O. Sachs, the committee's chairman, to be an honorary corresponding member, and the Royal Italian Fire Brigades Association have also asked Mr. Sachs to accept a similar distinction. The Belgian Fire Federation, too, recently elected Mr. Sachs to be an honorary corresponding member.

CONSEQUENT upon the increase of its business, due to the absorption of the Equitable Fire and Accident Office, the London and Lancashire Fire Insurance Company has decided upon the following changes in its home branches:—Mr. Owen D. Jones, who, for the past fifteen years has been the company's local manager in Newcastle, will be transferred to Leeds to take charge of a new branch about to be opened there, to control the entire business of the company (both fire and accident) in Yorkshire. Mr. Charles E. Fox, resident secretary of the accident department at Bradford, will now be attached to the Leeds office in a similar capacity. The present offices of the company at Bradford and Huddersfield will be maintained under the charge of the present resident secretaries, Mr. Walter Miller and Mr. S. F. Johnson respectively. Mr. Samuel Butler, who for the past eleven years has been the local manager of the company in Dublin, will take up the position of local manager at Newcastle. Mr. Thomas M. A. Nolan, hitherto local manager of the Equitable at Dublin, will become local manager of the London and Lancashire, and will have charge of both the fire and accident business in the provinces of Munster, Leinster, and Connaught. Mr. James M. Scott, the present local manager at Belfast, will take charge of the whole of the Ulster business, both fire and accident.

**ELECTRIC NOTES.**

THE Pontefract Guardians have had presented to them by Mr. MacGowan, chairman of the committee, and the prime mover in the electric light scheme, a comparative statement showing the relative cost of gas and electric light on the union premises, from which it appeared that there had been a saving, by the introduction of the electric light, of 15l. on the half-year. Mr. MacGowan said he had still hopes of the ultimate saving being 60l. per year, as he predicted. The report was adopted.

tion has now been made available at their registered office, 7 Pall Mall, S.W., the counting-house has been removed to that address. The accommodation at No 9 Grosvenor Mansions, will therefore be devoted entirely to sales. The company also announce the engagement of Mr. H. Brome Tarry, for many years with Messrs. Lucas & Aird, the great contractors, who will act as manager with Mr. Holland (late assistant trade manager of Messrs. Ind, Coope & Co.), as general assistant, and Mr. W. G. Haywood will remain as before, works superintendent.

### TRADE NOTES.

SUNDERLAND Road junior school, Gateshead, has been ventilated by means of Mackay's patent direct-acting invisible roof ventilators, supplied by the sole makers, Messrs. Cousland & Mackay, ventilating engineers, Glasgow and Manchester.

ST. JOHN'S CHURCH, Devizes, has lately been fitted by Messrs. John King, Limited, engineers, Liverpool, with their well-known "small tube" hot-water heating apparatus, employing their economical coil heater with waterway firebars.

THE Safety Elevator Company, of Albert Works, Deptford, have just erected the electric passenger and goods lifts and hydraulic hoist at the new premises of the Gramophone Company, 21 City Road, and they have also secured the contract for the four electric passenger and eight service lifts for the King's Mansions, West End Lane, Hampstead.

### SMALLPOX AND VACCINATION.

THE alarming dimensions to which the spread of smallpox is attaining is bringing forcibly home to the minds of employers of labour the advisability of instilling among their employes a just appreciation of the desirability of, or rather the necessity for, vaccination. Many firms have, we believe, made vaccination a *sine qua non* of their workers continuing in their berths; others have adopted persuasive rather than coercive measures. Among the latter are Messrs. Colls & Sons, the well-known builders, to whose employes Mr. Howard Colls addressed the following letter:—

"My dear Friends,—I have just heard that one of our bricklayers has left his job, and is found to be suffering from smallpox. I hope no others have caught it, but it has brought

very forcibly to my mind the necessity of revaccination. Some of us may perhaps have objections, but I think we laymen ought to be guided by the practically universal opinion of the hospital physicians that revaccination is a tremendous safeguard. If they are right we are positively helping by not submitting to spread this dire disease, and even if there is any doubt about their being right, the risk we run by not submitting is so infinitesimal that I do not think we are justified in letting it weigh with us. So as I believe one owes it to one's family, friends, and to those working side by side with us, to be revaccinated, I urge it very sincerely upon you, and I will very gladly arrange for the medical officer to come to the yard or to any job unless you prefer to go to your own doctor.—Yours faithfully,  
J. HOWARD COLLS."

It is satisfactory to learn that as a result of this kindly and thoughtful appeal 160 of the men at once submitted themselves for vaccination, and no doubt their example will be speedily followed by the others.

### FIREPROOF STEEL ROLLING SHUTTERS.

UNDER the heading "An American Warehouse" we published in our issue of 17th ult. a description of a newly-erected building at Columbus, Ohio, and we now purpose giving particulars of one or two of the specialties which were mentioned as being employed in its construction.

Kinnear's Steel Rolling Doors, Shutters and Partitions which were extensively used, are not unknown in this country but whilst they were employed in this building as a means of rendering it fireproof, they are more familiar here as partitions and shutters for car sheds at tramway depôts, having been adopted by the Corporations of Nottingham, Cardiff, Wallasey, &c., and at electric generating stations. But the numerous purposes for which they are suitable and have been adopted will be better understood and appreciated when their merits are more fully known. In addition to the above purposes these shutters are supplied for large entrance doors to warehouses and factories, as partitions for large floor areas, for fireproof doors and fireproof curtains for windows and in each of these they have some feature to specially recommend them.

These shutters, which are made of galvanised steel, differ in construction from the ordinary iron shutter, which depends for its flexibility upon the laths being hinged together at the

8, BRADFORD AVENUE,  
LONDON, E.C.

lock, for each lath or slat is so shaped at top and bottom that they are self-locking, and from end to end form a continuous flexible joint.

The shutter is attached to a shaft containing springs, the length of which are regulated so as to counterbalance the weight of the shutter in any position. A small gearing attached to one end of the shaft enables any person by means of a lever-chain to raise or lower the shutter as desired. A single shutter, measuring 35 feet 6 inches wide by 20 feet high, has been fixed and is found to be as easily operated. Where the opening is of great length and more than one shutter is required, they can be supported by centre-posts which are hinged, and these can be hoisted along the ceiling after the shutters are closed to give a clear opening.

When used in warehouses as doors they effect a great saving in floor space, the space sliding doors take up being all that is occupied, for goods must be kept clear of them, whereas with Kinnear's shutters they are out of the way until required. Where it is necessary to partition off one half of the floor, the centre-posts being hinged, as already mentioned, enables the whole floor space to be available without posts or rails.

When these shutters are used as fireproof doors angle-iron grooves are built into or can be attached to the walls. The construction of the laths allows for any expansion or contraction, while preventing the possibility of flames getting through the joints. Where, however, they are intended to act automatically the shutter is left coiled, held in position by a flexible link in the centre. The bottom is weighted so that it will come down by gravity when the link has been fused, but to insure its prompt action springs which are fixed at each end, press upon the bottom angle iron, causing it to drop immediately. The automatic fire doors are also constructed in another manner. They are fixed without shaft or hoisting arrangement, and are not balanced by springs. Instead, one end of the shutter is attached by expansion bolts to the top of the opening, and is then rolled up from the bottom and secured by a cable and a fusible link. The sides are provided with hinged grooves, which are open so long as the shutter is up. When the link is fused and the shutter comes down the hinged grooves automatically close on to it, and are clamped tightly in position.

The necessity for windows being guarded by automatic fireproof curtains has often been proved, but never perhaps so strikingly as by the great Jewin Street fire, where building

after building was attacked through the openings afforded by the windows to the flames blown across the narrow streets; and there can be no doubt had there been proper protection at these most vulnerable spots, the fire could never have reached such alarming magnitude. The Kinnear steel rolling shutters acting on any of the above principles can be applied to windows, and have proved successful not only in experimental tests, but under the severe test of a fierce fire that destroyed the whole of the adjacent property.

The window shutters, when subjected to a temperature of 150 degs., automatically close and prevent the interior of the building being attacked by fire from outside the building. By a most ingenious arrangement, should the fire occur inside the building, any or all of the shutters are readily opened to admit of water being poured on the seat of the fire by the firemen directing water from the hose on to the shutters, which will entirely open or remain at any height desired.

To speak first of the test to which they were submitted by experts, a house 18 feet high, 8 feet deep and 10 feet wide, with four windows and two doors, was fitted with Kinnear's window-shutters and fireproof doors. Within 5 feet a wooden building 14 feet high was placed, filled with combustibles and fired. The shutters and doors all automatically closed, and after fifty minutes, when the fire was burning itself out, the fireman's hose directed a stream of water against the upper shutters, which were immediately raised, showing the glass and sash frame uninjured. Immediately afterwards the fireproof doors were raised and the building filled with combustibles and again fired. The doors automatically closed, and although the fire cracked the building severely, none of the shutters buckled or permitted the fire to get through them, and after cooling were found in such condition that they were raised again by the gear-chains.

A fire that destroyed a large amount of property at Columbus, Ohio, was checked by a building entirely fitted with these shutters, which not only was uninjured itself, but prevented the fire spreading to property beyond.

Cabot's sheathing and deafening quilt is another specialty that was used both for rendering the building sound-proof and assisting in fireproofing the interior. This "Quilt" consists of a felted matting of eel-grass (*Zostera marina*), held in place between two layers of tough manilla paper quilted together, the long ribbon-like fibres of eel-grass crossing each other at every angle, and forming within each layer innumerable minute cells of "dead" air, making a soft elastic cushion. It is

claimed for this quilt that for insulation of dwellings and cold storage, and for deadening sound, it is wonderfully effective, clean and inodorous, light and easy of application, and no matter how long in use never becomes solid. The claim that eel-grass never rots seems well founded, for the walls of the old Pierce House, Dorchester, Mass., which was built in 1635, were found, when opened in 1895, to be filled with it, and showed no signs of decay. We are informed by the B. and S. Folding Gate Company, of Tower Street, Upper St. Martin's Lane, W.C., who are the sole agents in this country for this quilt, as well as for Kinnear's shutters, that Cabot's quilt is being very largely used for sound deadening in flats, &c., for lining roofs, and for insulating cold storage buildings, effecting a great saving in space. When used as a means of fireproofing the quilt is covered on both sides with heavy asbestos paper, which, combined with the non-inflammability of eel-grass, renders it, when applied to the walls and floors of buildings, an excellent fire-resisting material.

### NOTTINGHAM MASTER BUILDERS.

THE Nottingham Master Builders' Association held their annual dinner at the Victoria Station Hotel, Nottingham, on the 31st ult. The chair was occupied by the President of the Association, and the vice-chair by Mr. F. H. Fish, the vice-president. The loyal toasts having been duly honoured, Mr. James Wright, the honorary secretary, proposed "The Mayor, Magistrates and Corporation," and offered to the mayor and sheriff their hearty congratulations upon election to their respective positions. No doubt their worthy mayor would have to take part in the Coronation celebrations, and it would be a source of satisfaction if he were able to invite all the citizens of Nottingham to take part with him in rejoicings at the fulfilment of peace and termination of the deplorable war in South Africa. As to the magistrates, his own view was that the administration of justice would gain by the appointment of a stipendiary magistrate, although he fully recognised the services rendered by the unpaid magistracy. With regard to the Corporation they, as an association, were perhaps more directly concerned with the growth and development of the city than any others, and they were as ready to acknowledge that the Corporation had given them a clean, well-drained and well-governed town as anyone. They appreciated the vast improvements that had been made

during the last ten years, and all that they desired to say was that they were anxious that the Corporation should continue its progressive policy, and continue to develop the city both in its material growth and in its moral and intellectual developments. They had a right to ask, however, that when great improvements were undertaken they should be undertaken with due regard to economy. Furthermore they, as an association, felt that a great deal of the work undertaken by corporate bodies could be very much better done on contract.

The Mayor, in reply, said that it was the aim of the Corporation to make the city as popular and as successful as they could, and they desired to give all trades every facility to carry on their business without introducing too many stringent regulations. Speaking individually, he thought that the Corporation ought not to undertake any work that they were not absolutely bound to do. It was only fair that they should give the trades of the town every facility to work according to the ordinary laws of supply and demand. He certainly thought that building work would be better done by individuals than by corporate bodies. The question was as to whether the corporate bodies received as good a return for the money they spent as did individual firms. If they did not, they were doing an injustice to the ratepayers and a gross injustice to the people associated with the particular business in hand. With regard to the stipendiary magistrate he rather fancied the people who went before the Bench did not always want the strict letter of the law, and he failed to see what advantage they would derive under such a system. Touching upon the question of the regulation of buildings, he thought that it was clear that the Corporation ought to have more power than they possessed at present. He had noticed a great many letters in the papers recently about the fire at Lenton, but it was the easiest thing in the world to write letters, and he held that the Corporation had done so far all that they could reasonably have been expected to do. The matter of the fire-brigade was receiving the serious consideration of the watch committee, and before many weeks he thought that the brigade would be put on a perfectly sound and satisfactory basis. They had to move by degrees, but he had an idea as to the points which needed improvement, and he hoped that their action would meet with the approval of the citizens.

The Sheriff also replied.

Councillor J. Wright submitted the toast of "The Architects." Modern builders, he remarked, had a great deal to do

### A SPLENDID RECORD.

Two Great Newspapers.

Recently the owner of a foundry saved by the May-Oatway Fire Alarm wrote:—"It is the best," and now the *New Zealand Star*, referring to a big gas explosion in its own premises, says:—"A satisfactory feature is the test it gave to the efficiency of the May-Oatway Fire Alarm apparatus. Though only a little heat was generated the apparatus promptly signalled the alarm, and the fire brigade arrived." The *Otago Daily Times*, whose premises are also protected by this system, in referring to the *Star* explosion, says:—"It would thus appear that the May-Oatway Alarm is as efficacious in the case of an explosion as it has already proved itself to be on an outbreak of fire." This confirmation of its high reputation gave great satisfaction to the Brigade and Insurance authorities, the two great organisations of which have unanimously recommended this system.

with architects, sometimes to their cost. They often had difficulties with the architects, and were compelled to reduce their prices. They as builders ought to get a living wage, but they did not. The working-man got the living wage, and the builders got the rest. He wished that the architects had more confidence in the builders, and he could assure them that the desire of the builders was to work amicably with them.

Mr. A. W. Brewill, in response, agreed with the proposer that the whole difficulty between the builders and the architects was the regrettable one of £ s. d. He was often sorry that they could not go back to the old times when the architect was the master builder, and when he loved his work. If they had large buildings to erect nowadays they had to rush them, and under such circumstances it took a great deal of pleasure from the work. He sincerely wished they had some system whereby all contracts were remunerative, the contractors receiving a fair price without running the risk of losing money through strikes and other unforeseen circumstances. He thought it was fair to say that there had been a great improvement in the architecture of the buildings in the city during the last few years.

Mr. John Lewin, C.C., introducing the toast of "Success to the National Federation and the Nottingham Master Builders' Association," said that organisations of master builders were of comparatively recent growth, and they had been brought into existence by the organisations which existed on the part of the men. The last statistics with regard to trade unionism in the building trade showed that they contained 190,000 members, with an income of 347,000£, and an annual expenditure of 93,000£. They had funds of 412,000£, and in one year they spent a sum of 57,000£ in strikes and one of 72,000£ in management expenses. That meant that 129,000£ had been spent to fight the employers. Undoubtedly trades unionism had a useful part to play, and had played a useful part in bettering the condition of the workers, but there was only too good reason to believe that in recent years it had abused its high privileges. The very existence of master builders had in recent years been jeopardised. They had nothing to fear from demands for high wages, for that was a matter which would work it according to the laws of supply and demand, but seeing that their industry was the second largest in the country, it ought not to be unduly hampered and restricted as it had been. His charge against trades unionism was that the restrictions they had sought to enforce had tended to seriously cripple the trade. The restriction of the output was a fatal policy alike to work-

men, employers and the community at large, and he was afraid that the unions had unduly and unnecessarily interfered with liberty of management. He was beginning to feel also that even the cherished doctrine of the standard rate of wages did not work out as it was intended that it should. It contained a high ideal, to make the good compensate for the bad, and when they had large buildings to erect nowadays they had dragged down the good and the efficient to the level of the bad and inefficient. Unless the builders were prepared to stand together their troubles were on the increase.

Mr. J. N. Greenall and Mr. F. H. Fish responded briefly.

The remaining toasts were "The Visitors," cordially submitted by Mr. Enoch Hind, and acknowledged by Mr. J. Sulley, and "The Chairman," proposed by Mr. W. Edgar.

### LONDON WATER BOARD.

THE Water Bill introduced into the House of Commons by Mr. Walter Long has been printed. It is a considerable measure, covering twenty-eight pages. The first clause deals with the formation and constitution of the new Water Board of the Metropolis, which will buy out the existing companies' undertakings and supply water within "the parishes and places in which any of the metropolitan water companies are authorised to supply water, and the parishes of Sunbury, Chessington and Cuddington." In other words, all those who are consumers under the following companies will come within the exercise of the powers of the new authority:—

The Governor and Company of the New River brought from Chadwell and Amwell to London, commonly called the New River Company.

The East London Waterworks Company.

The Southwark and Vauxhall Water Company.

The Company of Proprietors of the West Middlesex Waterworks.

The Company of Proprietors of Lambeth Waterworks.

The Governor and Company of Chelsea Waterworks.

The Grand Junction Waterworks Company.

The Company of Proprietors of the Kent Waterworks.

The Staines Reservoirs Joint Committee.

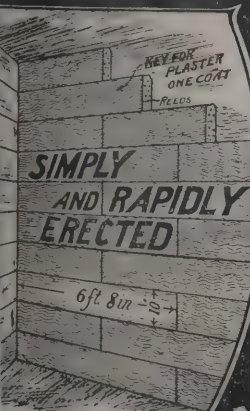

There are certain exceptions. The Bill provides that "such parts of the boroughs of Croydon and Richmond, and of the urban districts of Cheshunt, Enfield, Tottenham and

Ware as are within the limits of supply shall cease to be within the limits of supply, and the powers, rights and duties of the councils of those boroughs and districts with respect to the supply of water shall extend throughout their respective boroughs and districts." For the lapse of these rights of supply compensation will be payable to the Water Board, besides a sum for the mains and other apparatus, but the board may be required to supply water in bulk to these authorities, or to "any rural district situate wholly or partly within the limits of supply."

A period must occur before the companies' concerns are transferred, and the Bill contains certain "transitory provisions," one of which runs:—

"Until the appointed day the undertaking of each metropolitan water company shall be maintained and carried on by the company as heretofore in the ordinary course of business, but if the Water Board think that any appointment to any office or service of the company, or any contract with respect to any matter connected with the undertaking, or any alteration in the rate of salary or wages payable to any officer or servant of the company, made by the company subsequently to the introduction of the Bill for this Act was not reasonably necessary in the ordinary course of business of the company, they may give notice in writing to the company to that effect within three months after the appointed day."

All such matters will be referred to the arbitration court. The Water Board take over the several companies' officials at their present salaries, and those whose services are dispensed with will receive compensation, and the auditors of the accounts of the companies will also be paid an "annual or other sum" on the withdrawal of their appointments.

The shareholders of the companies concerned will receive Three per Cent. Metropolitan Water stock, which must be issued to each corporation within three months of the decision of the Court of Arbitration fixing the purchase sum, and in the meantime money equal to the last two half-yearly dividends will be paid by the Water Board, with any additional sum "in respect of the reasonable expectations of increasing dividends (if any)." It is also proposed that—

"Within two years from the appointed day all irredeemable debenture stock shall be extinguished, and the Water Board shall issue to the holders thereof in substitution therefor the amount of water stock to which they are severally entitled under this section.

"The Water Board shall within eighty years from March

31, 1903, purchase or redeem, and pay off, all redeemable debenture stock and all mortgage debts, and any stock so purchased or redeemed by the board shall, as from the date of the purchase or redemption, be extinguished and cancelled."

The new Water Board will be presided over by a paid chairman and vice-chairman (serving for three years), who need not be members before election, but if they are members their appointments will create vacancies. The new body will consist of sixty-seven members, constituted as follows:—

#### INNER LONDON.

London County Council	10
Common Council	2
28 Metropolitan boroughs (six having two members each—Islington, Kensington, Lambeth, St Pancras, Stepney and Westminster—the remaining 22 one)	34

#### OUTER AREA.

West Ham	2
Willesden, East Ham, Leyton and Walthamstow, one each	4
County Councils of Kent, Essex, Middlesex, Surrey, Hertfordshire, and Conservancies of the Thames and Lea, one each	7
Grouped outside Urban Districts	8

Each outside grouped district will elect members of its council to serve on a joint committee, and from each of these committees one representative will be elected to the Water Board. These joint committees will be formed by members from the urban councils, each authority being represented by the number of members given in parentheses:—

Buckhurst Hill, Chingford, Loughton (1 each), Waltham Holy Cross (2), Wanstead (3), and Woodford (4)
Beckenham, Bromley (4 each), Chislehurst (1), and Penge (3).
Bexley, Dartford (2 each), and Erith (3).
Ealing, Acton (2 each), and Chiswick (1).
Brentford (3), Hampton (2), Hampton Wick (1), Hanwell (2), Heston and Isleworth (5), Sunbury (1), Teddington (3), and Twickenham (4).
Edmonton (2), Hornsey (5), Southgate (1), and Wood Green (2).
Kingston (6), East and West Molesey (2), Esher and the Dittons (3), Ham (1), and Surbiton (4).
Barnes (2), the Maldens and Coombe (1), and Wimbledon (5)

As was explained by the President of the Local Government Board in his speech, the court of arbitration will consist of Sir Edward Fry, Sir Hugh Owen and Sir John Wolfe Barry. Any two may act with the same authority as a judge of the High Court, and their decisions cannot be called in question by anyone with one exception:—

"Provided that the court of arbitration may at any stage of the proceedings at an arbitration, and shall, if so directed by the Court of Appeal, state, in the form of a special case for the opinion of the Court of Appeal, any question of law arising in the course of the arbitration."

As Mr. Long has stated, the costs incurred by water companies will be borne by the Water Board, and also those of any other person if directed by the Court. One clause in the Bill lays down the basis upon which the judgment of the arbitrators shall be formed in arriving at the value of any undertaking:—

"In determining the amount of water stock to be issued to any metropolitan water company, the court of arbitration shall not make any allowance in respect of compulsory sale, and shall not take into account any enhancement or depreciation of the market value of any stock or shares of the company, which in the opinion of the court was caused by or resulted from the passing or the anticipation of the passing of this Act, but the court may make such allowance as they think just for covering any expenses which have been or are likely to be incurred in consequence of the passing of this Act, and which ought, in the opinion of the court, to be borne by the Water Board."

### NATIONAL REGISTRATION OF PLUMBERS.

THE annual meeting of the District Council for Hull, East Riding of Yorkshire and North Lincolnshire, for the national registration of plumbers, was held in Hull on the 23rd ult., Alderman Dr. Sherburn, J.P., presiding.

Dr. Sherburn said all who took any interest in the well-governing of the city were most anxious to do what they could to elevate the plumbing craft to a high position among the skilled trades. The work of the plumber was fraught with serious responsibility, in so far as it was connected with the public welfare and health. He had no hesitation in saying that the mortality of such large towns as Hull was largely decreased by the character of the work done by plumbers. The mind of the public was ripe for legislation upon this important matter, affecting as

it does the public health. Our national asset was our public health, and the public had a right to demand some evidence of the efficiency of the men who did such important work as the plumbers did. It was their duty to see that the air was not polluted with dangerous gases which emanated from sewers and gained access to our dwellings. There was no doubt that the duration of life was longer than it used to be, and that the general state of health was better than formerly. That was due to the fact that there was a greater knowledge of the laws of public health, and that plumbers had wonderfully improved in their work. He advocated the necessity for examinations of plumbers, which would have the effect of keeping them a body composed of none but efficient men. This matter, he said, should be pushed forward, and there should be statutory legislation to make it compulsory.

Councillor Cohen moved:—"That this meeting cordially approves of the movement for the national registration of plumbers as a safeguard to the public health, and recommends that the Government be urged to deal with the subject during the ensuing session of Parliament, and that copies of this resolution be sent to the First Lord of the Treasury, the President of the Local Government Board, the Home Secretary and the local members of Parliament."

Mr. W. L. Harrison, president of the National Association of Master Plumbers, seconded the resolution, which was carried unanimously.

### SOCIETY OF ENGINEERS.

THE first ordinary meeting of the Society of Engineers for the present year was held on Monday evening, February 3, at the Royal United Service Institution, Whitehall. Mr. Charles Mason, the president for 1901, first occupied the chair, and presented the premiums awarded for papers read during that year, viz.:—The President's Gold Medal to Mr. H. Alfred Roechling for his paper on "The Sewage Question during the last Century"; the Bessemer premium of books to Mr. Roger G. Hetherington for his paper on "The Main Drainage of Ilford"; a Society's premium of books to Mr. Arthur T. Allen for his paper on "Concrete Subways for Underground Pipes"; a Society's premium of books to Mr. Sydney A. Hollis for his paper on "Preliminary Investigations for Water Supply," and a Society's premium of books to Mr. J. Freebairn Stow for his paper on "Irrigation Works in South Africa."

Mr. Mason then introduced the president for the present year, Mr. Percy Griffith, to the meeting, and retired from the chair, receiving a hearty and unanimous vote of thanks for his services during the past year.

The President then delivered his inaugural address.

After acknowledging the honour conferred upon him by his election to the presidential chair, and expressing his determination to do his utmost to warrant the choice of the members, Mr. Griffith proceeded to deal with the domestic affairs of the Society. After pointing out the satisfactory condition of the membership roll and the Society's financial position, reference was made to the visits to works, the annual dinner and the annual general meeting, which last it was proposed to render somewhat more attractive in the future than it had been in the past. Mr. Griffith then dealt at some length with the objects and position of the Society in regard to the modern conditions under which its work was carried on, emphasising the fact that, in spite of the large number of kindred societies by which it was surrounded, its position was still firmly maintained and its objects were clearly defined and successfully accomplished.

The President then dealt with some of the broader aspects of the question of water supply in this country, pointing out that even at the present time there were many towns and districts without any public supply whatever and others in which the supply was very deficient. The causes of this state of affairs were then indicated as being the very imperfect system of control and allotment of responsibility, the irregular and haphazard selection of areas of supply, the peculiar physical characteristics of the country generally, and the present system for allocating the various available sources of supply. He then pointed out the unsatisfactory effects of the rivalry existing in many places between local authorities and water companies, and suggested some limit being placed on the power of the former to interfere with or oppose the latter. The concentration of the population in the large cities and the consequent increase in the demand for water in such cases, and the growing practice of seeking new sources at long distances from the area to be supplied were then remarked upon. After pointing out a few elements of risk connected with long conduits, Mr. Griffith suggested that local sources of supply should in every case be developed to their utmost capacity before large gravitation schemes were undertaken.

The difficulties attaching to underground sources were then referred to, the condition of the water supply in the county of Essex being quoted as an illustration. As representing modern

practice in regard to deep borings, descriptions were given of the boring recently completed at Gainsborough, which was the largest in the kingdom, and that recently commenced at Lincoln, which was intended to be 700 feet deeper, both under the supervision of the President. Attention was called to the modern practice of dispensing with wells and pumping direct from borings, and to the necessity for special attention being given to the design of the pumping machinery in such cases, an illustration being given from actual practice. The President dealt with the newly imported American system of lifting water by compressed air, and pointed out its advantages and disadvantages, expressing his opinion that the system was not applicable to any cases where the ordinary form of pump could be used.

In connection with gas engineering, the President refrained from dealing with the details of manufacture on the ground that they had been fully discussed and described in the transactions of the various gas institutions; and, after remarking upon the great benefits conferred on the gas industry by the introduction of electric lighting, proceeded to describe the present position and future prospects of the system of incandescent gas lighting. Under this head, Mr. Griffith ventured to forecast the possibility of illuminating power in gas being ultimately subordinated to calorific power, and pointed out the vastly increased scope for the gas industry afforded by the reduction in cost of manufacture which such a change would bring about. Having remarked upon the enormous lighting efficiency of coal gas rendered possible by the incandescent burner (40 candle-power per cubic foot of gas per hour as against 3 candles per cubic foot with the argand burner), the President strongly urged the necessity for extending the practice of superintending consumers' fittings at reasonable rates.

In conclusion, Mr. Griffith referred to the remarkable advances made by the introduction of high-pressure lighting for external purposes, and briefly described the work done in this connection by Mr. William Sugg, the Welsbach Company, and Mr. Scott-Snell. A description of the automatic air pump or pressure-intensifier, which is operated entirely by the waste heat from the burners, invented and recently much improved by the last named, then followed, and a reference to the inverted incandescent lamp, also recently introduced, concluded the address.

The address was listened to with marked attention by an appreciative audience, and at its close a hearty vote of thanks was accorded to the President.

## THE WEEK.

YEAR ago, when discussing the DE FALBE tapestry case, we recommended that a further appeal should be brought to the House of Lords. In a mansion at Luton 100 seven pieces of tapestry belonging to the tenant for life were hung. Three pieces were treated as pictures and were fastened to the wall in such a way that they could be easily removed. In the drawing-room efforts were made to conceal the mode of attachment of four pieces, as if it were desired to suggest that they were to be kept in those positions permanently. When the case came before Mr. Justice BYRNE he discriminated between them. He decided that the tapestries in the hall were not permanent additions to the building, while those in the drawing-room had been annexed to the mansion-house and became part of the estate. In the Court of Appeal it was held that the rules about fixtures had been relaxed, and as at Luton nothing was done except what was necessary for the owner's enjoyment of the tapestries, the pieces belonged to the owner's executor rather than to the heir to the estate. In the House of Lords there was agreement with the decision of the Court of Appeal. The Lord Chancellor said it was not easy to see how the tapestries in the drawing-room could have been more slightly attached than in fact they had been. They could never have been intended to form part of the house. The difference of opinion in the Courts below on the subject arose less from the state of the law than from the alteration in modes of life. Lord MACNAGHTEN agreed with the Lord Chancellor. Lord SHAND maintained that there had been changes in the law, but they were in favour of the tenant. A tenant might decorate the house he occupied with pictures, tapestries or other ornaments, or even with a parquet flooring, and so long as there was no damage by the process they could be removed. The other lords present agreed that the tapestries were only chattels. The case is remarkable, but it will not be wise to apply the final judgment in too liberal a manner. The owners of ornamental property, their dealers and frame-makers, are not necessarily authorities on fixtures; and, as we said before, the costly litigation between the executor and the heir or remainderman in the DE FALBE case might have been avoided if an architect or surveyor had been consulted about the hanging of the tapestries.

THE action, PARKER v. W. F. STANLEY & Co., LTD., which was decided by Justice FARWELL, is interesting as the latest enunciation of the law by which top lights are treated as ordinary windows. When additions are made to houses by building in backyards, in the majority of cases it is necessary to light them from above. Behind No. 288 High Holborn was a one-storey building which had been used as a restaurant. In 1890 it came into the possession of the plaintiffs, who are photographers. They carried out various alterations; the skylights were enlarged for a part that was to be utilised as a studio, while over another part that was to serve as a dark room the skylight was obscured. An adjoining strip of land that was partly bounded by a building 33 feet high belonged to the defendants. They required additional workshops as mathematical instrument-makers, and accordingly raised the building. The plaintiffs, considering the access of light was interfered with, sought an injunction. The defendants denied that the light was diminished, and alleged that by obscuring the part required for a dark room the right to ancient lights was abandoned. A further plea was that the plaintiffs were entitled to no more light than had been needed for the restaurant. Mr. Justice FARWELL, in his judgment, said that the darkening or obscuring of the skylight could only be regarded as temporary, for the room might have to serve the purposes which required light from above. Where the old skylight had been replaced by a new glass skylight the plaintiffs were entitled to have as much of it as was formerly occupied by the old window or skylight to be treated as an ancient light. The fact that the premises were once used for a restaurant was immaterial. Photographers required special light, and the plaintiffs

were justified in complaining, although they had only carried on business since 1890. His Lordship said he was constrained to grant a mandatory injunction, but it would only relate to the obstruction caused by the increased height of the new part of the buildings. He advised the parties to come to some arrangement. It is bad policy to undervalue restaurants in similar cases, for the late Vice-Chancellor MALINS, whose experience was wide, was always certain to decide in favour of a plaintiff who held such premises if one or more of his customers declared that new buildings prevented them reading a newspaper with as much ease as formerly. His Lordship seemed to think that, where so much is uncertain, there was no surer test of diminution of light, and acted accordingly.

THE difficulties which attend underground water-supply are revealed by a statement which was made at Lewes on Tuesday. A very costly asylum is now in course of construction by the County Council. In order to obtain a water-supply borings have been made to a depth of 326 feet without success. The machinery has broken at that depth and further progress is at an end. The consequence is that no water appears to be available, and the committee are in a fix. It has been decided to seek expert advice. This case by itself is enough to suggest the necessity of a more scientific study of well-boring. Accordingly, the volume on the subject by Mr. C. ISLER, which Messrs. SPON have published, could not be issued at a more opportune time. So many asylums and other institutions are now in progress which have to depend on wells for their independent water-supply, the old-fashioned empiricism seems to be inadequate to cope with the obstacles. In the volume the different kinds of wells are described and illustrated, as well as various systems for boring. Among these, deserved attention is given to Messrs. MATHER & PLATT'S deep-boring system, which is said to combine many of the advantages of other systems without their disadvantages. For such emergencies as now are nullifying the operations at the Sussex Asylum, special apparatus are provided, one being a breaking-up bar, weighing about a ton, which either drives the boring-head through the material or breaks it into fragments. The system is also adaptable in dealing with running sand. French as well as American methods are also dealt with. Mr. ISLER'S book is applicable to boring for brine and petroleum, as well as for water. We believe that in the majority of cases the operations are best carried out when entrusted to specialists, but architects should be in a position to understand what is practicable, as well as the contingencies which may have to be encountered. Much information of a useful kind, and derived from experience, will be found in the pages.

AMONG German architects WILHELM BÖCKMANN holds a prominent place, and his public and private works entitle him to recognition by his brother artists. During some forty years he has been in some way connected with all the great building works in Berlin and other cities, and his loyalty and kindness were among the factors which led to the recent celebration of his seventieth birthday in a festive manner. For others besides the Government he has shown himself to be a wise counsellor. He is a native of Elberfeld, and was long associated with HERMANN ENDE, the president of the Academy of Arts. To the partners, and especially to BÖCKMANN, is due the disposition of the suburbs of Berlin. The Zoological Gardens is unquestionably the finest example of its class in Europe, for those who walk or drive through it on their way to Charlottenburg have a conviction that a part of the primeval forest had been prepared for their especial use. In the laying out of streets BÖCKMANN'S services were invoked in the majority of the principal cities of the Fatherland, and his influence has extended as far as Tokio. The buildings he has erected are of all varieties; he has also written much about architecture, and from his wide experience what he says is always accepted as trustworthy. Visitors to Berlin will remember the Architektenhäuser in the Wilhelmstrasse, and its renovation has been in a great measure due to BÖCKMANN. Architects of many countries who have had the privilege of meeting Herr BÖCKMANN will unite with his fellow-artists and compatriots in wishing him every happiness.

## THE LATE SIDNEY COOPER, R.A.

IF the large number of pictures which SIDNEY COOPER produced and the still larger number which are fraudulent imitations of them can be taken as a test, he must be recognised as among the most popular of modern English painters. For some classes of people it seemed to be imperative that at least one of his cattle-pieces should adorn every respectable dining-room, and it must be owned that guests were to be found who admired his simple compositions beyond more ambitious efforts. There was a correspondence between his works and a very general feeling among the public. The "country" and all that belongs to it have a hold on Englishmen, although they are compelled to spend their lives in cities. The crowds that visit agricultural shows, cattle shows and horse shows are all evidence that rural life has votaries besides those who are occupied with agricultural and pastoral pursuits. For them SIDNEY COOPER painted. All classes could understand his pictures. There was no need to have a line of description attached to any of their titles in a catalogue. Even children out of back alleys could appreciate the subjects, for they knew that the figures represented stages in the preparation of beef or mutton.

In that way SIDNEY COOPER appealed to what is a human necessity, the love of animal food, and as long as the world does not become a habitation of vegetarians such pictures as his must be enjoyed. Hence there was also a refreshing honesty in the praise given to his works. There is much affectation surrounding art in all forms, and men give large sums to possess pictures which they do not understand and are incompetent to esteem. But one of COOPER'S cattle-pieces presented no subtleties or conundrums to the spectator. If a man were only able to obtain occasional glimpses of the country, he could have witnessed such scenes from the window of a railway carriage. The representations might be prosaic, but they corresponded with the citizen's recollections.

There was so much that was characteristic of England in SIDNEY COOPER'S pictures, they might be utilised as a text by a foreign critic. According to EMERSON, hunting is the fine art of all Englishmen of condition, and they associate well with dogs and horses. But the late painter had no sympathy with the pastimes of the Nimrods of his country. He preferred the old Saxon regard for cattle and sheep, which, although humbler than the horse or deer, are more useful to the community. On that account SIDNEY COOPER was often made to suffer as if he were the representative man of whatever was inartistic, material and commonplace in painting. Some of his contemporaries in the search for novel subjects went far afield, and they were able to find supporters. From time to time we have had a Classic spirit, an early Italian spirit, a modern French spirit and a Spanish spirit predominant, and a man was regarded as being vulgar or an ignoramus if unable to yield allegiance to the supremacy of the latest idea. If a painter thought it was unsafe to completely change his old manner, he made at least more or less concessions. With SIDNEY COOPER styles might come and styles might go, but he went on year after year as if not one word respecting new theories had entered his ears. If he were given to boasting, he could with safety have defied Mr. RUSKIN and told him to do his worst. The persistent and undisturbed fidelity to what pleased himself became so exasperating, there seemed to be a possibility five-and-twenty or thirty years ago that painters and visitors to the Academy would join in a protest against his occupation of so large an area of wall space, but the artist himself remained unmoved, and repeated the old forms under similar conditions. It might be concluded that English painting came under no new influences during seventy years, and that, in fact, our artists were unteachable.

His peculiarities arose to a great extent from the circumstances of his early life. He belonged to a very humble family, and was born in Canterbury in 1803. Canterbury then, and for long years afterwards, could not be reckoned a propitious place for an embryo artist. But it had one glorious embodiment of the beautiful in the cathedral, and the streets presented much that was picturesque. He tells us himself how "My childish attempts at drawing went on the same simple way for many months, the great church always remaining my model.

After that I used to take my slate out into the fields to try to sketch anything that took my fancy, such as cottages, bridges, trees and so forth, and in this way I learned to love the works of nature, while simply copying what I saw. On one occasion he surprised the Archbishop by asking him for a pencil, and on another occasion GEORGE CATTLEMORE, who made such charming drawings of Mediaeval buildings and Mediaeval warriors, gave him paper and pencils. But for the English GIOTTO there was no CIMA to take him by the hand and to watch over him until his talent was sufficiently developed. His first practical application of art was as a coach-painter. Then he was employed to adorn the Canterbury Theatre and to paint such scenery as was required. He also worked as a painter of scenery at Hastings. After the accession of GEORGE IV. sympathy was excited for the king's hapless but imprudent wife. Transparencies were exhibited of scenes in her trial, and SIDNEY COOPER took part in painting them. Then his uncle, who apprehended that his nephew would bring disgrace on him if he were allowed to associate longer with strolling players and other irregular people, offered him a home in London, and held out hopes that he could gain admission into the Royal Academy School. In the necessary preliminary studies at the British Museum he had companions GEORGE RICHMOND, who afterwards became a portrait-painter and an Academician, and CATTLEMORE SMITH, who for a long time was the principal portrait-painter in Dublin. COOPER'S drawings secured for him the right to attend the Academy schools. He said that he was present at FUSELI'S last lecture. The Swiss artist resigned the office of Professor of Painting in 1804, when he was elected Keeper, but afterwards the by-law was suspended and he was allowed to hold the two offices. At that time there was much irregularity at the time, he might have delivered an occasional lecture at which COOPER would have been present.

There was then nothing to indicate what manner of subject SIDNEY COOPER would follow. LANDSEER was only a year older, but it was easy to see by the works exhibited from his fourteenth year onwards that he was destined to be an animal-painter. His success does not seem to have excited the young Canterbury artist to a rivalry. He was content to return to his native city, and to give lessons in drawing there as well as in the neighbouring towns of Dover and Margate. The arrival of a French competitor was fatal to his prospects as a teacher, and he resolved to try his fortune abroad. In 1827 he left England and made his way to Brussels. There he became acquainted with VERBOECKHOVEN, the animal-painter, whose work aroused the latent ability of SIDNEY COOPER. He settled down in the Belgian capital and married. He might have remained there all his life, but the Revolution of 1830 made him feel he was a foreigner and in danger from the mob. He fled to England with his wife and child. When he landed at Dover to begin once more the battle of life he possessed no more than 13s.

At the time EDWIN LANDSEER had gained reputation but his animal paintings were dramatic. The *Alps Mastiffs Reanimating a Traveller*, the *Prowling Lion*, the *Larder Invaded*, the *Cal's Paw*, the *Highland Cottage*, the *Monkey who had seen the World*, the *Pets*, *Lassie Feeding Sheep* and the *Hunted Stag*, all of which had been exhibited before COOPER'S return to England, were unlike the old-fashioned Dutch paintings in which animals were introduced. SIDNEY COOPER therefore resolved to avoid ambitious subjects, and to confine himself to the cows and sheep he was able to see and use as models in Regent's Park. His own account of his start is as follows:—"I had taken a second floor in the Tottenham Court Road, and morning after morning with an orange and a couple of Abernethy biscuits in my pocket, I used to set out for Regent's Park, where there were often from five hundred to a thousand cows in the days, and try and sketch them. My methods were simple. I always had six or eight sketches going at one time, so that if a cow moved from one position I could go on with another, and only wait until I caught my cattle friend in an old position. At night I worked at home over my pictures and earned my daily bread by drawing them on stone. ACKERMAN." The dealers were shrewd enough to recognise the value of his work, and when in 1833 he exhibited a picture, *Landscape and Cattle*, at the Suffolk Street Gallery

the critics at once perceived it was not the work of a novice. The facetious THEODORE HOOK offered him employment as a critic of paintings. In 1834 he contributed for the first time to the Royal Academy the first of the Canterbury series. Mr. ROBERT VERNON, who was a veterinary surgeon, was able to appreciate the truth of the representation. He purchased it, and *Milking Time: Study in a Farmyard near Canterbury*, is now one of the nation's pictures. SIDNEY COOPER was grateful for at once finding a purchaser, and the house he built for himself near Canterbury was a memorial of his early patron, for he called it "Vernon Holme." Nearly sixty years afterwards he wrote:—"Having been successful in getting the first picture I sent in for competition accepted by the Council of the Royal Academy, I determined it should be through no want of effort on my part if I failed upon any subsequent occasion. I therefore continued to work very hard, and my exertions were rewarded by success; for, from the first year that I began to exhibit at the Academy to the present date (1890), I have never once missed having one or two, and in later years even more, pictures in the exhibition, though often my contributions were only commission pictures."

From that time onwards SIDNEY COOPER'S success was unvarying. Some people may now be surprised that his work was preferred to JAMES WARD'S. But although the painter of *The Bull* lived until 1859, after 1830 he only painted occasionally, and as if for a pastime. COOPER'S field might be a narrow one, but there was really nobody to trespass upon it. He therefore continued to paint cattle pasturing, reposing or watering, and for all of them purchasers were to be found. In 1837 he slightly altered his themes in *The Drover's Halt on the Fells, Cumberland*. The picture was sold in 1887 for 455 guineas, a sum which suggests that in fifty years his works had not become diminished in value. In 1845 he was elected an Associate of the Academy, but twenty-two years had to elapse before he could attach the letters "R.A." after his name. He was in 1901 appointed a Commander of the Royal Victorian Order, and beyond that he received no other distinction. From foreign exhibitions he gained no medals or awards. His art was too English to satisfy strangers.

A catalogue of his pictures would be less generally interesting than those of the majority of painters' works. It was not necessary for him to compete with himself by seeking a diversity of subjects. There was nothing dramatic or anecdotic about his paintings, and in that way, as in others, they differed from LANDSEER'S. Year after year he was able to follow the even tenor of his way, and the variations of one year's subjects from those of the preceding or the subsequent year were so slight as to be inexplicable without diagrams. His life, too, was uneventful. He therefore thought much of receiving a commission from the late QUEEN to paint a picture representing some of the cattle on the Osborne farm. But his introduction of conventional dock leaves and a pool in the foreground did not satisfy the royal agriculturists, for in their minds they were indications of careless culture. The artist used them for the same reason as brown trees were employed in the eighteenth century for the sake of contrast.

Having attained so much success, SIDNEY COOPER wished to express his satisfaction for a happy life by founding a School of Art in his native city, which was also to serve as a memorial of his mother, to whom he owed much. In remembering his own condition, the instruction was most gratuitous. The school was, however, made over to the Science and Art Department. The late Lord LEIGHTON delivered one of his best discourses in it about the aptitude of country youths for painting; but in spite of all the endeavours the school has not yet produced any extraordinary results. The attention to it and the picture gallery attached to it formed a diversion for SIDNEY COOPER. He and people were willing to give higher prices for his works, the climax being reached when 2,500*l.* was paid for *The Monarch of the Meadows*, a picture which was stolen from its owner, but afterwards returned.

In his life he followed as regular a routine as if he had been one of the Mediæval monastic painters who lived under the rule of a superior. His own account of how he passed a day reveals the repetition which was observed

year after year:—"I always go to my painting-room," he says in his "Reminiscences," "at seven o'clock in the morning in the summer, half an hour later in the winter; set my palette and paint till breakfast is ready, at eight o'clock. For this I eat oatmeal porridge, some bread, and drink about half a pint of milk just warm from my own cows. I have not tasted a cup of tea or coffee for thirty-six years. I find the porridge very sustaining, and at the same time very provocative of appetite, while it keeps the head clear for a morning's work. Then I return to my studio and paint till lunch, at twelve o'clock, when I eat well and drink but little, after which I paint again till three. Then I clean up my palette for the day, and go out for my walk, returning in time to wash and prepare for a six o'clock dinner, which I enjoy, without my glass of port, for I have quite given that up, and every other kind of wine, since my last severe illness. After this I read my newspaper; at nine o'clock I smoke my cigar, and at ten o'clock I am off to bed." A man who was able to live so simply in an age of luxury, and who amidst the pessimistic influences of our time remained cheerful after an experience of almost a century becomes a testimony to the salutary influences of art. We can overlook the shortcomings of his pictures when we think of the example he set of systematic labour kept up to the very end, and of the continued solace for the weakness of age which he found in the practice of recording natural scenes.

#### THE ART OF THE ILLUMINATOR.\*

IT is commonly supposed that the influence of Prince BISMARCK has prevented a more general adoption of the use of Roman letters in the printing of German books and newspapers. Although there are objections to German text and it is thought to have much to do with the prevalence of weak eyes among the people, yet a statesman of the Prince's experience would hold there were advantages which compensated for the premature adoption of spectacles by his countrymen. In the first place, the type is a distinct announcement of opposition to the Latin race, and by the acceptance of it much is gained in political and other ways. In the next place, the characters unite modern Germany not only with the times of GUTENBERG and FUST, but with a far earlier age. To the majority of people the ordinary German text appears identical with the lettering seen in most of the illuminated manuscripts that were prepared in monasteries from the fifth century, and hence the influence of the country is assumed, although erroneously, to be traceable to a remote date. The same effect is to be observed in architecture. The calling of the style of which the pointed arch is an element by the title "Gothic" has created a belief in its German origin. Frenchmen who ought to know better have succumbed to the fallacy, and since 1870 despise a style which with good reason they might have claimed as their own. Even HEINE, who in all that relates to art was broad-minded, could see in Gothic only a creation of German faith. When he conjured up the visions of his childhood, one was the Mediæval cathedral rising from earth to heaven, and he heard sweet hymns in which the tones of organs and of bells united with wailings like his own:—

Ich sehe wieder stolz gen Himmel ragen  
Den frommen Dom, den deutscher Glaube baute,  
Ich hör' der Glocken und der Orgel Laute,  
Dazwischen klingt's wie süsse Liebesklagen.

Much else besides German faith is to be witnessed in Gothic, and the influence of German forms in architecture was not extensive in Mediæval days.

The belief in the connection with Mediæval times has, however, been advantageous in many ways to Germany. At the present day it is the only country in Europe in which illuminating is a living art. It is true that in walking through some parts of London one can read announcements in letters of many colours in stationers' windows about the production of illuminated addresses and other documents.

\* Board of Education: *Historical Introduction to the Collection of Illuminated Letters and Borders in the National Art Library, Victoria and Albert Museum.* By John W. Bradley, B.A. (H.M. Stationery Office.)

There are churches, too, where lettering meets the eye which is thought to have been inspired by Mediaeval art, and is usually produced by some amiable young ladies of the congregation. A German would be as amused with those specimens of calligraphy and ornament as with much else which he sees around him. In Germany illumination is accepted as one of the arts which are subsidiary to architecture, and from practising it under such conditions the humblest effort, although it may not be as large as a page of note-paper, acquires a dignity and a style which are unattainable by our amateurs. A German illuminator is in fact a cultivated and interesting example of the modern craftsman. His work serves a variety of purposes. In the comfortable halls which are meant to recall "AUERBACH'S Keller in Leipzig," the walls are adorned with proverbs, witticisms, versicles, which have to be painted on a large scale, and are excellent exercises in illuminating. With the Germans manifestations of brotherly love count for much, and a man must be a misanthrope who cannot produce an address which he has received from the fellow-members of some Verein or society or from acquaintances of various sorts. The composition of complimentary letters is often a bore to most people in England. In Germany several people will unite and make their congratulations take the form of an illuminated tribute, which the recipient and his family will be glad to prize. Specimens of the art possess so many artistic qualities, they regularly find a place in exhibitions, and in no other variety of production is the German mastery of ornament displayed with so much skill. BISMARCK knew his countrymen thoroughly, and it is no wonder he fostered that form of text which holds so peculiar a place as an auxiliary to their affections.

It is characteristic of the position of illumination in England that the collection of illuminated letters and borders in our National Art Library "consists chiefly of pages, initials and ornaments that have been removed from the books to which they belong." The people who visit museums are indifferent to the relation which should subsist between a manuscript page and its ornamentation. They are charmed with the brilliant colours and the gilding. If they utilise the ornamental forms it is as an accompaniment to ridiculous lettering, and hence it is that so much is to be seen in churches which overcomes the reverence of the congregation. Now illumination cannot be appreciated properly unless we thoroughly understand its origin, or, as some would say, its second origin. The copying of books and the adorning of them with a diversity of figures and ornament is an ancient art. But the distinctive character of what is generally known as illumination originated with the early Christians. Much of the time of the Syrian solitaries was occupied in copying the Scriptures. All early monks and nuns engaged in some stage or other of similar work. We hear of an abess writing the Epistles of St. Peter in letters of gold. An abbot named DAVID copied the Gospel of St. John in a similar style. The art developed. More than one system of lettering was adopted; and it is even said that the small letters of the ordinary Roman type which is now used by printers in England and elsewhere are really derived from the lettering devised by English monks. As time went on the books became so beautiful, there was a rivalry between the ornamentists who painted the initials and the jewellers who fashioned the gold and silver plates that were used to enshrine the manuscripts.

Human nature was always much the same, and although poetry and romance have described the work in the monasteries as if every manuscript was the creation of one man's hand, there is no doubt that division of labour was taken advantage of for their production. BROWER, in his account of Fulda, compares monks of the abbey to industrious bees, each occupied with a specialty. He tells us how some of them were engaged in inscribing here and there upon the parchment the special letters and characters which were to be filled in; others were wrapping or binding the manuscripts in handsome covers; others were marking out in red the remarkable sentences or the heads of the chapters. Some were writing fairly what had been thrown together at random or had been left out in the dictation, and were putting every part in fair order. And not a few of them excelled in painting in all manner of colours and in drawing figures. Occasionally versatile monks were to be found.

Thus it is recorded of St. DUNSTAN that he was excellent in writing, painting, modelling in wax, carving and work in the precious metals, besides being a musical composer and a performer. How strong was the obligation to produce copies of books is seen from the narrative we have of the last days of Venerable BEDE. As he was no longer able to hold a pen he had recourse to dictating, and the two works on which he was engaged were a translation of St. John's Gospel and extracts from some treatise of St. ISIDORE. He kept imploring from time to time, "Take down what I say quickly, for I know not how long I am to last." The work was continued by the dying man. Then, as his voice seemed to fail, one of the monks asked, "Dearest master, one chapter is still wanting; can you bear our asking you about it?" The work went on until he was reminded that there was yet one sentence unwritten. The sentence was dictated by a great effort, and then BEDE murmured, "Consummatum est." With works produced under those circumstances much else besides the ornament deserves attention although under the conditions of modern life they are not likely to receive it.

The small book which Mr. BRADLEY has prepared as an introduction to the collection at South Kensington is issued in a style that is unworthy of its importance. It appears as if it were a flimsy guide that was to be cast aside after an hour's use. It is true the price is only 2s. 6d., but Government work should always be excellent. The Victoria and Albert Museum is not rich in specimens of the illuminator's art, and Mr. BRADLEY does not confine his attention to them. He gives an account of the art from the earliest times, and is careful to obtain as much information as possible about the technic employed in the different periods and to express it succinctly. The following are examples:—

*Classical and Early Christian.*—Little or no visible outline. The brushwork broad and decided, and applied in successive layers, dried between each application, in a kind of body colour called *tempera*, or in the thick wash technically called *gouache*. The vehicle, probably cherry-tree or other gum or white and yolk of egg, together or separate, beaten to cream and diluted with the sap of the fig-tree. Liquid gold used sometimes as a high light or to enrich the ornamentation.

*Byzantine.*—In most instances the miniature is painted on a ground of leaf gold. Colours bright, varied and mixed with a viscid and varnish-like medium, probably of egg-glair and gum, sometimes so thick as to scale off with age and use. Methods of working laid down in a system called the "Guide to Painting," and containing strict and invariable rules both as to materials, manipulation and subject.

*Celtic.*—The execution chiefly consists in penwork in black or coloured inks. The bands and frames are painted in various colours, often harmoniously arranged. The colours usually are *pale* green, red, violet and yellow; intense black and white, but *no gold*. The red is sometimes clear and deep. The vehicle or medium is firm and smooth, but less viscid than the Byzantine. The various colours, though often pale with white, are clear and permanent.

*Carolingian.*—The pen still the chief instrument, but the Italian or Byzantine mode of painting also used, except in the mode of applying gold, both in miniature and in ornament. Bands of body colour used as grounds on which letters and ornaments in gold and silver are placed. Colours: those used in Byzantine miniatures applied with a similar medium. They are violet, purple, blue, scarlet, green and yellow. The flesh painting is dark, but not executed on gold grounds, as in Byzantine work. The gold when used is laid on afterwards with a pen or brush.

*The Winchester School.*—Strong *tempera* or *gouache*, very thick and viscid and looking almost like oil-painting. Colour pure and bright, but varying in different examples, with preference, however, for green, red and yellow, as in Carolingian examples. Gilding profuse and solid-looking, as applied in the Western manner.

The Winchester School was not the only one in England, but towards the end of the tenth century it attained prominence. One of the best examples is the Golden Charter of King EDGAR which is in the British Museum. Another splendid work is the Benedictional belonging to the Duke of DEVONSHIRE. Careful copies of many of the drawings were made at the expense of the Society of Antiquaries, but as they are not coloured they have not the richness of the originals. This precious work is associated with the name of ÆTHELWOLD, Bishop

Winchester, which was then the capital of England. The style of treatment was recognised abroad as being most characteristic of the English illuminators, and became known as the "Opus Anglicum." The British Museum includes some examples, and there are others in Paris, Cologne, Rouen and Oxford.

In the history of art illuminations are of importance. They are anticipations of wall-paintings and stained-glass windows. The degree of skill for depicting objects which existed in various places and times can be tested by them. It is as the artists enjoyed more liberty than the painters of works on a large scale, they were able to introduce many things which help in suggesting some of the characteristics of the time. We can, for example, derive more information about the peculiarities of buildings from manuscripts than from frescoes or mosaics. The page of the copy of the Gospels which is in the South Kensington Museum, to take a case, contains, within the limits of the upper part of the letter P a representation of a metalworker's smithy in the fifteenth century. Sometimes local colour was respected, sometimes the reverse. Mr. BRADLEY says that the Byzantine artists ruthlessly ignored, disregarded and sacrificed the actual colours and tones of objects, furniture, utensils and buildings, and the dominance of the illuminator's special purposes was no less asserted in other periods. Art for art's sake was accepted, but in those times the art was the miniaturist's. The want of precision in perspective arrangements was also unfortunate, for it led to many absurdities.

Mr. BRADLEY is an enthusiast for Celtic illumination. The Gospel-book attributed to St. COLCLOMBA he declares to be "the most wonderful of Irish MSS., perhaps of any MSS. whatever. Once seen it is never forgotten; it is in itself both the finest type and the completest monument of Celtic art in existence." It is now in Trinity College, Dublin, with the Book of Kells, the Book of Durrow, the Leabhair Dimma, the Stowe Missal and the Garland of Howth. Dr. LAMBRECHT has endeavoured to prove that ornament similar to the Celtic prevailed in Germany before Irish work was known there. Mr. BRADLEY does not deny the possibility that corresponding forms may have occurred to designers in various parts of Europe. Like HERMANN SEMPER, he believes that the art of pattern weaving or plaiting of prehistoric tribes in zigzags, knots and interlacings had much to do with the penwork of early Irish manuscripts. He is also of opinion, and the same opinion has occurred to others, that mechanical helps of one kind were employed by the artists, for "the coils or spirals are so exact that they might well have been printed at the edge of a finely coiled wire or steel watch-spring, if such a thing had then been known." Like every other writer he speaks of the Book of Kells in glowing words. The page which has XPI as a motif he says, "This page is the very climax and culmination of all caligraphic art. It has never been equalled for variety, intricacy and alternating dexterity of execution, but its taste and patterns are more than half barbaric." If we grant that the Book of Kells was produced in the seventh century or earlier in a lonely island, the influence of a much earlier period is an advantage rather than otherwise.

In the thirteenth century the art of the illuminator was practised in its most advanced form in Paris, and a typical example of execution is the Psalter of St. Louis in the National Library. But changes soon became inevitable. Realism, as it was then understood, caused the ancient representations of living things to be undervalued. The comic element could no longer be kept out, and the illuminator was sometimes known as the "babouiner." With the progress of painting, sculpture and stained glass the simple work on vellum appeared of small account. In the course of time, when the art of painting was revealed, it was to be expected that illumination could retain its interest. At first the printers showed respect for the older work by endeavouring to imitate parts of the ornament, especially in elaborate initial letters. Some amateurs who were not favourable to the cheapening of knowledge preferred to have manuscript copies to printed copies. Mr. BRADLEY tells us that the Duke of URBINO was offended at the suggestion of his agent respecting the introduction of a printing press. The most superb of patrons, PAPA THIAS CORVINUS, long refused to allow printed books

into his collection. In fact, the old art has never ceased to find occasional supporters. The late WILLIAM MORRIS was the most recent example of an artist making a serious effort towards its revival. He was able, however, to form lettering as well as ornament, and he could find sympathetic artists to co-operate with him whenever figure drawings were essential. In Germany there would be no difficulty in producing large manuscripts, for there the art of caligraphy, as we have said, continues to be practised.

Mr. BRADLEY'S book may not lead to a revival of illumination, and it would perhaps be wiser to regard it as if it were the history of a lost art. It is no mere South Kensington guide; it is a review by an enthusiast of a long period, with every variation of which he has sympathy. Our only regret is that it is not presented in a form which will make its endurance as a work of reference more permanent. But whatever the outward form or the quality of the paper, the information it contains will be found both valuable and interesting by the student of art and the amateur.

#### PORTSMOUTH PARISH CHURCH.

THE following communication has been issued by the vicar, the Rev. Charles Darnell, M.A.:—The churchwardens and I thought it necessary to call in an architect of great experience in dealing with old buildings to examine the church, and, with the sanction of the Bishop of the diocese, we asked Mr. T. G. Jackson, R.A., to give us his advice. The Bishop's opinion is that no other man could possibly give us advice on which we could rely with greater confidence. We felt that it was necessary for us to have the direction of a man whose opinion would carry great weight, and the Bishop himself has told me that in the case of such a church as ours, we ought to have the advice of a man of undoubted position as an ecclesiastical architect. And such a man is Mr. Jackson. It is, of course, inevitable that we shall have criticism of whatever is proposed, but I feel confident that the vast majority of our people will accept Mr. Jackson's opinion, and feel that we have done right in calling in a man of his standing and capacity. For myself, I can only say that I could not accept the responsibility which is at this time laid upon me as vicar of the parish in connection with the church, unless I felt sure that my adviser was a man whose opinion would relieve me of all responsibility in the eyes of reasonable people as to the fabric. For our church does not belong to this parish alone. It is in some way unique, and for this reason, and also because of its antiquity and its beauty, is a cherished possession of the borough, of the county and of the whole country. I cannot find words to express my thanks to the churchwardens for the way in which they have approached this subject, and have supported me at a time of very grave responsibility. And I call upon the whole parish to support us and do their very best when the time comes to help us to do what is best and safest for the church. I say when the time comes, because we have not yet received Mr. Jackson's fuller report and his suggestions as to what is to be done. Something, of course, must be done without delay. Mr. Jackson is of opinion that without the beam he has put in, the chancel would not be safe from day to day. With that beam it is safe, but no time should be lost in getting to work to make it permanently so.

I have given formal notice to the Bishop and to Winchester College of the condition of matters, in my name and that of the churchwardens. As soon as any further step can be taken the whole matter will be laid before the parish.

But as it is necessary to get to work at the chancel I hope very much that the parishioners and the public at large will help us to do other work which no doubt ought to be done. The floor ought to be cemented or concreted over; the pews ought to be remodelled in some way to make them reasonably comfortable; the floor ought to be made level, and the church thus made fit for the worshippers and worthy of the old parish. There are no doubt some who dread any change. These I would ask to defer their judgment till I can lay before them a plan which, with the consent of the churchwardens, I have asked Mr. Jackson to prepare. When this appears I doubt if there will be any one who will object to it in itself. The difficulty as to raising the necessary money will face us and must be boldly faced. It is never well to be too confident, but in this case I feel that not to have confidence would be foolish. I believe that as the repairing of the chancel is an absolute necessity which has occurred in the ordinary course of nature and through lapse of time, there will be hundreds or even thousands of people throughout the country who will desire to have a share in the work of making the old parish church safe, and handing it on in that condition to future generations; and that

there will be many others who will rejoice to think that the other alterations in the nave have been made possible, and the church rendered more beautiful and more comfortable at the same time.

And I venture to state once more what is to me the most important point of all. The pews must be lowered if children's services are to be effective and catechising possible in the church. And I feel more strongly than I can easily express that the children have as good a right to have their services in the church as the grown-up people. We all know how great is the force of the associations of early days. Nothing tends more to keep people true to the church of their fathers than that the associations of their early childhood should be with the parish church. And when we have such a parish church as ours, so rich in tradition, so well fitted to rouse feelings of enthusiasm and devotion, is it not unfair to our children to deprive them of the use of it? And for what? That the present pews, which are in many cases unfit for occupation owing to their size and discomfort, may be unaltered, even to the extent of being lowered, and that there be no change. I cannot believe that such views will seriously confront us. It will, I believe, be possible to do all that is required without to any great extent altering the appearance of the present pews. Once more I venture to appeal to you all in this crisis of the history of our own church to wait till Mr. Jackson's suggestions are before you, and then to come to a just conclusion. It is a time of grave anxiety to all who admire and love the old church. For myself, I have complete confidence that our people will desire that the right thing shall be done.

### LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE members of this Society held their annual dinner at the Queen's Hotel, Leeds, on Tuesday evening. Mr. Butler Wilson, the president, was in the chair, and amongst the company of about thirty were present Mr. John Hepper, Alderman J. H. Wurtzburg, Mr. W. H. Beevers, Mr. G. F. Bowman, Mr. R. Wood, Mr. H. Slater, Mr. H. Perkins, Mr. W. H. Thorpe, Mr. H. C. Whigham, Mr. T. Greenwood, Mr. P. Robinson, Mr. E. J. Dodgshun, Mr. A. Grimshaw, Mr. Paul Rhodes, Mr. M. H. Watson, Mr. H. H. Cribb and Mr. H. S. Chorley (hon. secretary).

Mr. Hepper proposed the toast of "The Royal Institute of British Architects and Allied Societies," and observed that every man ought to have a high ideal in his profession. Unless his ideal was above himself, he had not the incentive to make the best of himself. Mr. Hepper went on to refer to the fortunate position of the architect who combined in his work both the capacity for scheming plans that were essentially practical and useful and the capacity of artistic designing at the same time, without additional cost.

The President, who responded, briefly alluded to competitions. So long as architects had to start without clients and so forth, they must continue to go on the market and find a start in life in the competition world. But they had a right to expect that the assessors in these competitions should be men who had had a practical experience in the particular class of buildings that was under consideration. Otherwise their awards could scarcely give general satisfaction. Continuing, Mr. Wilson said that there was to-day a very strong movement in the direction of dealing with architectural problems in a quiet manner and with a consideration for the requirements of their clients, without any regard to style or period. The advanced school had carried out this idea to an extreme degree. It appeared to him unreasonable that men should be asked to forget the architectural beauties of Yorkshire, for example. They must not be asked seriously to ignore the great store of knowledge which the world had placed at their disposal. There was no reason why they should not store themselves with this knowledge and, at the same time, be prepared to deal with every architectural question put before them strictly on its merits. In conclusion, such societies as theirs, said the President, must, to be successful, be based upon unselfishness.

Alderman Wurtzburg gave "The Leeds and Yorkshire Architectural Society," and incidentally, when speaking of the architectural improvements that had been effected in the city during the past few years, said that Leeds people used to be known as "loiners." In view of the number of arcades that had sprung into existence, he thought that Leeds might now be called Arcadia, and its people Arcadians.

Mr. G. F. Bowman responded, observing that local architects, when it came to a matter of public criticism, always came out a very good second—if not first—in comparison with architects in London and elsewhere.

In giving the toast of "The Guests," Mr. W. H. Thorpe deprecated the evils that the competition system brought with it. Architects were put to a great deal of expense, and with no

return in the majority of cases. He suggested that the might to a certain extent be minimised if a system of limited competition were adopted, by which, say, half a dozen members of the profession would be invited to send in plans, the unsuccessful competitors to receive an honorarium for their work.

The toast was responded to by Mr. J. W. Brooke.

### TESSERÆ.

#### Encaustic Tiles.

THERE were three varieties of Mediæval encaustic tiles. 1. Where the pattern is in relief and of the same colour as the ground. These appear the most ancient; the devices upon them (as indeed upon most others) are usually heraldic, i.e. either actual bearings, such as plain ordinaries, or lions passant, rampant, combatant, adorsed, regardant, &c., mullions and similar designs. The colour varies from black to red, the intermediate shades being sometimes found in the same piece of pavement and probably produced by different degrees of heat in the burning rather than by any difference in the material of which they are composed. These tiles are usually from 3 to 5 inches square; they are probably in many instances of Norman era, and are of rare occurrence. Some excellent examples are preserved at Castle Rising, Norfolk. They appear to have been glazed by being burnt to a vitrified state. 2. The second kind of encaustic tile is where the pattern is impressed or indented. In this case the lines are usually rather fine (about the thickness of ordinary wire) and the patterns simple, for the most part consisting of interlaced circles or parts of circles in the centre of the tile. They appear to be of Early English date. To the same age or class we refer those small plain glazed tiles of a greenish-blue tint, which are by no means uncommon, though antiquaries' taste seems to have thought them hardly worthy of notice, they are little known by description. With this tile Bayly Abbey and many small country churches were paved. The forms are usually either square or semicircular; they were perhaps used in considerably later times. 3. The third kind, the most common, the largest, most varied and by far the most beautiful. They are from 3 to 6 inches square, appear to have been highly glazed (though the glazing seldom remains at the present time) and seem to have been made by filling with clay which bakes yellow or white an indented pattern in sun-dried or half-burnt brick which bakes red. These tiles are of course durable in proportion to the depth of the white or yellow clay. A mere surface-pattern would be trampled very shortly. It is probable that this kind of tile was not used before the end of the thirteenth century. The very perfect and beautiful specimens in St. Cross's Hospital, near Winchester, are traditionally, we believe, called Norman, but they are probably of not earlier date than the Decorated window; there appear, however, to be several kinds of encaustic tile in that church, which must be discriminated from each other as of different styles. The heraldic bearings upon the will, of course, not unfrequently determine the precise date of such tiles. They very commonly occur of such a device that several tiles placed contiguously compose a complete pattern.

#### River Scenes in Painting.

There is no studying landscape proper near large cities, though there are effects for everyone's daubing. A black windmill throwing its hideous arms into a white cloud burst out of a dark grey one, a moor and a reedy puddle will thoroughly satisfy the ambition of many, humble enough to abject poverty in subject, presuming enough in effect. They take great pains that their deformities shall stare. Ere it is too late, and they become confirmed in their vulgar vanities, let them take coach an hundred miles or so and follow the course of some of our sweet rivers. Rivers are always poetic; they move or glide or break into fall and rapid through the courses as if they were full of life and were on natural mysterious errands. The sunbeams gleam upon them as messages from the heavens. Trees bend to them, and receiving freshness and fragrance, grow in their music; flowers kiss them, love haunts them, silence keeps awake in the caverns and sequestered nooks, and there the nightingale sings to her; the bright and many-coloured bow arches their fancies and the blessed and blessing moon shines on them and glows them with magic. Let them be followed from their sources mountain or moor, through dell, dingle, ravine and mere of valley, over which the clouds loiter to admire—"do rest;" and if the mind of the sketcher do not drink poetry through his eyes and convey it to his portfolio he may be sure neither nature nor art intended him to be painter or sketcher. But if he first his soul poetic and imbued with the feelings of the poets he reads, he will call up such ideas as will suit his scenery, enable him to give it a new character, perhaps nowise inconsistent with that it has or indicates, and he will thus study with purpose.

### The Dutch Garden.

Much ridicule has been bestowed upon the stiff formal style of gardening which has been designated the Dutch style, and which was introduced among us about the time of the revolution. The ridicule would have been better directed against those who adopted a style unsuitable to the nature of English scenery than against the style in itself, which is admirably suited to the circumstances of the country where it took its rise. It is not solely from want of imagination that a Dutchman delights in straight lined walks and clipped hedges. In a country so level as Holland it is natural that everything should be straight, precisely because there is no reason why it should be otherwise. If we have to go from one point to another the straightest line is always, *ceteris paribus*, the best, because it is the easiest and least expensive to make and the shortest to travel. Hence in Holland, where there are no hills or rising grounds, canals and roads are made as straight as an arrow; and to have made an exception of garden walks would have argued a degree of caprice and frivolity quite unworthy so steady, industrious and sensible a people as the Dutch, who never do anything without a good reason. Again, in a country where the soil is so rich, it is necessary that hedges should be clipped, otherwise they would grow so high as to occlude all view of surrounding objects. The transition is not very great from clipped hedges to clipped shrubs and trees, and where no natural features ever intrude to contradict the prevailing regularity, this sort of restraint upon nature's productions, in place of being absurd and ungraceful, is only in character with that universal neatness, the effect of art and industry, which meets the eye in every quarter. Dutch gardening, we therefore conceive, is exactly suited to the circumstances of Holland, and to the scenery, or rather, the scenery, which is to be found in that country. It was absurd to introduce it in England, as was attempted to be done by William III.; but that sovereign was distinguished by higher qualities than his taste for ornamental gardening.

### Early Christian Art.

The origin of Christian art was wholly different from that of the Christian religion. The art of Christendom came not by revelation, but through development. Its earliest works, while Christian in subject, were Pagan in type and style. Christian mosaics in the nave of Sta Maria Maggiore do not materially differ from the Pagan bas-reliefs on the column of Trajan. The mural paintings of the catacombs and their earliest sculptured sarcophagi are Roman both in the type of the heads and in the treatment and character of the drapery. The decorations likewise which adorn their chapels are similar to the arabesques found in the Baths of Titus and in the houses of Pompeii. There can be little doubt, indeed, that Pagan artists were frequently employed on these Christian works. We would readily have arrived at a different conclusion; we could rather have found in the catacombs an art pure and uncontaminated. We would eagerly have recognised in the earliest representations of Christ the type of His doctrines and mission, and it was with reluctant regret that we were forced to the conclusion that these earliest heads were likewise Roman and Pagan in origin. The Roman-Pagan and this Roman-Christian are, indeed, in art-style identical. The two and Christian sarcophagi of St. Helena, the mother of Constantine, and St. Constantia, his daughter, both now in the Vatican museum, are essentially Pagan, and in art, style and degradation do not materially differ from the debased small bas-reliefs of Aeneas and Dido of the same epoch, likewise in the Vatican museum. The new and pure faith thus adopted the corrupt art-style of the religion it superseded.

### Greek Antæ.

In Italian architecture pilasters are very frequently employed in lieu of columns, or are placed against a wall to correspond with a range of columns in front of it; their bases and capitals, too, are made to correspond with those of the columns, as far as the difference between a square and circular column will allow. The Greeks, on the contrary, never employed antæ, except at an angle or the extremity of a wall, and instead of aiming at perfect similarity they purposely gave to such pilasters, bases and antæ-caps dissimilar from those of the columns; neither did they diminish them, but made them of the same width above and below, which width was determined by that of the soffit of the architrave, and was therefore something less than the lower diameter of the column but greater than the upper one, since both in the Doric and Ionic the architrave overhangs the upper part of the column. Thus they kept the antæ and columns quite distinct in character, thereby producing variety and contrast without injury to consistency. Sometimes the Doric antæ has a simple kind of moulding above at its foot, which seems requisite to detach it from the wall, whereas the plain foot of the column resting on the pavement or steps defines itself to the eye quite sufficiently. The Doric antæ-cap is very simple, and its abacus and other mouldings much narrower than those of the column-capital. If such are not the case, the mouldings under the abacus being square

like that member, whose angles do not overhang them as they do the circular echinus, the whole would look exceedingly clumsy and coarse, and the capital be enormously wide in comparison with the antæ itself, because that being no broader at bottom than above, such capital would extend very preposterously far beyond the line of the base. Although more ornate than those of the Doric, Ionic antæ-caps differ still more than the others do from the capitals of their respective columns, inasmuch as they have nothing whatever answering to those exceedingly characteristic features, the volutes; nevertheless, they are so strongly marked by the same style as to render it impossible to mistake them or attribute them to any other order. Between the bases of the antæ and those of the columns there are very slight differences, the chief is that besides the upper torus being fluted like that to the base of the column, the under one is also enriched, but by reeding or convex mouldings. There is also an additional concave sweep moulding placed beneath the torus. It is further to be observed that antæ are never fluted, as is generally the case with Roman and Italian pilasters whenever the columns are so, and consequently a stronger distinction is kept up between the antæ and the columns, and in fact the plane faces of the former are very ill-suited for such channelling, which would only produce monotony by so many parallel lines and hollows all casting the same shadow, and least of all is the Doric mode of fluting adapted to such purpose.

### Canova's Church at Possagno.

The church which the sculptor erected at his own expense in Possagno, his birthplace, was designed by Selva, of Venice, but many modifications were introduced by the sculptor. The first stone was laid in July 1819. The building is remarkable for its portico, being almost the only instance of the application of the Athenian Doric in Italy, certainly the only one upon so large a scale. The columns are 35 feet in height, the entire height from the ground to the apex of the pediment 79, and the breadth of the portico 93; therefore the dimensions of the order are very nearly equal to those of the Parthenon, the difference in the height of the columns being only 10 inches. The rotunda itself is about 45 feet less in its internal diameter than the Pantheon, but is still sufficiently ample to be imposing. In its proportions and in its coffered dome, the centre of which has a glazed opening to light the whole interior, it resembles the Roman structure; not so, however, in design, for the architecture errs as much in being too plain and cold as that of the other building does in being broken into too many parts and too much cut up by heavy ornament. Like the Pantheon, the plan is divided into eight compartments, all of which form as many arched recesses, that within which is placed the door and the opposite one (forming a deep sanctuary for the high altar) being rather loftier than the rest. The arches themselves are quite plain, without either keystones or archivolts, and except the tabernacles or altars within the recesses, the only decoration is that produced by the panels filled with sculpture in the spaces between the arches. Nevertheless, taken altogether, it is a noble monument, especially when it is considered that it was raised by a private individual. The building cost about a million of francs, and a sum of 113,437 francs was set aside for repairs. The metopes of the portico were executed from Canova's designs by some of his pupils.

### Chinese Houses.

The construction of houses in China is directed by a public functionary, whom we may not inaptly designate a district surveyor. Every one is obliged to build his house according to his rank, and for every house a certain size and details are fixed. The ordinary habitations have one floor, and we may presume the houses of the common people in the towns to be crowded and badly ventilated, since the police force the people to sleep in the open air during the dog days, lest they should be suffocated. The houses called heon, that is, of many floors, were once very much the fashion, and some were built about 211 feet high. Wooden columns, so placed as to support the roof, are common, and are from 8 to 10 diameters in height. They are fixed on stone or marble bases, but have no capitals; an architrave of wood placed on the top of them runs through the wall of the house, and a beam which is carried through the upper part of the column, and passes through the wall also, is connected with the architrave on the outside of the house. The roofs, which are slightly constructed of bamboo, are often double, and resemble one roof rising out of the other; they turn up at the eaves, at the angles of which are hung grotesque figures of dragons, &c. The columns and beams are often made of precious woods, and are inlaid with ivory, copper and mother-of-pearl. Not the least singular appearance in a Chinese house is the door, which is often a complete circle; the window-frames and sashes are formed of small panels of various forms moulded out of clay and neatly joined together. The sills of doors are of stone. The wood of the nan-mon is said to last more than a thousand years. Stone and marble, though in abundance, are more rarely used than wood brick and tile.

### NOTES AND COMMENTS.

ACCORDING to a statement by Lord CURZON the grounds assigned in Calcutta where the Victoria Memorial Hall is to be erected are thirty acres in extent. It is proposed to have a raised terrace 400 feet in length on which the building will be constructed. In plan it will form a parallelogram, the principal front being to the west, as was originally proposed. In the centre will be a large hall to contain Mr. FRAMPTON'S statue of the late QUEEN, and which will at once strike all eyes on entering. On the right will be a picture gallery, and on the left a sculpture gallery; there are also to be rooms for various other collections. It is suggested that white marble, if possible, derived from India, should be employed in the building. It appears that 30 lacs of rupees, or less than 300,000/., have been promised, but a far larger sum will be required to erect the memorial hall, to allow for the purchase of works of art and the maintenance of the collections. Lord CURZON has been in consultation with Mr. WILLIAM EMERSON on the subject of designs.

THE German EMPEROR on his birthday presented to the city of Rome a bust of GOETHE. It will be installed in the Palace of the Conservators, a building which was designed by MICHEL ANGELO. The Conservators claim to be the successors of the ancient Roman senate, and the once renowned S.P.Q.R. is their distinguishing mark. A corridor in the building is known as the protomoteca, and was intended to contain busts of illustrious Italians. The collection was commenced by PIUS VII. and the busts were placed in the Pantheon. But about 1820 several of those of foreigners were removed from the church to the palace. As usual the Germans contrived to be well represented. WINCKELMANN'S bust is the work of DÖLL, who also executed one of RAPHAEL MENGES, the painter. ANGELICA KAUFMANN is by PETER KAUFMANN. The Irish sculptor, CHRISTOPHER HEWITSON, prepared the bust of JOHAN PICHLER, the gem engraver. There is also a bust of RAPHAEL STERN, the architect of the Braccio Nuovo in the Vatican. It will thus be evident that GOETHE'S bust will be among fitting companions. It is to be regretted that an equal number of English celebrities cannot be found in the protomoteca.

It will be difficult to foretell whether builders will be grateful or the reverse for the suggestions about scaffolding which have been issued from the Factory Department of the Home Office. Although we are told that leading experts have been consulted, it cannot be said that more safety than usual is insured. It is announced that copies of the documents have been forwarded to coroners, so that they may be in a position to form an opinion in the case of fatal accidents on buildings as to whether or not the necessary precautions have been observed by the persons responsible. It may also be assumed that in actions for compensation a wide departure from the suggested scaffolding would have an effect on judges and juries that would be adverse to builders. It is also pointed out by the Home Secretary that the Factory Act makes it obligatory on persons undertaking building operations to report to the local inspector of factories all accidents to persons employed by them on buildings on which any structural work is being done with the aid of machinery, or which exceed 30 feet in height and are being constructed or repaired by means of a scaffolding, if either the accident is fatal or disables the person injured on any one of the three working days next after the accident from working at least five hours. By section 167, "any premises on which machinery worked by steam, water or other mechanical power temporarily used for the purpose of the construction of a building or any structural work in connection with a building" is taken to be equivalent to a factory. There is no definition of a "building" in the Factory Act, and temporary premises may be regarded as one. But apparently such a building must exceed 30 feet in height. There is much doubt on the subject, and nobody engaged in building will desire litigation in order to ascertain the significance of the phraseology. It is evident, however, that by bringing buildings in an indefinite way under the operation

of the Factory Act there is a new field opened of wide extent for the employment of lawyers.

WE have so often referred to the new church which the Curé of Montmartre is erecting in Paris, we may be allowed to refer to it again, as there is another phase in its history. It will be remembered that as the site of the building is a short distance from the street, the Rue des Abbesses, the usual formality of lodging plans and obtaining the approval of the Municipal Council was not observed. The crypt and nave were constructed of what is called *beton armé*. After the fall of the bridge at the great Exhibition, in which a similar material was used, the Municipality intervened and the Prefect of the Seine ordered a demolition of the building. Instead of complying with the order the Curé made formal application for permission to erect the façade and the belfry. It is needless to say the application was refused. An appeal was next made by him to the Minister of the Interior, who has just given the necessary authority to complete the church with the belfry. It is, however, assumed by some that the Minister's order can only relate to the belfry, and it is not impossible that further litigation may arise out of the failure to carry out the order of the Prefect.

THE announcement that sufficient money has not been received to enable the committee to undertake any fresh exploration in Crete will cause much disappointment among archaeologists everywhere. If possible Mr. A. J. EVANS will finish the Knossian Palace, but Mr. D. G. HOGARTH is compelled to relinquish his projected excavation in the island. The success which was attained by Mr. EVANS was, it might be presumed, enough to encourage people who were dubious about the aptitude of English explorers to support the efforts of the Cretan committee. No more interesting work was performed by the representatives of any other nation, and a new idea of ancient architecture was inspired by the revelation of the palace of MINOS. It means were forthcoming there could be no doubt that much else would have been brought to light of no less importance. Besides, we have some claim on Crete. A great many years ago Professor COCKERELL had examined several parts of the island, but he was unable to make excavations, and all his speculations therefore related only to what he saw on the surface. There is now competition between various nations, and it will be unsatisfactory if after attaining so much success, we allow the work to be completed by Germans or Americans.

It is pleasing to learn that a memorial of JOHN RUSKIN will increase the interest of Westminster Abbey, although it is only in the form of a medallion by the late ONSLOW FORD, and has been fixed high above the bust of Sir WALTER SCOTT. As a poet, a moralist, an essayist and, we might add, as a theologian, although not entirely in accordance with the orthodoxy of the Dean and Chapter, JOHN RUSKIN deserves to have his name inscribed among the rather miscellaneous assemblage of Poets' Corner. But there is something satirical in the fact that the small portrait of a man who lavished a large fortune in an attempt to better the condition of his countrymen would not be allowed to be set up in the Abbey without the payment of 201/ 1s., by which the cost became no less than 460/ 9s. 11d. It appears, however, that in such cases it is usual to pay a guinea to the clerk of works and 2000/ to the Fabric Fund. The Chapter say the preservation of the building is so costly they have had to suppress a canonry, in order that the rent derived from the canon's house may be applied towards the payment of the debts. Consequently high fees have to be paid for memorials.

## BELFAST ARCHITECTS AND THE CORPORATION.

THE following petition against the Bill, promoted by the Belfast Corporation, praying to be heard by counsel, has been lodged:—

To the honourable the Commons of the United Kingdom of Great Britain and Ireland in Parliament assembled. The humble petition of Thomas Drew, Knight, as president of the Ulster Society of Architects, on behalf of the said Society, and also of the said Thomas Drew and all other the signatories hereto, being members of the said Society, or owners of landed property in the city of Belfast, sheweth as follows:—

1. A Bill (hereinafter referred to as the Bill) has been introduced into your honourable House, entitled "A Bill to empower the lord mayor, aldermen and citizens of the city of Belfast to purchase lands for purposes of a public hall; to dedicate ground for hospital purposes; to amend several of the local Acts in force in Belfast, and to confer various powers on the Corporation."

2. The preamble of the Bill, amongst other things, recites that the lord mayor, aldermen and citizens (thereinafter called the Corporation) of the city, acting by the Council, is the Urban Sanitary Authority for the district thereof; that it is expedient that the various powers referred to therein should be conferred on them, and that the other provisions contained in the said Bill, and not specifically set forth in the said preamble, should be made.

3. The said Bill is divided into nine parts, of which Part V., being one of the matters not specifically set forth in the said preamble, and to which this petition relates, is entitled "Elevation of Buildings."

4. The Bill prejudicially affects the rights and interests of your petitioners, and your petitioners object thereto.

5. The Ulster Society of Architects, the president whereof is your petitioner, Thomas Drew, the vice-president, your petitioner, William John Gilliland, and the secretary, your petitioner, Nicholas Fitzsimons, consists of your said petitioners and about forty other members, and is affiliated to the Royal Institute of Architects, Ireland, which is itself affiliated to the Royal Institute of British Architects.

6. The names of the signatories hereto, who are members of the Society, are distinguished by the letters M.U.Soc.A. being attached thereto.

7. The members of the said Society practise their profession in the city of Belfast, and are injuriously affected by all acts tending to fetter, interfere with, or curtail the free exercise of their profession in the said city of Belfast, which would have the effect of causing financial loss to and hindering the artistic progress of them and their profession.

8. Your petitioners' Society, as the local representatives of the parent Royal Institute of Architects, Ireland, takes upon itself as part of its duty the obligation of tendering to the Government and the Belfast Corporation its advice on all matters relating to architecture and building generally in the city of Belfast. The advantages to the city of Belfast of having a body of experienced and independent men ready and willing to give advice on all matters requiring long experience, local knowledge and great technical training is obvious, and it has been the practice of the Government and other municipalities to seek advice of the Royal Institute of British Architects (to which the Society is, through the Royal Institute of Architects, affiliated), notably in the case of the London Buildings Act, 1892 (58 Vict. cap. 213).

9. Early in the month of November 1901 your petitioners' Society learned from the usual advertisement that the Belfast Corporation were about to petition your honourable House for a Bill to confer on them powers relating to buildings in the city of Belfast, the nature and extent of which the said advertisements did not disclose.

10. On November 5 the secretary of your petitioners' Society was directed by the Council, and accordingly wrote to the Corporation of Belfast, offering the assistance of the said Society in drafting the clauses in the proposed Bill relating to buildings; the offer was ignored, and the Society was merely informed that the Bill had not yet been drafted.

11. Early in December the Council of the Society learned officially that the clauses of the Bill were coming before the local committee of the Corporation on December 5, 1901. The Council of the Society caused their secretary to write to the Corporation asking for a draft of the proposed clauses, and in reply they were informed that a copy would be sent as soon as printed; no copy was, however, sent.

12. On December 13 the Council of the Society learned officially that the clauses of the Bill were to come before the local committee of the Corporation for final settlement, and thereupon a deputation attended and asked why they had not been favoured with the draft clauses, pursuant to the promise made them on December 6, 1901, and were informed the promise was to send them a copy of the Bill when ready for distribution to the public; this interpretation of the promise was at once repudiated by the vice-president of the Society.

13. Part V. of the said Bill to which this petition relates is as follows:—

(1) Every person who proposes to erect or alter the front wall of any building shall together with and in addition to the plan section and notice which are required by the existing local Acts of the Corporation to be lodged with the surveyor lodge in the manner and subject in all respects to the conditions prescribed by the said local Acts a drawing or drawings showing all the elevations of such building overlooking any street or streets in which such building is proposed to be erected or altered. There shall be specified and shown on such drawing or drawings the height character and design of the building proposed to be erected or as proposed to be altered and the height of any buildings immediately adjoining the same and there shall be stated on such drawing or drawings the materials of which it is proposed to construct such elevations.

(2) The Corporation may disapprove of such elevations on the ground that the same are in their opinion objectionable or that in any respect they are not in conformity with the requirements or provisions of the existing local Acts or by-laws of the Corporation.

(3) The provisions of the said local Acts and by-laws shall so far as applicable for the purposes of and not varied by or inconsistent with the provisions of this section apply mutatis mutandis to the matters referred to in this section.

(4) Any person aggrieved by a decision of the Corporation as to such elevations may appeal to the Recorder against such decision whose decision thereon shall be final.

14. A copy of the draft clauses was on December 14 supplied to the Society, and on December 16 the Corporation met to consider the Bill, when a deputation of the Society attended and stated that the substitution of "The Corporation" for "The Surveyor" in said Part V. as the primary authority made it if possible more objectionable.

15. The Society were now informally invited to propose alternative clauses, but refused to do so, as on reading and duly considering Part V. of the Bill as furnished to them they considered it too vicious in principle to be capable of any amendment short of actual abandonment of the cardinal principles.

16. In consequence of the strong protest of the Society, at a meeting of the Corporation held on December 31, 1901, a minute was made that the entire of Part V., save so much thereof as related exclusively to the height of buildings, should be eliminated from the Bill.

17. Believing that the Bill would be altered pursuant to the said minute, the Society, acting in accord with the resolution of the R.I.A.I., passed on January 6, 1902, drafted on the model of the London Building Act certain modifying clauses, whereby the arbitrary and dangerous discretionary powers sought for by the Corporation could be controlled within reasonable limits and the vested rights of their profession and property owners duly safeguarded.

18. The proposed new clauses, printed in parallel columns with the corresponding clauses contained in the said London Building Act and copies of the same, together with the resolution of the Royal Institute of Architects, Ireland, were duly forwarded to the members of the Corporation.

19. The Council of the Society are informed and believe that these modifying clauses so submitted to them were never even considered by the members of the Corporation, though duly received by them.

20. The Council of the said Society having learned that the said Bill, possibly by reason of its having been deposited prior to the said meeting of December 31, was in its most objectionable form, the portions of Part V. relating to matters other than height not having been eliminated, and that no provisions limiting the arbitrary powers as to height had been introduced into the Bill, and as no guarantee was given by the promoters that these alterations would be made in the Bill at the instance of the promoters, the Council of the Society instructed their secretary on January 25, 1902, to write to the Corporation asking for a guarantee that the portions of the clause affected by the said minute should be struck out of the Bill, and that the provisions as to height and the constitution of the Court of Appeal should be modified according to the suggestions of the Society, and in the event of the Corporation desiring to alter the suggested clauses, that all alterations in them should be notified to the Society one week before the Bill be read a first time.

21. Beyond a notification of receipt, no reply to this letter was up to January 31 received by the Society, when, notwithstanding the said minute of the Corporation and the protests of the Society, the Bill as deposited was read for the first time.

22. At a general meeting of the Society, duly held on February 6, pursuant to resolution passed at a special meeting held on January 23, 1902, it was unanimously resolved that the Society should forthwith petition against the Bill.

23. Those of your petitioners who are architects most respectfully submit to your honourable House:—

(a) That the powers sought for by the said Part V. of the said Bill are not in accord with precedent, and are not required by the exigencies of the public weal.

(b) That they would most injuriously affect the rights and interests of the profession to which your petitioners belong, and which they practise in the said city of Belfast.

(c) That even if Part V. of the Bill be amended by the promoters pursuant to the said minute, the clauses would still, without proper safeguarding provisions, most injuriously affect the profession to which your said petitioners belong.

(d) That they are in full accord with, and, to avoid prolixity, rely on the objections hereinafter contained and submitted by such of your petitioners as are owners of house or landed property in the city of Belfast.

24. Those of your petitioners who are owners of houses or land in the city of Belfast also humbly submit to your honourable House:—

(a) That the proposed clauses forming Part V. of the said Bill would work an unprecedented and unwarrantable interference with the rights of private owners.

(b) That the same might be used as an engine of oppression in order to depreciate property either in the interest of influential persons or for political or trade revenge.

(c) That the exercise of the powers asked for by Part V. of the Bill is quite uncontrolled by any restraining provisions, and rest on the very unstable provision of individual discretion, unfettered by anything but their own peculiar artistic taste, while the proposed appeal could not afford any reliable safeguard against individual eccentricity, inasmuch as the holder of the very responsible and onerous office of Recorder of the city of Belfast need not of necessity possess the requisite technical knowledge and artistic taste to constitute him a final court of appeal in matters which must be decided not on matters of law or fact, or the legal construction of documents, but solely according to individual artistic taste of possibly grotesque and distorted ideas.

(d) That they are in accord with the architects in submitting that even if the provisions relating to height are to be retained there should be safeguarding clauses, as otherwise, for inadequate reasons, private rights would be sacrificed and orders impossible of compliance with, by reason of ancient lights or other easements, might lead to endless litigation and expense.

25. The rights and interest of all your petitioners are injuriously affected by the provisions of the Bill contained in Part V., set forth and referred to, and the preamble of the Bill so far as it relates to such provisions is incapable of proof.

Your petitioners therefore humbly pray your honourable House that the Bill may not be allowed to pass into law as it now stands, and that they may be heard by themselves, their counsel, agents and witnesses against the preamble of the Bill, and such of its clauses and provisions as affect the rights and interests of your petitioners, or any of them, and in the event of the Bill being modified in support of the introduction into the Bill of such other clauses and provisions as may be considered necessary, and that your petitioners may have such relief on the premises as to your honourable House may seem meet.

And your petitioners will ever pray.

## UNIVERSITY TRAINING IN ARCHITECTURE.\*

THERE are various architectural topics that are the subject of perennial discussion, according as one's view leans, with natural bias, to one side or another in matters essentially many-sided. "Whether architecture is a profession or an art" is such a topic; upon it discussion—nay, controversy, both bitter and prolonged—has raged interminably; and, in England, at any rate, even serious division of counsel has resulted, with somewhat dissipated energy and hampered action for a time as a natural consequence. Closely allied is the question of the proper training for an architect during his period of preliminary studentship; what course will best fit him to do his best? It is a question, I venture to think, of somewhat vital concern to us in Canada. At present, as a people, we are neither very wealthy nor very powerful; we have not yet worked out our scheme of national education at all completely; it is not yet established as it should be, broad and harmonious, on really national lines; on the contrary, to one coming but new from Europe, it seems in too many ways seriously provincial in spirit and narrow in result.

In Toronto and in Montreal we have now in Canada two schools for the training of architects. Of the former, I naturally do not venture to speak in detail, standing in the presence of many who know it well and can speak with an authority in regard to it that I cannot claim. But I do not doubt that I am right at any rate in this, that in both we are still at the stage of "missionary effort" in our endeavour to promote the thorough training of young architects in the

Dominion. Too often our voices are but as those of one crying in the wilderness, where there are none that listen, whence architects do not come forth. In Toronto I do know exactly how the matter stands at present, but in Montreal, during the five years that I have been at McGill University, encouragement and discouragement have been fairly evenly commingled. Personally, however, I have had the deeply interesting experience of organising from beginning and planning out the lines of development for the will, I trust, prove a sound and stimulating school of training in architecture on broad university lines of education.

In so many-sided a field as architecture, which is, it seems to me, an art and a profession both, and, perhaps, something more besides, there is room for many kinds of activity and many types of mind. To one the solution of problems of construction, with the extraordinary wealth of mechanical resources at the disposal of the modern constructor, is the side of architecture that appeals most strongly; to another, it may rather be the problems of social interest, the housing of the people, the proper provision for the caring of the sick in hospitals, even the progress of sanitation, and the realisation of its laws and their requirements; to some it is the nice adjustment of plan and interior arrangement; to others it is the wider field of the composition and design of buildings as a whole, and the joy of seeing thoughts take concrete form, as they are realised in actual execution.

It is significant this many-sidedness of architecture, and justifies in a measure its claim to be at once the broadest of arts and the foundation of the rest. It brings the architect into touch directly with almost all the other arts, professions and handicrafts, from sculpture and painting to law and medicine, and to industries of very many sorts.

And the training for the architect must be broad to correspond, if he is to be adequately fitted for his work. He cannot, of course, prepare him to the extent of endowing himself with all the knowledge in all the branches that he may, in the course of his practice, require to master and make use of; that is out of the question, but it should lay the foundation for such acquirement by training the mind to grasp readily the dominant factors in the problems that ask for their solution in well-balanced and harmonious architectural design.

Of the many and varied qualifications that go to make a successful architect in practice, some are of the distinctly practical type, such as business aptitude, faculty of organisation and attention to practical detail, while others are distinctly of the theoretical and academic type; most notably this true power in design.

Between the two comes construction and engineering, leaning now to the more practical, now to the more academic side, according as it is the more ordinary, rough-and-ready customary building or the altogether higher work of the scientific constructional engineer. That this last requires mathematical and scientific training, and is a fitting subject for university instruction, surely needs no argument or proof. The enormous advances made in but recent years in modern steel construction especially are, I suppose, for the most part, the direct result of such scientific study and research. But we accept this main rough division into the two sides, the practical and the academic, for the former class let it be at once conceded that the best preparation is the actual stress of day work at the office desk, and the experience that is only to be gained by study at first hand in closest touch with building in course of actual execution. Nothing can ever take the place of such practical training, which must always remain an absolutely essential part of the preliminary equipment of the architect. No plea for academic education is ever intended to lose sight of this; nor is it the case that for this practical training academic education is either specially adapted or required.

But while those who urge so strongly that your architect must be "a practical man" are not by any means beside the mark, that contention by no means covers the whole of the ground of an architect's education; it does not touch what, after all, if I may be allowed the phrase, the truly architectural side of architecture. It is doubtless in the ordinary relations of life—though I am not quite sure that I ought to qualify the relations of architect and client as always "ordinary"—a matter of great personal convenience to be on this eminent practical footing, obviating friction and promoting smoothness that may almost be prosaic. Heaven forbid that I should fully endorse the eminent desirability of being "a practical man."

Even the staunchest advocates of practicality, however, will admit that a great monument of architecture is not to be measured ultimately by the business capacity of its design, but by some other and higher quality altogether. Jacob Sansovino is said to have miscalculated the roof for the famous library of St. Mark's at Venice, and to have spent a time in gaol as the result. While languishing there he doubtless came to hold a very exalted appreciation of the practical advantages to an architect of being practical; but we, and the majority

\* An address delivered at the annual meeting of the Ontario Association of Architects by Professor S. H. Capper.

thousand travellers who know nothing, perhaps, of Sansovino's tedious time of incarceration, for whom the library of St. Mark's is one of the buildings that make the Renaissance architecture of Venice so fruitful and delightful a study, are apt to think less of the "practical man" than of the brilliant artist and designer who has left us so impressive a monument of his genius and skill.

The pre-eminent quality of architecture is in truth design, and this power of design is the vital touchstone of the greatness of an architect. It is in virtue of design and composition that the great buildings of the past, differing utterly, it may be, in point of architectural style, yet, one and all, appeal to us in varying degree. Historical associations may, of course, affect greatly, and other considerations, too, may have to be allowed for in our appreciation; yet, architecturally appraised, all buildings owe their fame in chiefest measure to this power of composition and design. The same is true of our modern work. It stands to reason, therefore, that anything that will foster and quicken power of design must tend to the best equipment of an architect for his life's work.

For design I venture to claim that academic training is the best road—for most, at any rate—to the achievement of success; that in no other way can the student readily obtain the grasp of the subject, the breadth of view necessary to attain to the best use of the power that may be his. Design is the expression given to a building; if consistent, convincing and harmonious the building will have dignity and the incomparable quality of style. Slipshod designing will mar any building and make it commonplace and lacking in distinction. With design, then, the architectural student's preparation should begin, and with design it should continue to the end, not, of course, to the exclusion of other necessary studies, but in conjunction with them. Design, it seems to me, should form the basis, the backbone (so to speak) of his course of study from the earliest moment possible, and around it the rest of his subjects should, so far as possible, be grouped. And I use my plea for university training for architects precisely on the ground of the pre-eminent importance of training in design, and upon the special facilities a university course affords for carrying out such training consistently in the fullest measure.

Nay, I do not hesitate to go still further, and to argue that the chief objection usually urged against academic preparation for professional life, the objection, namely, that it is "unpractical," is not in itself a disadvantage in this particular connection. In studying out an architectural design, in developing his ideas so as to bring out of them the best result he can, the student must, at the outset at any rate, be left as little hampered as possible by fettering limitations, such as economy of cost, restrictions and inconveniences of site, &c. The object of his study is to teach him to think architecturally, and to express his thoughts suitably and with grace of diction in the language of his art, to mould them into form that shall be purposeful and fitting as well as beautiful and gracious.

It is by no means an easy alphabet to learn; like any other language, if I may pursue the metaphor, it takes long to master; it means no short apprenticeship in grammar and expression, for the artistic faculties are slow of development sometimes, and always require careful, even toilsome training.

My contention is that for such training no preparation, as a general rule, is more apt or better than that provided by an university course of education. It can offer a well-arranged and systematic scheme of education, such as cannot readily be equalled by any other training. Moreover, it can and does most especially develop the study of design, that being precisely the side of architecture that most lends itself to academic teaching; it thus lays special stress on what, in my view, is the central subject, the foundation of the whole, while it is precisely the subject most difficult of adequate and serious study under ordinary conditions, apart from such a systematic course. I cannot be acquired in ordinary office training, where a student, be he never so willing, can at best but "pick up" fragmentary fragments of the subject. In a busy office each assistant is bound to have his special work allotted to him, without reference to his own requirements as a student, or, if he is a beginner, all around him are too anxious to have him show that he can be of some use to them, to think of his own immediate studies as the matter of first importance to himself.

Travel and study are an alternative, but I do not think they are of the most effective service till a student has both learned what to see and how to see it; and both these require the previous training which systematic study of design best can give.

As against this academic instruction it has been urged that such a course of training will stifle genius—a charge which need not, I think, be very seriously refuted; no sincere education can so fail of its primary object, namely, to "draw out" the faculties and develop them, as to succeed in stifling the superior powers that we call genius; and, secondly, that it will tend to create a dead level of correct mediocrity, dull and wholly lacking the freshness of untrained spontaneity. This, too, appears to me hardly to need refuting. The efforts of untrained

spontaneity are not generally, I fear, much more successful in design than in painting or sculpture; in architecture they too often lead to a wholly unregenerate straining after originality that appeals successfully neither to reason nor to good taste. And academic training fully justifies itself, if it succeeds in making mediocrity less wayward, controlling its vagaries, and sparing us those frantic abortions in design that remain a lasting instrument—potent for evil—in vitiating public taste.

I would not be thought for a moment to speak slightly of originality; no gift can be more precious. But originality in architecture is not to be attained through the medium of blatant disregard of accepted forms of architectural expression.

It is rather, it seems to me, to be attained more modestly by absolute sincerity in design, coupled with, or rather dominated by, that rare gift, the imaginative power that naturally expresses itself in form or composition that is beautiful, not ugly. The French use the phrase "*voir en beau*," or "*en laid*," to express this faculty or its opposite. One man will "see," or realise to himself, a design under a form that naturally lends itself to beauty of line or mass or composition; in the hands of another, on the contrary, the same idea will be embodied under forms that are less pleasing, artistically not satisfying. But I cannot think that the former will risk any loss to this admirable faculty, if he seek to educate his powers along the lines I have endeavoured to suggest, while the latter may at least have the asperities of diction modified by familiarity with established and well-accepted forms.

Perhaps few great architects have shown more striking originality in design than Sir Christopher Wren in the wonderful series of churches with which he enriched London during nearly half a century after the Great Fire of 1666. Of them all the great cathedral of St. Paul's is assuredly his masterpiece, I suppose the most beautiful and imposing church that the Protestant faith has raised. Yet, in its final form, it is a triumph of academic discipline over daring, but not successful amateurish spontaneity. Those of you who are familiar with the design as originally approved—in King Charles's warrant it is declared to be "very artificial, proper and useful"—will recall the really grotesque design for the central dome. "A nightmare conception," it has been called, "of two domes and a telescope steeple." It is even surpassed in grotesque extravagance by an earlier scheme of Wren's for the reconstruction of Old St. Paul's, in which a dome was to be "surmounted by a huge open-work pineapple, 68 feet high, of monstrous and horrible design." Yet the dome of St. Paul's as actually erected is one of the most beautiful in existence, its most conspicuous characteristic being, as has been well said, "its magnificent sanity." The reason for this astounding aberration of England's greatest architect is probably simply the lack of academic training. Wren entered upon the practice of architecture as an amateur, and, genius though he was, he never wholly overcame his lack of preparation for his great career. In St. Paul's itself, for which the long series of London churches was Wren's very wonderful preliminary study ground, there are still minor blemishes, in spite of years of patient study—it is idle to deny them—that seem only the result of this want of training in Classical design.

Originality does not then, I take it, imply departure from traditional forms in architecture so much as honest, unaffected and gracious use of them in sincere application to the requirements of modern building. Hence it is that I do not give my adhesion to those who would try to cut themselves adrift from the architecture of past times in order to be "modern." Not from ignorance, but from full and critical knowledge of the past, can we create a tradition for the present.

It is idle to seek to evoke a "modern style" in the sense in which Gothic or French Renaissance were styles at different periods of French architectural history, when builders—both designers and workmen—were all familiar with certain current forms and methods, and were restricted to these alone. With our immensely fuller knowledge, we cannot be so restricted if we would. We can express ourselves in many ways in solution of the same problem, whereas in earlier times one current way only of expression was known, and therefore consistently practised. And modern architecture gains in this immensely fuller vocabulary, so to speak, if wisely not extravagantly used.

The historical study of architecture consequently forms the natural basis for architectural design. Only by knowing the best that has been done can we do the best that can be done to-day. Study of architecture in the past should not, if rightly guided, lead to mere archaeological copying or repetition in our work to-day; but it should, if its lessons are properly learnt and its teaching taken truly as our inspiration, bring home to us the best that past has done, and set before us an ideal that will serve us as both a standard and a stimulus to solve our modern problems as honestly and well.

Only out of full and loyal knowledge of past tradition can we to-day hope to achieve in our work results that will be as true and as expressive of our modern life.

In the course in architecture which I have had the privilege of planning out and developing at McGill University, I have sought to give effect to these conceptions.

The full curriculum embraces four years, of which the first is preliminary, devoted chiefly to mathematics, physical science and drawing, with the very useful addition of practical instruction in the workshops, designed to impart some knowledge of the nature of materials of construction, to familiarise the student with the more important tools, and to give him some manual skill in their use. Only in the second year is the more special work in the different departments of architecture and engineering begun with us.

In the first of the three remaining years the teaching is chiefly devoted to a rapid survey of architectural history from ancient Egyptian to modern times, touching successively upon the great eras of European civilisation and tracing the evolution of architectural styles in their constructional forms and methods.

The student is thus placed in touch, so far as may be, with the broad lines of his subject, and the present is linked with the past in continuous development. This, it seems to me, should have an important influence on the student's attitude; for, fascinating though the archæological side of architecture may be, it is not as archæology but as architecture that the modern student should regard it.

In conjunction with these historical lectures, a course on the elements of effect in architecture and the main principles underlying the two great divisions of architectural style, the Classic and the Gothic, naturally, I think, arises; for want of a better name I have called it elements of architecture. And from the first, so soon as the student has acquired a little familiarity with the more obvious means of architectural expression, such as the Classical orders (which remain, I think, the best primer, so to speak, the most reasonable and effective introduction to architectural form), he is set to express himself in elementary design of plan and building.

In the next year the historical course is devoted to a study in detail of the architecture of the Renaissance down to modern times, in amplification of the earlier general course, while both third and fourth year students take together the more special courses. These comprise detailed study of ecclesiastical, domestic and public architecture, the lectures still dealing with the historic evolution of architectural styles and with the problems and requirements of modern work. A course is also given upon general art history so as to place the architectural student in touch not only with the decorative details of the different styles of architecture, but also with contemporary forms in other branches of art, especially the decorative arts employed in building.

I have only mentioned the subjects bearing on design, as the central theme round which, in my opinion, architectural study can best be developed in an university course. I have perhaps spoken at too great length already of the work of my own department at McGill's University; if so, I again apologise. But I have said scarcely anything of that other side of architecture, construction, for which the scientific training of an university course offers very direct and effective preparation. For modern construction in its more recent progress touches engineering in its completeness of calculation and in its accuracy of design.

And, again, let me guard against the charge of disregarding the practical training needed. In an university course it is not possible, nor is it attempted, to supersede that side of training for professional practice which is only fully to be gained by practical employment in office and on works. This, the more business side of professional work, must always be learned in actual employment under the conditions obtaining in everyday life. And such practical knowledge of the work before him should, whenever possible, be acquired by the student concurrently with the higher training the university offers, by seeking, during his free months, employment in connection with works in operation or in progress of execution. This training is manifestly of the greatest importance for the complete equipment of the student. But, necessary as this practical training is, an university course can and does provide for something more, for a thorough grounding in the principles upon which professional practice is ultimately based, an education which can hardly ever be otherwise at all adequately acquired, but which, though too often lacking, is essential for attaining the best and highest work in architecture. In design and composition—the keynote of the art of architecture—success depends for the most part on the due training of the critical æsthetic faculties, and for such training the education offered in an university course is very directly and specially adapted; for most the surest, for many the only road.

Let me conclude, having thus in a sentence suggested these wider bearings of my subject, with a quotation from one of Oxford's greatest sons, which sums this up in words far more eloquent than mine:—

"An university training is the great but ordinary means to a great but ordinary end; it aims at raising the intellectual tone

of society, at cultivating the public mind, at purifying national taste, at supplying true principles to popular enthusiasm and fixed aims to popular aspiration, at giving enlargement and sobriety to the ideas of the age, at facilitating the exercise of political power and refining the intercourse of private life."

Is there any one of these great ends that should not be the goal of our profession, the aspiration of us all as architects?

## A ROMANCE IN FLINT.

TO the casual observer those few glass cases containing oddly-shaped bits of flint which have found a resting place at the Midland Institute during the conversazione week says the *Birmingham Post*, are not absorbingly interesting yet around them may be woven all the glamour of romance. There are students of nature and many whose intellect, whose observation, whose imagination has for years centred around such objects as these, to whom they form links with past ages almost immeasurably remote, the basis of theories as to the antiquity of man, fanciful in a great measure it may be, but nearly approximating to history one cannot say. These are the men who, spending their lives, in a sense, "exempt from public haunt," find "tongues in trees, books in the running brooks, sermons in stones." At the outset credulity is severely tested by the appalling figures with which some archæologists denote the antiquity of these vaunted evidences of man's handiwork. Their theories are not universally accepted by their fellows, yet they have at least the merit of picturesqueness and of human interest.

Nearly a quarter of a million years ago, they say, before the great ice age crept down and seared the face of our fair land, paralysing it for unnumbered æons in the grip of Arctic cold, there lived here a race of rude and hardy men. They were primitive savages in the fullest sense of the term. Their habits were simple, their wants few—they were but little higher in the scale than the beasts of the field. And yet there was in them the faint dawns of that intelligence which was slowly to lift them above themselves, to develop, as endless generations passed away into oblivion, the highly-intellectual and scientific civilisation in which we now have part. The record of their existence which they have left behind them is meagre indeed. These rough flints, rudely chipped into shape to serve domestic or warlike uses, are the only literature which has survived through the centuries in which we can hope to glean the story of their lives. Eolithic man is the general term which some of our latest antiquarians have applied to these remote peoples, these early stone-men, from "eos," the dawn, and "lithos," a stone. With palæolithic and neolithic man we are comparatively familiar, for they belong to later times, the times which preceded the copper, the bronze and the iron ages, which bring prehistoric humanity into close touch with us of to-day. Their relics are more conclusive and more readable, their skilful manipulation of stone to fashion weapons of battle and the chase admits of no question, and betokens a much higher standard of intelligence. Yet in such rude flints as a curious Birmingham public has inspected archæologists like Mr. Benjamin Harrison, of Ighite, Kent, and the Hon. Auberon Herbert profess to find just certain evidence of human handiwork as exists in relation to later periods.

Two hundred and forty thousand years may or may not be anything like a correct guess as to the antiquity of these relics. It represents a period of time which the human mind almost fails to grasp. We look back a mere couple of thousand years to the dawn of the Christian era. We note the march of civilisation, the nations that have risen and fallen again, the grandeur of Rome and of Spain which has passed away, the mighty world empire of our own which has come into being. We reflect that but a few short centuries since America, where now dwells a great, a new, a prosperous people, was unknown to the eastern hemisphere, and we reflect that 2,000 years is a long period in the history of humanity. Yet if these new theories are to be accepted, a hundred and more such periods have passed away since eolithic man lived his narrow life, found those rough flints, and rudely chipped them to his hand. Professor Geikie places the beginning of the glacial period 240,000 years ago, and thinks it lasted about 160,000 years ago. It was broken by milder periods during which these eolithic men returned to the haunts from which they had been driven out by the cold. At that time England was joined with the Continent, and the great ice sheet travelled down, it is believed, as far as the latitude of London. Controversy upon the question of the so-called evidence of eolithic man has raged around two points—first, to whether or not the flints show conclusive traces of man's handiwork; secondly, as to the period in the world's history which they are to be assigned. Geikie, Godwin, Austin and Boyd Dawkins believe the gravels in which they are found to be pre-glacial or inter-glacial, while other authorities declare them to be post-glacial.

is in the extensive gravel pits of Hampshire and Kent the stones, of which specimens are included in the collection referred to, have been found. They consist largely of what are known as body stones, chipped away so that concave surfaces are formed, and the theories of Mr. Harrison and the Hon. Auberon Herbert are largely founded upon the fact that these stones are used at the present time by primitive savages in the African and Australian interiors. These tribes are in the habit of scraping their bodies after violent exercise, and of scraping the soles of their feet. As a result of continually walking shoeless, the skin on the soles of the feet becomes thick and cracks, and corns develop if the feet are not kept in condition by this primitive practice. The flints discovered in England were shown to several explorers who had recently returned from these remote regions, and were at once recognised as being identical with the African and Australian body stones. Arguing along parallel lines, the theorists point out other uses to which the stones were put consisted in the making of wood, bones and other like materials in order to use and point them as weapons. In the course of geological ages and upheavals extending over thousands of years, the flints would naturally come in for much grinding and breakage; but it is from the particular character of the chips that the theory of man's handiwork is deduced. Its supporters point out that exactly similar effects are produced at Ringwood by the knappers, who, by means of modern hammers and anvils, chip off the flakes from pieces of flint so as to fashion them for use in flint guns, which are still manufactured for distribution among semi-savage tribes. They try to find a clear distinction between such mechanical workings and the breakages which the flints would undergo in the course of geological changes. Of the remote races which we have known these eolithic men, of the cave and drift men who are associated with the palæolithic and neolithic ages, much more is known. There are specimens of their work, of stone spear heads, of fossilised bones undoubtedly fashioned to suit human necessities in many of our museums, all going to support the accepted evidence of the existence of these tribes.

The Hon. Auberon Herbert's theory of totemism among primitive man is no less picturesque, and no less strongly refuted by some archaeologists, while many others retain an open mind towards it. From those same gravel drifts this gentleman has collected hundreds of flints, small and large. They are all of the same size, he says, and the beds are literally full of them. To any observer these stones are as commonplace and unsuggestive as the others, but Mr. Herbert finds in them the household gods of primitive man. To him they represent birds, beasts and fishes, pyramids and mountains, even the sun, the moon and flame; and each object, he tells us, probably formed a tribal, the family, or the sex totem. Through all the imaginative ideas and suggestions which he weaves around the rough flints it is hard to follow him. The basis of his theory lies in the savage belief that in everything, animate or inanimate, concrete or abstract, there is a separate and divisible entity.

"To the savage," he says, "the world of nature and the world of soul are inseparably intermixed. They touch him at every point, and it is to the spirit forces around him that he owes a large part both of the good and the evil of his life and his nature, his cherished memories, his softer and more sensitive feelings, his search after secret wisdom, and at the same time the invented sufferings and fantastic terrors that he endures, and the cruelties that he commits." That totemism is a dominant influence upon the savage peoples of the world there can be no doubt. It is very much akin to the idolatry which marks a higher civilisation, and in this fact Mr. Herbert finds the strongest arguments in support of those romantic theories which he weaves around his Hampshire flints. The question has at any rate a human interest. Whether or not these discoveries will demolish or confirm such imaginative theories remains to be seen.

The scepticism with which they have been received by the author's opponents in the field of archaeological research cannot be better indicated than by a brief statement of the views of Mr. William Dale, F.S.A., F.G.S., hon. secretary of the Hants Field Club and Archaeological Society. Mr. Dale writes:—"I do not say there is no basis in fact for what Mr. Herbert has written, but I do assert that the only foundation for his generalisations is to be found in the varied and curious uses to which flints will assume through transportations and accumulations, through their internal structure, and the circumstances they contain and around which many of them were used. The amount of rough usage that lies between the time when a flint was dislodged from the chalk in which it was embedded until it was laid to rest in a gravel bed is enormous. There are the crushing and breaking effects of transport—the only effects. Flints are of unequal hardness. Chemical changes take place in them. They will burst and flake to pieces as they are heated. They contain much water, and frost will not only shiver them, but make in them cup-like depressions or hollows. Many flints were originally formed round branching corals, sponges and other organisms, the fantastic shapes of which

they take. Mr. Herbert is not the first who has seen strange forms in broken flints. The men who dig gravel here and bring me palæolithic instruments sometimes tempt me with such objects as a monkey's face or a frog's head, which can be explained by a fossil organism or the cup-like hollows of frost, assisted by the grotesque shape of the flint." So does this brother scientist pronounce his "Requiescat in pace" upon the pretty romances of his more imaginative confrère.

## ARCHITECTS' FEES IN AMERICA.

A CASE of importance to architects came up recently in the Supreme Court of Indiana. An architect contracted with a public board of commissioners to furnish plans and specifications for a certain building, and superintend its erection, for a certain percentage on the cost of the completed building. It was stipulated in his contract, says the *American Architect*, that the building should not cost more than a certain sum, and that he should make necessary changes in the plans and specifications without additional expense; and the contract also provided, presumably by implication only, that the architect should pay all loss or damage due to his own mistakes in preparing plans, specifications or contracts, or in superintending the erection of the building. After the original plans and specifications were made, the commissioners directed changes to be made which greatly increased the cost of the building, and the architect superintended its execution at the increased cost. The question before the Court, which was decided unfavourably to the architect by the Court below, was whether under his contract the architect was entitled to a percentage on the extra cost of the building over the sum originally stipulated. The Supreme Court reversed the decision of the lower Court, and held that the architect was under the circumstances entitled to his percentage on the entire cost of the building as finally completed. The attorneys for the commissioners thought that it strengthened their case to claim that the contract with the architect was illegal under a statute forbidding "commission or percentage contracts with State or county officers," but the Supreme Court held that the case in question was not within that statute.

## YORK MINSTER.

A PAPER was read by Mr. George Benson before the members of the York Architectural Society on "York Minster." The president (Mr. C. H. Channon) occupied the chair, and there was a large audience.

Mr. Benson said the pilgrim of old, with his staff and wallet, or the pedestrian of to-day, on approaching York was only able to recognise the city in the distance by its cathedral. It was the Minster that denoted the city; the sight of it inspired hope in the tired traveller, and enabled him to persevere until he had entered the gates of the capital of the North. From the city walls the Minster was seen high above the houses and parochial church towers and spires. The Rolls of Edward I. record the Minster Close as being the nightly resort of those whom we now term Hooligans. So, for the prevention of nocturnal incursions of thieves in the streets and lanes in the said precincts, a license was granted on May 18, 1285, to the Dean and Chapter of St. Peter's, York, to enclose the churchyard and precincts of their church with a stone wall 12 feet high for the better security of the canons. In view of the approaching coronation of King Edward VII. it was interesting to note that Archbishop Aldred crowned Harold and also the Norman Conqueror. York then rebelled against William I. and a terrible fire took place which damaged the Minster. Thomas, treasurer of Bayeux, when appointed Archbishop of York, set about to repair the Minster and to reorganise the clerical staff. To the west of the edifice he erected a new church, consisting of nave with aisles and aisleless transepts, each having an eastern apsidal chapel. The old church was restored and used as the choir. When Archbishop William died the Minster had no saint of its own, and in 1227 Archbishop Walter de Grey and the Chapter pleaded the Pope to enter William on the calendar. Pilgrims then came from all parts to visit the saint's tomb and to make offerings. In June 1221 Alexander, king of Scotland, was married in the Minster to the sister of the English monarch. The presence of royalty and the miracle-working saint demanded a more glorious edifice for the worship of the King of kings. A rebuilding was contemplated, planned on an immense scale, and very soon new transepts were commenced, exceptional in height and breadth. After tracing the interesting history of the Minster down to more modern times, Mr. Benson, in conclusion, said:—Generation after generation of our citizens have worshipped within the walls of the Minster. To each successive age the stones of St. Peter have re-echoed with the Gospel story. The Minster of St. Peter is of hoary antiquity; a venerable

able church with a continuous history of no less than 1275 years. From a lowly wooden building erected in 627, it has culminated in the magnificent structure completed in 1472. For 430 years this building has been the glory and pride of York. May the sons and daughters of old Ebor cherish the vast heritage that has come down to them, and likewise pass it on in perfect condition to their descendants.

### THE GRANT BOULEVARD, PITTSBURG.\*

THE main part of the city of Pittsburg is built on the wedge-shaped piece of land lying between the Allegheny and Monongahela rivers, where they unite to form the Ohio. The central portion of this land consists of a range of high hills which commences at Smithfield Street, at a distance of about one mile from the junction of the two rivers, and rises rapidly to an elevation of nearly 600 feet above the rivers, leaving a narrow and comparatively level strip of ground on the bank of each. Along these narrow strips of land are located all the railroads which enter the city from the east and north-east, as well as the main thoroughfares which connect the business portion of the city with that occupied by the residences and with the eastern suburban districts.

These main thoroughfares number only five and are all narrow, none of them having a roadway of greater width than 36 feet between kerbs. Each has two street-car tracks, which leave only room enough for one waggon between the rails and the kerb. These narrow roadways are only sufficient to provide for teams, delivery waggons and similar traffic, and the use of carriages and pleasure vehicles on these streets is not only impracticable, but sometimes dangerous.

Mr. E. M. Bigelow, formerly director of the Department of Public Works, observing this condition, realised that at the rate the city was growing and traffic was increasing all of the existing avenues between the residence and business sections of the city would in a short time be taxed to their utmost capacity by the street car and waggon traffic alone, and that the use of carriage and passenger vehicles on these streets would have to be given up entirely. He therefore asked the city Councils to authorise the construction of a new driveway along the north face of the hill between the two sections of the city, and to reserve this driveway for the exclusive use of carriages and light vehicles. The necessary measures having been passed by the city Councils in the spring of 1895, Mr. Bigelow, assisted by Mr. W. R. Browne, superintendent of the Bureau of Engineering and Surveys, and Mr. W. S. Wakefield, assistant engineer, made the surveys for such a driveway and the Grant Boulevard was located, beginning at Seventh Avenue, near Union station, and following the face of the hill parallel with the Pennsylvania Railroad to Centre Avenue, near Bellefield Avenue.

On August 10, 1896, a contract for the construction of the drive was let by Mr. Bigelow to W. E. Howley & Co., but before the work was started the contract was transferred to Werneburg, Sheehan & Co., who broke ground October 28, 1896.

The boulevard, which is 15,407 feet long and 60 feet wide, consists of a roadway 40 feet in width and two sidewalks, each of which is 10 feet wide, constituting a direct and much needed avenue between the business and residence sections of the city.

The face of the hill along which the boulevard is constructed was very steep for a distance of nearly 2,000 feet east of the Union station, being almost vertical. This consequently materially increased the expense and difficulties attending the construction, necessitating very heavy cuts, in some places 70 feet deep, and the construction of nearly two miles of heavy retaining walls, one of which is over 60 feet high and another one nearly a mile long.

The retaining walls are built of heavy rubble below the ground and above the ground of heavy ashlar backed with rubble. Over a mile and one-half of wall is furnished with a parapet capped with a cut coping, the top of which is 3 feet 8 inches above the curb grade. For a distance of some 1,500 feet near the west end the retaining wall extends down to the top of the slope wall of the Pennsylvania Railroad, forming a heavy masonry facing for the hill, over 80 feet high in some places. The retaining walls are constructed principally of Beaver sandstone, with the exception of the parapet, coping and some of the ashlar, which are of Cleveland sandstone. The parapet and all ashlar are laid in Portland cement mortar, and the backing in Louisville cement mortar.

The greater portion of the deepest cuts was through rock of a shale formation, very much broken by seams of clay, which, when exposed to the action of the elements, softened and caused considerable annoyance by land slides, one of the most serious difficulties encountered in engineering works of

this class in western Pennsylvania. The excavation exceeded the fill by about 100,000 cubic yards, which was loaded on the Pennsylvania Railroad at the foot of the hill by mechanical chutes and dumped beyond the city limits.

Each side of the roadway is furnished with a 6 by 24 cut curb of Beaver sandstone, the top of which is 6 inches above the gutter, which is built of six rows of Ligonier stones along each curb, the joints between the stones filled with paving pitch and gravel. The remainder of the roadway, 35 feet in width, is paved with Telford macadam crowned 10 inches, consisting of a foundation of 2 1/2 inches deep and two courses of broken stone, each of which is 4 inches thick, with enough screenings on top to bind the broken stones, making the thickness of the completed pavement 16 inches. The Telford foundation is of native Pittsburg sandstone 8 inches deep, from 4 to 6 inches wide and 6 to 16 inches long. The crushed stone and screenings are of Ligonier stone, the first layer being broken to 1 1/2 to 2 1/2 sizes, and the top layer, forming the wearing surface, to 2-inch sizes. The screenings are of sizes varying from 1/2 to stone dust. Each course of broken stone was thoroughly compacted by a liberal use of water and a 10-ton steam roller.

Most of the material used on the work was delivered by the Pittsburg Junction Railroad, at the foot of the hill near the eastern end of the boulevard, and hoisted up the hill over an incline built for that purpose. Thence it was delivered to the required on the line of the work by means of a temporary narrow-gauge railroad, which the contractors constructed the full length of the boulevard.

The accompanying copy of the final payment will materially in forming some idea of the work attending the construction of this highway. The high figure for extra work is principally due to the land slides, which necessitated considerable work not covered by the contract.

#### Total Estimate of Grant Boulevard.

Items.	Quantities.	Rate.	Total.
Grading	377,103 cubic yards	\$ .37	\$139,521
First-class masonry	61,058 "	7.50	457,935
Rubble masonry	1,569 "	6.00	9,414
Concrete	1,324 "	6.00	7,944
Sewer pipe, 24-inch	1,286 lineal feet	2.50	3,215

### VIBRATION ON LONDON ELECTRIC RAILWAYS.

WE understand, says the *Times*, that the committee appointed by the Board of Trade in January last year inquire into the vibration produced by the working of traffic on the Central London Railway, have presented their report to Mr. Gerald Balfour. As a first step the committee satisfied themselves by personal observation that vibration sufficient to cause serious annoyance is actually felt in many of the houses situated along the course of the railway. Exhaustive experiments, entrusted to engineering experts, were then carried out with a view to locating the origin of the trouble and to discovering a remedy. After carefully weighing the evidence placed before them, the committee decided to recommend the adoption of a type of locomotive or motor car which the load not carried on springs is reduced as far as possible. This, the report explains, may be arrived at by using gearing as in the geared locomotives or motor cars, or by using a gearless locomotive in which an electric communication is employed between the driving axle and the motor, but the committee had no opportunity of experiment with a locomotive of this type. In the trials carried out with motor cars were found to have an advantage in freedom from vibration over the geared locomotive. So far as the Central London Railway is concerned the committee are confident that by adopting motor cars in place of the ordinary locomotives the vibration produced by the running of the trains can be reduced so as to cause no serious annoyance, although it is possible that the sound of the trains may still be detected especially in the night.

The report proceeds to state that the committee are able to speak positively as to the motor cars, but they have little doubt that any method of driving in which the unsprung-borne load on each axle is reduced to a similarly small quantity might be used with impunity. They are disposed to prefer a still

\* By John Brunner, superintendent, Bureau of Engineering and Construction.

than that in use on the Central London Railway, and they think that in new undertakings sufficient room should be allowed for the introduction of a deeper rail; but they are of opinion that without altering the permanent way of the Central London Railway the change of motors which they recommend will effect a practically complete cure of the disturbance complained of. It may be added that, in order to ascertain whether a specially severe disturbance could be connected with particular trains on the Central London Railway, the committee instituted elaborate observations in which ten or twelve observers were stationed in various houses and recorded during the whole of the day the times of passage of the trains and the estimated intensity of the vibrations. A comparison of these records with records made at the stations by other observers of the precise times of starting and arrival of the various trains showed that it was a matter of chance whether a given train caused a light or a severe vibration; (b) that trains causing a severe vibration in one house were as likely as not to cause only a light vibration in the others; and (c) that different rooms in the same house were not similarly affected by the same train. The report is signed by Lord Rayleigh (chairman), Sir John Wolfe-Barry and Professor Ewing.

### LEEDS NEW WATERWORKS.

**DESCRIPTION** of the Leeds waterworks, with special reference to the scheme recently sanctioned by Parliament for the extension of the undertaking, was the subject which engaged the attention of a well-attended meeting of the Yorkshire College Engineering Society on February 10, the lecturer being Mr. E. J. Silcock, M.Inst.C.E., of Park Row, Leeds.

The lecturer, whose remarks were illustrated by maps and diagrams, reminded his audience, says the *Leeds Mercury*, that prior to 1837 the water supply of the city was pumped from the River Aire in the neighbourhood of Leeds Bridge, and a water-wheel, the framework of which was still in existence, was used to develop the necessary power for the distribution of the water to the population. It was hardly necessary, he thought, to say that the source from which this water was obtained was now and had for some time been totally unfit for the purpose of drinking.

Proceeding, he described the formation of the Leeds Water Company, and the subsequent taking over of the works by the Corporation in 1852. He also described in some detail the extension of the works in the Washburn Valley, the drainage area of which, he said, was 22,000 acres. The area above the bankment of the Swinsty Reservoir, from which the supply to Leeds was taken, was 17,047 acres, the available supply of water from the valley being 18½ million gallons per day. At the present time the consumption of water in Leeds was at the rate of 16 million gallons per day, and it was the nearness with which the actual consumption approached the available supply that rendered it necessary for the Corporation to secure powers for the construction of additional storage reservoirs in the valleys of the Burn and the Laver. The present waterworks of the Leeds Corporation in the Washburn Valley were surrounded to the north and west by the gathering grounds of Bradford, Tadcaster, Shipley and other towns, while in the valley of the Skell the ground was also occupied by the Bradford Corporation, so that, excluding the ground already occupied by existing projected waterworks, there remained no area which could be utilised for the purpose of collecting water on any scale at all commensurate with the requirements of the city other than in the valleys of the Burn, the Laver and the Skell.

In estimating the quantity of water required, a consumption of 40 gallons per head per day was fixed upon as being probable within a short time. The present normal consumption in the country was 20 gallons per head per day; but Leeds was considerably above the normal standard, and the rate was increasing by 2½ per cent. per annum. The rate of increase in the consumption during the past decade in Leeds had been 175 per cent., while that in all other county boroughs outside the London area was only 13.25 per cent.

The problem to be faced was how to double the present supply of 18½ million gallons per day, and it was found that the valleys of the Burn, the Laver and the Skell would provide 24 million gallons. Harrogate, however, secured about 300 acres of the area, representing two million gallons, and owing to the opposition of the riparian owners, and particularly Lord Ripon the projected extensions in the Skell Valley were abandoned, with the net result that the increased supply of Leeds had been reduced to 15.6 million gallons per day. This would be collected in three reservoirs in the Burn Valley, known as the Colsterdale, the Leighton and the Healey reservoirs, with a total capacity of 4,086 million gallons, and two reservoirs in the Laver Valley, known as Carlismoor and the Verton reservoirs, with a capacity of 1,555 million gallons. These reservoirs, said the lecturer, would discharge into the

Swinsty reservoir by means of iron pipe aqueducts and a tunnel passing through the ridge dividing the watersheds of the Nidd and the Wharfe, and entering the Swinsty reservoir at a point 10 feet above the present top-water line.

Having dealt exhaustively with technical details of construction, the lecturer concluded by referring to the cost of the undertaking, the original estimate for which amounted to two and a half millions sterling, a figure which, for the modified scheme, has been reduced to 2,200,000.

### ARCHITECTURAL EXAMINATIONS.

**A**N architect having written to Mr. Seth-Smith for his opinion on an examination recently instituted by the Society of Architects, that gentleman has replied by the following letter:—

46 Lincoln's Inn Fields, London, W.C.:

February 3, 1902.

My dear Sir,—As to the Society of Architects, to which I at one time belonged, it had a mission, viz. that of calling the attention of the profession and the public to the need (in its judgment) of the legal protection of the title of "architect," and of compelling those who in future aspired to the calling to have gone through a proper and sufficient training.

The first principle the Council originally laid down was that the Royal Institute of British Architects was the proper examining body, and that in any Bill it (the Society) advocated the Institute should be the sole examining body for England. On these bases I supported the movement, for the reason that the Royal Institute of British Architects in their new charter had apparently ignored or abandoned this broader policy—the only policy which, to my mind, can secure to our profession its due status, or to the Royal Institute of British Architects its widest usefulness.

When, however, some eight or more years ago the Society of Architects launched a scheme for examinations of its own, after using all my powers of persuasion to no avail, I was obliged to resign my membership, and I shall continue to oppose the policy it is pursuing by every possible means, excepting that I am, of course, as strong (and even stronger) an advocate of the legal registration of every properly qualified architect as ever I was, and am pleased to notice how rapidly the necessity for something of the kind is forcing itself on the minds of most architects.—I am, dear Sir, yours very truly,

(Signed) W. H. SETH-SMITH.

### Liverpool Cathedral.

**SIR**,—The promised statement by the Liverpool Cathedral committee "giving the reasons which induced the committee to finally select St. James's Mount as being in every way the most suitable" has appeared, but it cannot be said that the committee have provided any new facts or arguments. Their pamphlet chiefly consists of a mere reprint of the statements which have appeared in the Press from time to time, and which have been then shown to be incorrect and not at the time further contested; but the committee seem to be, for want of arguments, relying upon the proverbial forgetfulness of the public. They will probably discover that the memory of the public is somewhat longer when it concerns the subscribing of funds, and it does not therefore seem necessary to again rebut these statements.

It is, however, greatly to be deplored that the pamphlet of the cathedral committee should exhibit such a want of candour and straightforwardness. For instance, the value of St. James's Mount site is stated to be only "a little over 10,000*l.*" (i.e. the cost of raising the mound and laying it out many years ago, and not its present market value), whereas their own diocesan surveyor, Mr. Bradbury, has valued it at 20,000*l.*, and the Corporation surveyor, Mr. Shelmerdine, at 35,000*l.*, and both of these valuations are probably less by some 60,000*l.* to 70,000*l.* than the actual market value of the site and houses.

On the other hand, however, Monument Place site is stated to be worth over 200,000*l.* without trade compensations, although Mr. Bradbury and Mr. Shelmerdine have each valued it at 130,000*l.*, with 50,000*l.* for trade compensations.

Again, it is stated that there is a railway tunnel underneath the corner of Monument Place site, "which may prove a source of very great inconvenience," but no reference is made to the

fact that another railway tunnel is close to the St. James's Mount site, which, were there any real objection in either case, might prove an equal source of inconvenience. Another instance. The committee say that "it is only right that both sides of the case should be heard, and heard fully and impartially;" yet they requested the local Press to close their columns to a discussion of the subject, and that this has largely been the case can be clearly proved. One other example. The pamphlet suggests that the St. James's Mount site has been selected because it is the best, and not because it is cheap, though Lord Derby stated at the town-hall meeting in June last that its selection was due to motives of economy, and it is a fact that the cathedral sites committee reported that Monument Place site was the best, and recommended its adoption.

It will be a matter of surprise if the public is satisfied with the sorry answer which the cathedral committee have made to their critics, the strength of whose position is amply demonstrated and increased by the publication of the cathedral committee's reply.—I am, sir, your obedient servant,

T. MYDDELTON SHALLCROSS,

Hon. Secretary (pro tem.),

Liverpool Cathedral Petition Committee.

Bank Buildings, 6 Dale Street, Liverpool:

February 8, 1902.

### GENERAL.

**Mr. Francis Trollope**, late of Messrs. George Trollope & Sons, builders, has left property which has been valued at 78,951*l.* 19*s.* 5*d.*

**A Manager** is to be elected for the works department of the London County Council at a salary of 1,500*l.* a year.

**The Grand Palais**, in Paris, will be occupied by the annual horse show from March 23 to April 11. On April 12 the sculptors can send in the works which are intended for the Salon exhibition.

**Mr. A. G. Temple**, the director of the Guildhall Art Gallery, has accepted an invitation to join the committee for the exhibition to be held at Bruges, under the auspices of the Belgian Government, of the works of early Flemish painters. It is hoped that the Flemish authorities will permit the exhibition of pictures of the kind which are to be found in the museums and churches of Belgium.

**The Will** of the late Mr. John Brett, A.R.A., has been proved at 4,486*l.* 19*s.* 6*d.*

**An Official Difficulty**, which will of course be overcome, arises out of the bequest of the late Thome Thiery to the Louvre. The works of art which he bequeathed are valued at 10,000,000 francs, but as he was a British subject his property is liable to a duty of 18½ per cent. In other words, the Louvre authorities should pay to the Minister of Finance 1,850,000 francs.

**The Council** of the Royal Society decided on January 22 to petition in favour of a charter of incorporation to "The British Academy for the Promotion of Historical, Philosophical and Philological Studies." This petition of the Council of the Royal Society has been drafted, and was laid before the Council for the purpose of being sealed with the seal of the Society last Thursday.

**M. Formigé**, the French architect, has been commissioned to prepare a scheme of decoration for the Salle des Cariatides and the Galerie Lobau in the Hôtel de Ville.

**A New Committee** has been formed, entitled "The Leighton House Concerts and Entertainments Committee," for the purpose of conducting arrangements for all concerts, exhibitions, lectures, &c., that take place in Lord Leighton's studio. It is composed of the following ladies and gentlemen:—Harriet, Countess of Darnley, the Earl of Darnley, the Countess of Darnley, Viscount Barrington, Lady Strachey, Mr. Russell Barrington, Mrs. Russell Barrington, Miss Fortescue Brickdale, Mr. A. G. Temple, Mrs. Whitelegge, Mr. Arthur Bent (director of the concerts), Mr. Windsor Fry, Dr. Ronald Carter. Hon. secretary, Mrs. Russell Barrington.

**An Anglo-American Art Club** for the Riviera has been formed, for the purpose of holding a joint exhibition of the works of British and American artists. The club's first annual exhibition will shortly take place in Cannes.

**Francesco Rava**, the Italian decorative artist, died in London last week of pneumonia. He had lived in England many years and had decorated several large buildings. One of his chief works was the ceilings at Drury Lane Theatre, and decorative paintings from his hand are also to be seen in several hotels and other places.

**The Jury** at the inquest on the fourteen persons killed by the collapse of a floor at Smithfield Mills, Belfast, on January 28, found that no blame attached to any one. The

piers of the building were defective, but it was difficult to detect the weakness.

**The Bournemouth Town Council** have resolved to abandon their sea-water scheme, which has been in existence for upwards of twelve years, on the ground that it has been a failure. The scheme has cost the town nearly 30,000*l.* for machinery, pipes and water towers, but the use of sea water for the roads is not found satisfactory.

**The New Southsea Central Hall** was opened last week. The building has a front elevation of 70 feet, there is a small turret on one side and a cathedral glass window facing the street. Between the two entrances shops are being built and are already let on a lease for three years. There is seating accommodation for about 600 persons, and the schoolroom below is capable of holding 400 children. Both are heated with hot-water pipes and are supplied with electric lighting. Mr. T. Wonnacott, F.R.I.B.A., is the architect, and Messrs. T. Quick & Son, the builders.

**Dr. Charles Porter**, county medical officer of Shropshire, has accepted the post of health officer for Johannesburg at a commencing salary of 2,000*l.* per annum. He took his medical degrees with honours in the Royal University in 1889, is a diplomate in public health of Cambridge University, a barrister-at-law of Gray's Inn, and has had a varied experience of sanitary administration.

**The Margate Town Council** have adopted a scheme devised by the borough engineer (Mr. Albert Latham) to obtain a supply of water from the hills near Wingham, 14 miles from Margate. The scheme is estimated to cost 93,000*l.*, but the Corporation have agreed, in order to avoid opposition, to supply fifteen parishes in the district, and powers are sought in the Bill to borrow 120,000*l.*

**The New Bridge** across the Wey at Guildford was opened on the 6th inst. The bridge, which has been constructed of iron girders of a span of 70 feet, takes the place of the old brick and stone structure which collapsed in the flood at Guildford nearly two years ago. It has been built from designs of Mr. J. Webster by Messrs. Faisey & Son, of Leytonstone, the contract price being 5,396*l.*

**Cardinal Vaughan**, in a preface to a work on "The Holy Rood," by Mr. Dudley Baxter, writes:—"I am not favourable to screens, but I am in perfect accord with St. Charles Borromeo, who laid down in his instructions, that a great crucifix should be placed between the nave and the sanctuary, so as to be visible to the whole congregation, and to dominate the church." It is the Cardinal's intention to give practical effect to his opinion in his new cathedral, as a crucifix of colossal proportions is to be suspended immediately over the sanctuary.

**Mr. Hugh Stannus**, director of architectural studies at the Manchester Municipal School of Technology and the School of Art, on Wednesday gave the first of a course of twenty lectures on the history of architecture in the new school in Whitworth Street.

**Mr. G. Washington Browne**, architect, was on Wednesday elected an associate of the Royal Scottish Academy. The following associates were also elected:—Messrs. Tom Scott of Earlston; George Henry, of Glasgow; R. B. Nisbet, of Comrie.

**The Liverpool Architectural Society** will hold the fourth members' meeting on Monday, February 17, in the Lavender Library, 41 Castle Street, when a paper will be read by Mr. Richard Holt on "Bricks and Brickwork."

**The Institution of Junior Engineers** will on Saturday, February 22, at 3 P.M., visit the new baths and wash-houses of the borough of Fulham, Melmoth Place.

**At a Meeting** of the Royal Philosophical Society of Glasgow to be held on the 17th inst., Professor Cooper, D.D. will read a paper on "An Early Description of an East Syrian Church, with its connected Buildings, from the recently published 'Testamentum Domini,' with some Notices of the Service at that Time."

**A Meeting** of the Glasgow Technical College Architectural Craftsmen's Society was held on Friday evening, the 7th inst., when papers on "Stone" and "Brick" were read by Mr. James S. Robertson and Mr. Robt. Armour respectively. The stones from the best-known quarries of Scotland, with their characteristics, were described, and the manufacture of various types of local brick were also treated of in practical fashion, the whole forming a most instructive evening's study. Votes of thanks were cordially accorded the lecturers.

**The Ceremony** of taking over the Thetford new town hall from the architect and contractors took place on the 29th ult. at a meeting of the Council held in the mayor's ante-room. The proceedings were opened by Mr. Millington, as chairman of the building committee. He said the cost had not yet been finally arrived at, but he believed 10,000*l.* would cover everything. The full figures would be presented in due course.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**ALDERSHOT.**—March 1.—Plans are invited for laying-out as a pleasure ground about 6 acres of land in the centre of Aldershot. Mr. Nelson F. Dennis, A.M.I.C.E., surveyor.

**ALDERSHOT.**—March 29.—Competitive plans are invited for proposed public offices, fire-station and town hall for the town. Premiums of £100, £75 and £50 will be awarded for first, second and third best plans. Mr. Nelson F. Dennis, A.M.I.C.E., surveyor.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

**DUNSTABLE.**—March 14.—Plans are invited, with estimate of expense, for a six-bed infectious diseases hospital to be erected near Dunstable. A premium of 5l. 5s. offered for plans selected. Mr. C. Crichton S. Benning, town clerk, Dunstable.

**HARROGATE.**—May 14.—Competitive designs are invited for a new town hall, the cost of which must not exceed 40,000l. Premiums of 150l., 100l. and 75l. are offered for the three selected designs. Mr. F. Bagshaw, borough engineer, Municipal Offices, Harrogate.

**IRELAND.**—Feb. 26.—A premium of £20 is offered for the best and cheapest report, plans, specification and estimates, &c., for providing the town of Kanturk with a wholesome supply of water. Mr. Mt. Timothy Guiney, clerk to the Kanturk Rural District Council, at the Boardroom of the Workhouse.

**LANGHO.**—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200l., 150l. and 100l. respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**NEW MALDEN.**—March 5.—Designs, &c., are invited for public offices, fire-station, cart sheds, stables and mortuary to be erected at New Malden, Surrey. Total cost of buildings not to exceed 5,100l. Premiums of 25l. and 10l. respectively are offered for the best and second best design. Mr. C. T. Lewis, clerk to The Maldens and Coombe Urban District Council, 7 Market Place, New Malden.

## CONTRACTS OPEN.

**ACCRINGTON.**—Feb. 17.—For erection of shops, offices, stores and assembly-rooms. Messrs. Haywood & Harrison, architects, Post Office Chambers, Accrington.
